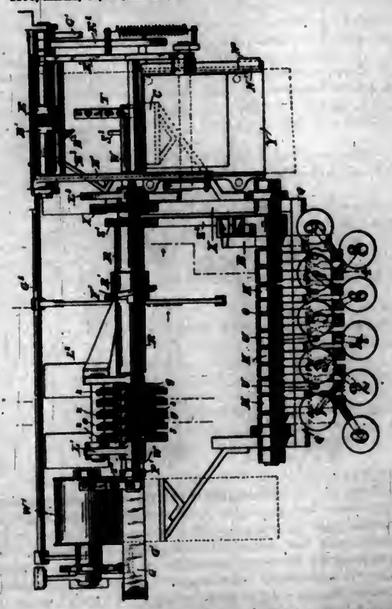
603,841. BLOTTER-BATH AND ABSORBENT COMPOSITION THEREFOR. FRED I. FAIRBANK and THEODORE H. CANTRIL, Des Moines, Iowa. Filed Oct. 26, 1896. Serial No. 610,169. (No model.)

Claim.—1. The herein-described composition of matter, comprising plaster-of-paris, charcoal, sulfur, salt, cement and water in about the proportions stated, substantially as and for the purpose set forth.

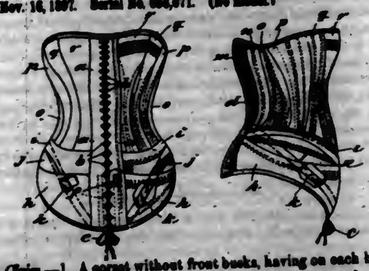


2. A blotter-bath comprising a pan having a transverse partition near one end, an absorbent composition having a flat top surface placed in the pan, a metal cover for the pan having a heavy absorbent filling that has a smooth surface and is adapted to overlie the absorbent in the pan, and the cover, and absorbent therein, adapted to stand on end in the vacant end of the pan, as and for the purpose stated.

3. An absorbent composition for blotter-bath consisting of plaster-of-paris, charcoal and water in about the proportions stated.

4. A blotter-bath, comprising a pan, an absorbent composition having a flat top surface placed in the pan and a cover fitted to the pan and an absorbent composition having a flat surface combined with the cover, for the purposes stated.

603,842. CASH-REGISTER. ADOLF FRAENKEL, Berlin, Germany. Filed July 11, 1896. Serial No. 598,594. (No model.) Patented in Germany Sept. 19, 1894, No. 86,849; in Switzerland Jan. 17, 1896, No. 11,601; in Belgium Feb. 18, 1896, No. 119,494, and in Italy Mar. 31, 1896, XXXI, 49,707, LXXX, 9.



Claim.—1. In a cash-register, the combination of a shaft mounted to turn and to move longitudinally, a numeral-segment mounted on said shaft, means for turning said shaft and for moving the same longitudinally to bring the respective numeral into the printing-line and to place the numerals side by side on the strip beginning with the units, and a counter or totalizer operated by the movements of the shaft, substantially as described.

2. In a cash-register, the combination of a shaft mounted to turn and to move longitudinally, means for turning said shaft and for moving the same longitudinally, a counter or totalizer composed of a series of numeral-disks placed side by side, and operative connections between said shaft and said numeral-disks for operating the latter to add the individual amounts, substantially as described.

3. In a cash-register, the combination of a shaft mounted to reciprocate and to move longitudinally, a numeral-segment attached to said shaft, a series of keys, and operative connections between said keys and the shaft for turning the same and for moving the same longitudinally to bring the respective numeral into the printing-line and to place the numerals side by side on the strip, substantially as described.

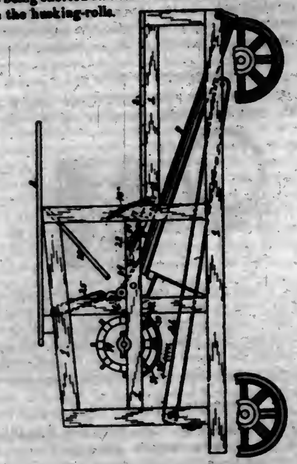
4. In a cash-register, the combination of a shaft mounted to turn and to move longitudinally, a numeral-segment mounted on said shaft, a record-segment mounted on the same shaft, means for turning said shaft and for moving the same longitudinally to bring the respective numeral into the printing-line and to place the numerals side by side on the strip beginning with the units, and a counter or totalizer operated by the movements of the shaft, substantially as described.

603,843. CORSET. JOSEPH A. GARNEAU, St. Roche, Canada. Filed Nov. 16, 1897. Serial No. 658,671. (No model.)

Claim.—1. A corset without front busks, having on each half or section an upright, flexible, marginal band *a* at its front edge, provided with a short and normally stiff curved steel *f*, at its lower part only and terminating above at about the point of greatest projection of the corset to the front, said steel fitting about the lower portion of the abdomen, substantially as set forth.

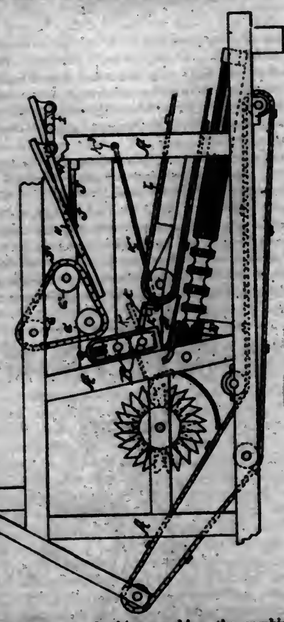
2. A corset having in each half a hip portion formed of the pieces *h* and *i*, extending over the hip from rear to front, and the intermediate gore *j*, of spindle shape, as shown, between and secured to the pieces *h* and *i*, said double-pointed or spindle-shaped gore being in position to rest on and fit over the point of the hip, substantially as set forth.

3. A corset having in each of its halves a hip portion composed of the pieces *h* and *i*, and the intermediate spindle-shaped gore *j*, all secured together, said hip portion extending over the hip from rear to front, and an elastic band *k*, under said hip portion, said band extending from the waist-line at the back to the bottom of the corset in front, passing over the hip, and being free to stretch, substantially as set forth.



4. A corset having in each of its halves an upright marginal band *a*, in front having in its lower part a short steel *f*, with a set curvature, an upright marginal band *d*, at the back, having steels *g*, with a set curvature, extending their entire length, a hip-piece *h*, widest at its ends and extending from one to the other of said marginal bands, a piece *i*, over the hip and extending from one to the other of said bands, a spindle-shaped intermediate gore *j*, between the pieces *h* and *i*, and these pieces and the gore secured together at their edges, the upright pieces *m*, *n*, *o*, *p*, *q* and *r*, of the contour shown, forming the body above the waist, and means for closing the corset at the front and back, substantially as set forth.

603,844. CORN-HUSKING MACHINE. GILBERT S. GREGORIUS, Dayton, Ohio. Filed May 4, 1896. Serial No. 590,266. (No model.)



Claim.—1. In a corn-husker, a mapping-roll provided with a series of annular grooves and a series of rings having flat peripheries, and a transverse rib in each of said grooves, in combination with a companion roller of similar construction arranged parallel with the first-named roll and in a reversed position so that the grooves on one roll will be in line with the rings on the other.

2. In a corn husker and shredder, the combination of mapping-rolls having a series of annular grooves intersected by ribs that are placed spirally around said roll, and a series of intervening rings with flat peripheries, a companion roll of similar construction placed in a reversed position to the first-named roll so as to bring the grooves of one roll opposite the rings of the other, whereby a zigzag opening and a corresponding straight surface are provided throughout the length of said rolls, and means for enabling the feeder to feed stock to said rolls from a central part of the machine.

3. In a corn-husking machine, the combination with husking-rolls, of husk-loosening rolls provided with teeth, and flexibly mounted above and parallel with the husking-rolls, the said husk-loosening rolls being rotatable in opposite directions so as to simultaneously remove the husks from two sides of the ear, and thereby prevent undue pressure being exerted on one side of an ear of corn to remove it from between the husking-rolls.

603,845. CORN-HUSKING MACHINE. GILBERT S. GREGORIUS, Middletown, Ohio. Filed Oct. 11, 1897. Serial No. 654,770. (No model.)

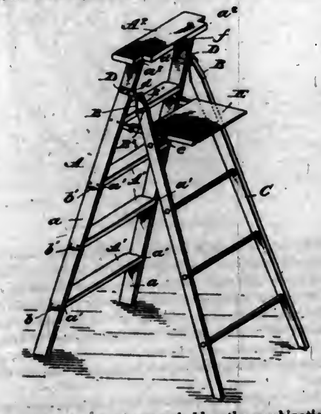
Claim.—1. In a corn-husking machine, the combination with mapping-rolls mounted across the machine, of a rotary feeding-apron mounted above said rolls, reciprocating feed-boards mounted on an incline in front of said feed-apron, the lower ends of said feed-boards being movable below the lower end of the feed-apron, springs upon which said feed-boards are held, and a crank-shaft to which the feed-boards are connected, and whereby said feed-boards are given an alternately-reciprocating motion, substantially as and for the purposes specified.

2. In a corn-husking machine, the combination with mapping-rolls mounted across the machine, of a rotary feed-apron mounted above said mapping-rolls with its lower end surrounding two rollers

so as to provide a substantially broad working surface, reciprocating feed-boards mounted on an incline in the front of said feed-apron, the lower ends of said boards being movable below the lower end of the apron, springs to apply a yielding pressure to said boards, and a crank-shaft to which said boards are connected, and whereby they are driven alternately in opposite directions to feed in a continuous manner the stock to the snapping-rolls, as herein shown and described.

603,846. PATCH FOR PNEUMATIC TIRES. JOHN R. HARR, Baltimore, Md. Filed June 10, 1897. Serial No. 640,193. (No model.)

Claim.—In a hose-patch, a flexible band having at one end a curved plate with hooks at its extremity, and at the other end a link, and a curved plate with lugs to which the said link is pivoted, the inner end of the second plate being adapted to engage with the hooks on the first, whereby the second plate is made to perform the function of a lever in the application of the device to a hose, substantially as specified.

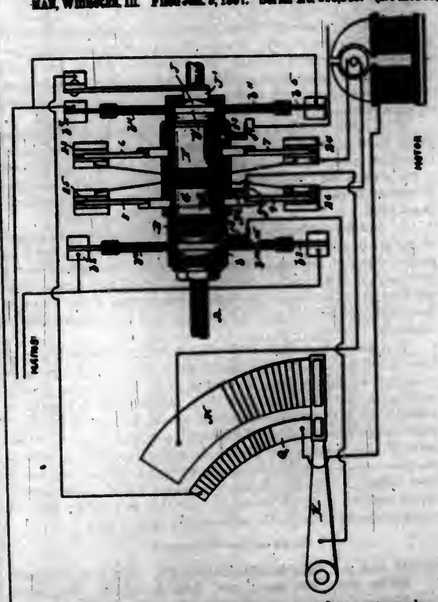


603,847. POCKET-KNIFE. JOHN F. HARVEY, Johnsonburg, Pa. Filed June 2, 1897. Serial No. 639,160. (No model.)

Claim.—1. In a pocket-knife as specified, the combination with the body 1 having a central division 1^c, the knife-blades held in the upper face of such body, said blades and central member having pintle-apertures provided with lateral notches 5^c 5^c, a body having sockets 1^a and 6^a and the pintle 6 having lugs 6^c 6^c and meahs for holding such pintle normally in a locked engagement with the blades as shown and described.

2. The combination with the body member having a knife-socket in its upper edge, a lateral socket 1^a and 6^a, blades 3 and 4 having a pintle-aperture provided with lateral notches 5^c 5^c, of the pintle, said pintle-aperture having a lug 6^c adapted to engage the notches in the blade 4 and a lug 6^c of greater width than the blade 3, whereby it will normally project into the socket 1^a and hold the pintle from turning, said pintle having endwise movement in the blade and in its bearings in the body 1, the spring for holding such body to its normal position, all being arranged substantially as shown and for the purposes described.

603,848. EXTENSION STEP-LADDER. PHILIP HERDER, Cleveland, Ohio. Filed Sept. 20, 1897. Serial No. 652,396. (No model.)



Claim.—1. In an extension step-ladder, the combination with a section A having a platform which extends beyond and over the side pieces of the ladder, said platform being cut away to provide shoulders, a ladder-section C pivotally attached to the section A, a shelf pivotally attached to the section A and provided with lugs for engagement with the upper rung of the section C, and a turn-button on said platform which is adapted to engage with the shelf and with the upper rung of said section, substantially as shown and for the purpose set forth.

2. In an extension step-ladder, the combination with the section A fixtures attached thereto the same having projecting portions which engage with the edges of the side pieces and rearwardly-extending portions with apertures, of the prop-section the side bars, and with fixtures which embrace the ends thereof, and bolts for holding the fixtures in pivotal engagement, substantially as shown.

3. In an extension step-ladder, the combination with the step and prop sections, of fixtures carried by said sections, one of the fixtures having members *d d* which lie over the edges of the step-section and an apertured member which projects rearward therefrom, the fixture on the other section each having a flange which lies over the upper end thereof, said fixture having cross-bars; together with the connecting-bolts, substantially as shown and for the purpose set forth.

4. The combination in a step-ladder having a step-section and a prop-section connected to each other at a point midway between the upper step of the step-section and the platform thereof, a shelf pivoted to the ladder-section and provided with fixtures for engagement with the upper rung of the prop-section, said upper rung being so positioned that when the prop-section is turned upon its pivots upward, said rung will lie over the platform and a turn-button carried by the platform, substantially as shown and for the purpose set forth.

603,849. SWITCH FOR ELECTRIC MOTORS. FRANK R. HERRMAN, Winnetka, Ill. Filed Jan. 9, 1897. Serial No. 618,512. (No model.)

Claim.—1. The combination with a source of current-supply and an electric motor, of a switch interposed between the source of current-supply and the motor, one portion of said switch being adapted to make electrical connection with the source of current-supply, the other portion being adapted to make electrical connection with the armature, and both portions of said switch being adapted to make electrical connection with the field, means to operate said switch to move the portion of the switch connecting with the current-supply to and from central position without moving the other portion of said switch.

2. The combination with a source of current-supply and an electric motor, of a switch interposed between the source of current-supply and the motor, one portion of said switch being adapted to make electrical connection with the source of current-supply, the other portion being adapted to make electrical connection with the armature, and both portions of said switch being adapted to make electrical connection with the field, the first-mentioned part of said switch being loosely connected to the last-mentioned part of the switch, so that the first-mentioned part has a movement to and from central position independent of the other part.

3. The combination with a source of current-supply and an electric motor, of a shaft, a switch interposed between said source of current-supply and the motor, consisting essentially of a hub upon said shaft, switch mechanism connected to said hub adapted in its movement to make and break connection with the source of current-supply, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to the said hub, connection between said cam and said forks, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

4. The combination with a source of current-supply and an electric motor, of a shaft, a switch interposed between said source of current-supply and the motor, consisting essentially of a hub upon said shaft, switch mechanism connected to said hub adapted in its movement to make and break connection with the source of current-supply, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to the said hub, loose connection between said cam and the shaft-fork and said forks, the connection between said cam and the shaft-fork being in the lead of the connection between said cam and the hub-shaft, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

5. In combination with a source of current-supply and an electric motor, of a switch interposed between the source of current-supply and the motor, consisting of two portions, one portion of which is loosely connected to the other portion, whereby the first-mentioned portion may be moved a predetermined distance independent of the other portion, the first-mentioned portion being adapted in its movement to make and break connection with the source of current-supply, the other portion being adapted in its movement to make and break and reverse the electric connection with the armature of the motor and electrical connection between the field and both portions of the switch.

6. In combination with a source of current-supply and an electric motor, a switch interposed between the source of current-supply and the motor consisting of two portions, one portion of which is loosely connected to the other portion, whereby the first mentioned portion may be moved a predetermined distance independent of the other portion, the first-mentioned portion being adapted in its movement to make and break connection with the source of current-supply, the other portion being adapted in its movement to make and break and reverse electric connection with the armature of the motor, and electrical connection between the field and both portions of the switch, a shaft upon which said switch is loosely mounted, a hub upon said shaft to which the switch mechanism is connected, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to the said hub, connection between said cam and said forks, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

7. The combination with a source of current-supply and an electric motor, of a switch interposed between the source of current-supply and the motor consisting of two portions, one portion of which is loosely connected to the other portion, whereby the first-mentioned portion may be moved a predetermined distance independent of the other portion, the first-mentioned portion being adapted in its movement to make and break connection with the source of current-supply, the other portion being adapted in its movement to make and break reverse electric connection with the armature of the motor, and electrical connection between the field and both portions of the switch, a hub to which said switch mechanism is connected, a shaft upon which said hub is loosely mounted, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to said hub, connection between said cam and said forks, the connection between said cam and the shaft-fork being in the lead of the connection between said cam and the hub-shaft, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

8. A source of current-supply, an electric motor, a switch consisting of two parts having a loose connection, one part controlling the connection of the source of current-supply and the field directly and the connection of the source of current-supply and the armature through the medium of the second part, the second part controlling the electrical connection with the armature, the first-mentioned part having a predetermined movement independent of the second part.

9. A switch for an electric device consisting essentially of two parts having a loose connection, a shaft upon which said switch is loosely mounted, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to one part of said switch, loose connection between said cam and said forks, the connection between said cam and the shaft-fork being in the lead of the connection between said cam and the hub-shaft, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

10. A switch for an electric device consisting essentially of two parts having a loose connection, a shaft upon which said switch is loosely mounted, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to one part of said switch, loose connection between said cam and said forks, the connection between said cam and the shaft-fork being in the lead of the connection between said cam and the hub-shaft, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

11. In combination, a source of current-supply, a reversing-switch, an electric motor and electric connection between the source of current-supply and the field and armature of the motor, an electrical circuit including the field and armature of the motor through the reversing-switch, and means to make and break connection between the motor and source of current-supply and maintain a single circuit through the reversing-switch including the field and armature.

12. In combination, a source of current-supply, a reversing-switch, an electric motor and electric connection between the source of current-supply and the field and armature of the motor in shunt, an electrical circuit including the field and armature of the motor in series through the reversing-switch, and means to make and break connection between the motor and source of current-supply and maintain a single circuit through the reversing-switch including the field and armature.

13. The combination with a source of current-supply and an electric motor, of a shaft, an interposed switch consisting of a hub loose upon said shaft having two portions insulated from each other, sleeves as F and G upon and loosely connected to said hub, the sleeve F being in electrical connection with one portion of said hub, but insulated from the sleeve G, the sleeve G being insulated from the hub, blades as b b' connected with the hub, fingers or equivalent contact, as b^3 and b^4, in electrical connection with one pole of the source of current-supply, said fingers coacting with the blade b, fingers or equivalent contact, b^1, b^2, in electrical connection with the other pole of current-supply, said fingers coacting with the blade b', a blade as 14 connected with the portion of the hub carrying the blade b, a finger 15 contacting with said blade, blades 6 and 7 connected to sleeve F, brushes 23 and 24 adapted to contact with blades 6 and 7 respectively, blade f^6 connected to said sleeve F, and finger f^4 contacting with said blade, brushes as 8 and 9 connected to said sleeve G, blade g^6 connected to said sleeve, and finger g^4 connecting with said blade g^5, electric connection between contact 15 and one side of the field and finger g^4 in shunt, electric connection between the other side of the field and finger f^4, electric connection between brushes 23 and 26, and brushes 24 and 25 and electrical connection between said brushes and the armature.

14. The combination with a source of current-supply and an electric motor, of a shaft, an interposed switch consisting of a hub loose upon said shaft having two portions insulated from each other, sleeves as F and G upon and loosely connected to said hub, the sleeve F being in electrical connection with one portion of said hub but insulated from the sleeve G, the sleeve G being insulated from the hub, blades as b b' connected with the hub, fingers or equivalent contact as b^3 and b^4 in electrical connection with one pole of the source of current-supply, said fingers coacting with the blade b, fingers or equivalent contacts as b^1 b^2 in electrical connection with the other pole of current-supply, said fingers coacting with the blade b', a blade as 14 connected with the portion of hub carrying the blade b, a finger 15 contacting with said blade, blades 6 and 7 connected with sleeve F, brushes 23 and 24 adapted to contact with blades 6 and 7 respectively, blade f^6 connected to said sleeve F, and finger f^4 contacting with said blade, brushes as 8 and 9 connected to said sleeve G, blade g^6 connected to said sleeve, and finger g^4 connecting with said blade g^5, electric connection between contact 15 and one side of the field and finger g^4 in shunt, electric connection between the other side of the field and finger f^4, electric connection between brushes 23 and 26, and brushes 24 and 25, and electrical connection between said brushes and the armature, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to said hub, loose connection between said cam and said forks, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

15. The combination with a source of current-supply and an electric motor, of a shaft, an interposed switch consisting of a hub loose upon said shaft having two portions insulated from each other, sleeves as F and G upon and loosely connected to said hub, the sleeve F being in electrical connection with one portion of said hub but insulated from the sleeve G, the sleeve G being insulated from the hub, blades as b, b' connected with the hub, fingers or equivalent contact as b^3 and b^4 in electrical connection with one pole of the source of current-supply, said fingers coacting with the blade b, fingers or equivalent contact as b^1 b^2 in electrical connection with the other pole of

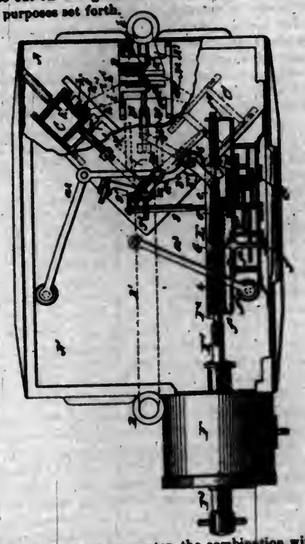
current-supply, said fingers coacting with the blade *b'*, a blade as 14 connected with the portion of hub carrying the blade *b*, a finger 15 contacting with said blade, blades 6 and 7 connected to sleeve F, brushes 23 and 24 adapted to contact with blades 6 and 7 respectively, blade f^3 connected to said sleeve F, and finger f^4 contacting with said blade, brushes as 8 and 9 connected to said sleeve G, and blade g^3 connected to said sleeve, and finger g^4 connecting with said blade g^3, electric connection between contact 15 and one side of the field and finger g^4 in shunt, electric connection between the other side of the field and finger f^4, electric connection between brushes 23 and 26, and brushes 24 and 25, and electrical connection between said brushes and the armature, a cam having high and low points loose upon said shaft, forks between which said cam rests, one of said forks being secured to said shaft, the other to said hub, loose connection between said cam and said forks, the connection between said cam and the shaft-fork being in the lead of the connection between said cam and the hub-shaft, a roller resting upon said cam, and a spring or equivalent device acting upon said roller.

16. In combination, a source of current-supply, an electric motor, an interposed switch controlling the admission of current from the source of supply to the motor, a brush carried by said switch in electrical connection with one side of said field, and a contact in electrical connection with the other side of the field, the contact being of length sufficient to maintain contact with the brush during the movement of said switch and break contact when the switch has closed connection between the source of current-supply and motor.

17. The combination with a source of current-supply and an electric motor, of switch-operating mechanism, a switch interposed between said source of supply and the motor, consisting of switch mechanism adapted in its movement to make and break connection with the source of current-supply, a cam having high and low points, a device pressed against said cam, means between the switch-operating mechanism and the cam whereby a movement of the switch-operating mechanism causes the high point of said cam to move against said device, a loose connection between said cam and the switch mechanism.

18. The combination with a source of current-supply and an electric motor, of a shaft, a switch interposed between said source of supply and the motor, consisting of a hub upon said shaft, switch mechanism connected to said hub adapted in its movement to make and break connection with the source of current-supply, a cam having high and low points loose upon said shaft, a tension device resting upon said cam, means between the shaft and the cam whereby a movement of the shaft will move the cam into position to be actuated by said tension device, and a loose connection between said cam and said hub.

19. The combination with a source of current-supply and an electric motor, of switch-operating mechanism, a switch interposed between said source of supply and the motor consisting of switch mechanism adapted in its movement to make and break connection with the source of supply, a cam having high and low points, a tension device resting against said cam, means between the switch-operating mechanism and the cam whereby a movement of the switch-operating mechanism will move the cam into position to be actuated by said tension device, and a loose connection between the cam and the switch mechanism whereby the cam when actuated will move a determinate distance before throwing the switch mechanism into action to make or break the circuit from the source of supply.



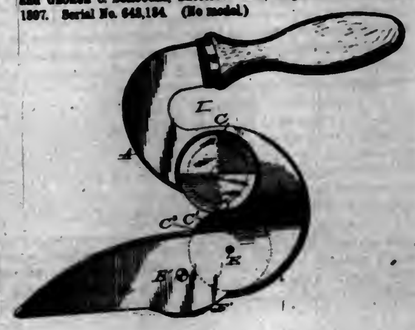
608,850. PREPAYMENT GAS-METER. CHARLES W. HISHAM, Boston, Mass. Filed Sept. 8, 1896. Renewed Nov. 11, 1897. Serial No. 658,205. (No model.)

Claim.—1. In a prepayment gas-meter, the combination with coin-controlled mechanism, and supply-controlling mechanism, of a valve operating to cut off the gas in the frog-chamber, and arranged to be closed by the supply-controlling mechanism; substantially as described.

2. In a prepayment gas-meter, the combination with coin-controlled mechanism, and a supply-controlling mechanism, of a valve operated in the valve-chamber by the supply-controlling mechanism and arranged to cut off the gas in the frog-chamber; substantially as described.

3. In a prepayment gas-meter the frog-chamber provided with a partition, and with two ports or slots one on each side of said partition opening into the valve-chamber, in combination with a valve arranged to control said ports and supply-controlling mechanism connected to operate said valve, substantially as described.

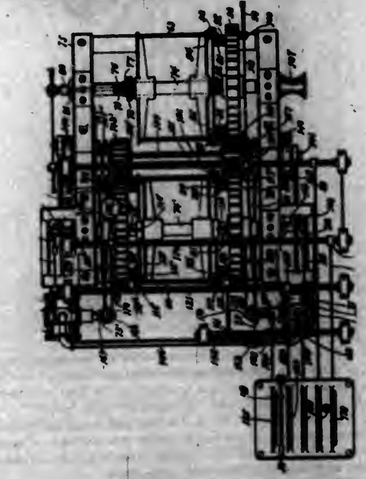
4. In a prepayment gas-meter, the combination with coin-controlled mechanism and supply-controlling mechanism, of a valve adapted to cut off the gas in the frog-chamber, a carrier adapted to move in one direction when one of said mechanisms is actuated and in the opposite direction when the other of said mechanisms is actuated, and means whereby said carrier, upon reaching the extreme of its movement by operation of the supply-controlling mechanism, moves said valve to cut off the gas in the frog-chamber; substantially as and for the purposes set forth.



5. In a prepayment gas-meter, the combination with coin-controlled mechanism and supply-controlling mechanism of a valve adapted to cut off the gas in the frog-chamber and to let it on again, a carrier adapted to move in one direction when one of said mechanisms is actuated and in the opposite direction when the other of said mechanisms is actuated, means whereby said carrier upon reaching the extreme of its motion by operation of the supply-controlling mechanism moves said valve to cut off the gas in the frog-chamber, and means whereby said carrier upon receding from said extreme by operation of the coin-controlled mechanism moves said valve to let on the gas again in the frog-chamber; substantially as and for the purposes set forth.

6. In a prepayment gas-meter, the valve-chamber A, and frog-chamber, A^2 A^3, separated by a partition *d*, and connected by passages *d'* in combination with the valves C C' and slide-valve D arranged to control the passages *d'* and connected to be operated by supply-controlling mechanism, substantially as described.

7. In a prepayment gas-meter the valve-chamber A provided with valves C C' and formed with passages *d'* *d'* to the frog-chamber, and provided with a two-way race d^3, in combination with a partition *d*, in the frog-chamber intermediate of said passage *d'*, and a slide-valve D, for controlling said passages and connected to be operated by the supply-controlling mechanism; substantially as described.



8. The combination in a gas-meter of the valve-chamber A, slide-valves C, C', therein, the frog chamber A^2, A^3, below the floor B^2, the partition *d*, slots or ports *d'* *d'* in said floor one each side of the partition and a valve arranged to control said slots or ports, substantially as described.

608,851. APPARATUS FOR CUTTING CLOTH. JOHN JACKSON and GEORGE C. BONCOMPS, Battersea Rise, England. Filed Aug. 13, 1897. Serial No. 648,184. (No model.)

Claim.—In an apparatus for cutting cloth, the combination with a suitable frame, a thumb-screw arranged therein and having a hollow shank, conically-pointed journal-pins one of the same being fixed and the other arranged movably in the hollow shank of said screw, and a helical spring also arranged in the hollow shank of said screw and acting on said movable journal-pin, of a driving-wheel, cutter-disks having conical bearings receiving the conically-pointed journal-pins, and suitable gearing between the driving-wheel and one of said cutter-disks, substantially as set forth.

608,852. APPARATUS FOR ELEVATING, TRANSPORTING, AND DISCHARGING MATERIAL. OLE JOHNSON, Milwaukee, Wis. Filed July 12, 1897. Serial No. 644,103. (No model.)

Claim.—1. In an apparatus for elevating, transporting and delivering material, the combination, of a cable or track, a carriage adapted to travel on said track, a bucket, cables connected, to the bucket and extending to the carriage, and thence from said carriage in opposite directions, shafts having drums slidingly mounted thereon, and to which drums the respective cables are connected, a gear-wheel loose on one of said shafts, clutch mechanism whereby the drum of this shaft may be connected to the gear-wheel, gear-wheels loose on the other shaft, clutch mechanisms for connecting the drum of this latter shaft to either of the loose gear-wheels, a main driving-shaft having pinions mounted thereon, one of said pinions engaging a gear-wheel on each of the drum-shafts, and an intermediate pinion with which the other pinion of the driving-shaft meshes, said intermediate pinion meshing with the second gear-wheel on one of the drum-shafts.

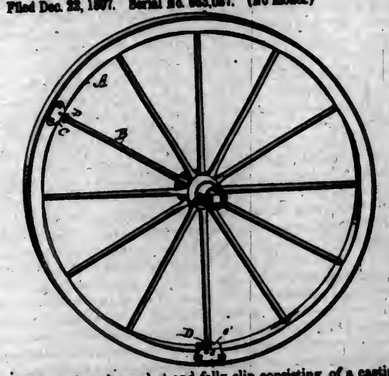
2. In an apparatus for elevating, transporting and delivering material, the combination, of a cable or track, a carriage adapted to travel on the track, a cable connected to the forward end of the carriage, and thence extended for connection to the rear end of the carriage, pulleys around which the cable is wound a plurality of times, a lever mounted on a shaft, a brake-band surrounding one of the pulleys, said brake-band having its opposite ends secured to the shaft, mechanism engaging the lever, and when operated in one direction adapted to turn the shaft so as to normally hold the brake-band out of engagement with one of the pulleys, and when operated in the opposite direction adapted to turn the shaft so as to release the brake-band, cables connected to the bucket, drums to which the opposite ends of the cables are connected, driving mechanism, a clutch mechanism between the drums and the driving mechanism, whereby said drums may be both put into clutch with the driving mechanism, or one separately, or one or both drums thrown out of clutch.

3. In an apparatus for elevating, transporting, and delivering material, the combination, of a cable or track, a carriage adapted to travel on said track, a bucket, a cable connected to the bucket and extending to the carriage, and thence from said carriage, a shaft provided with a tubular portion extending inwardly for a desired distance, a drum mounted loosely on said shaft, and to which the cable is connected, a driven wheel mounted on the shaft, a screw-rod passing through a fixed nut and adapted at its inner end to bear against the drum, means for turning the screw-rod so as, when turned in one direction, to cause said rod to slide the drum longitudinally on its shaft, clutch mechanism between the drum and the gear-wheel, and a coiled spring encircling the shaft and confined between the gear-wheel and the drum, said spring adapted, when the screw-rod is turned in the opposite direction, to force the drum out of engagement with the clutch.

4. In an apparatus for elevating, transporting, and delivering material, the combination, of a cable or track, a carriage adapted to travel on said track, a cable connected to the bucket and extending upwardly to the carriage, and thence from said carriage, a shaft provided with a tubular portion extending inwardly for a desired distance, a drum mounted loosely on said shaft and to which the cable is connected, a driven wheel mounted on the shaft, a screw-rod passing through a fixed nut and adapted at its inner end to bear against the drum, an arm connected to the screw-rod, a rock-shaft, an arm mounted medially thereon, a rod connecting one end of this arm with the screw-rod, whereby when the rock-shaft is turned the arm medially mounted thereon will, through the connecting-rod, cause a rotation of the screw-rod, which when rotated in one direction, will bear against the drum and slide said drum longitudinally on its shaft, clutch mechanism between the drum and the driven wheel, a brake-band surrounding the drum, one end of said band being connected to a fixed point, a rocking arm to which the opposite end of the band is connected, and a rod connecting said arm with the other end of the arm which is medially mounted on the rock-shaft.

5. In an apparatus for elevating, transporting, and delivering material, the combination, of a cable or track, a carriage adapted to travel on said track, a bucket, a cable connected to the bucket and extended upwardly to the carriage, thence forwardly from the carriage, a shaft having opposite ends tubular for a desired distance inwardly, a drum loosely mounted on said shaft, gear-wheels mounted on the shaft, screw-rods passing through fixed nuts and entering the tubular ends of the shaft, means for turning said screw-rods, so as to threw one or the other into engagement with the drum, in order to slide said drum longitudinally in either direction on its shaft into engagement with either of the gear-wheels, a driving-shaft, pinions mounted thereon, one of said pinions adapted to mesh directly with one of the gear-wheels of the shaft, another pinion on a separate shaft, which pinion meshes with the other gear-wheel, and also with the other pinion of the driving-shaft.

6. In an apparatus for elevating, transporting, and delivering material, the combination, of a cable or track, a carriage adapted to travel on said track, a bucket having a pivoted bottom, cables connected to the bucket, one of said cables connected to a fixed point of the bucket and extending upwardly to the carriage and thence rearwardly, and the other cable connected to the bucket so as to operate on the pivoted bottom thereof to effect the opening and closing of the pivoted bottom, said cable extending upwardly from the bucket to the carriage, and thence forwardly from the carriage, shafts, one of said shafts having one end tubular for a desired distance inwardly, and the other of said shafts having both ends tubular for a desired distance inwardly, drums mounted loosely on said shafts, and to which the respective cables are connected, a gear-wheel mounted on one of the shafts, two gear-wheels mounted on the other of said shafts, a rod screwing through a fixed nut and entering the tubular end of one of the shafts, and adapted to bear against the end of the drum, means for turning said rod so as to slide the drum longitudinally on its shaft, clutch mechanism between this drum and the gear-wheel, rods screwing through fixed nuts and entering the tubular ends of the other shaft, means for turning said rods, so as to cause one to be screwed inwardly to bear against the inner end of the drum and slide said drum longitudinally on its shaft, and the other to be simultaneously screwed outwardly, clutch mechanism between the opposite ends of the drum and the gear-wheels, a driving-shaft having pinions mounted thereon, one of said pinions meshing with the single gear-wheel of one shaft and one of the gear-wheels of the other shaft, and the other pinion meshing with an intermediate pinion between it and the other gear-wheel, a cable connected to the forward end of the carriage, and thence extended for connection to the forward end of the carriage, and means for preventing the movement of said cable, in order to hold the carriage in adjusted position.

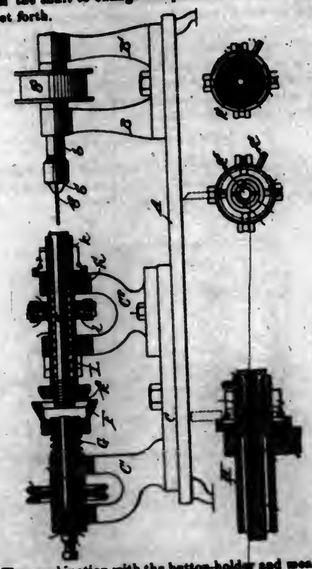


7. In an apparatus for elevating, transporting and delivering material, the combination, of a cable or track, a carriage adapted to travel on said track, a bucket having a pivoted bottom, cables connected to the bucket, one of said cables connected to a fixed point of the bucket and extending upwardly to the carriage and thence rearwardly, and the other cable connected to the bucket so as to operate on the pivoted bottom thereof to effect the opening and closing of the pivoted bottom, said cable extending upwardly from the bucket to the carriage, and thence forwardly from the carriage, shafts, drums mounted loosely on said shafts and to which the respective cables are connected, a gear-wheel mounted on one of the shafts, means for clutching and unclutching the drum to and from this gear-wheel, two gear-wheels mounted on the other of said shafts, means for clutching and unclutching the drum of this shaft with either of

the two gear-wheels of said shaft, a driving-shaft having pinions mounted thereon, one of said pinions meshing with the single gear-wheel of one shaft, and one of the gear-wheels of the other shaft, and the other pinion of said shaft meshing with an intermediate pinion between it and the other gear-wheel, said intermediate pinion being in mesh with the other gear-wheel, a cable connected to the forward end of the carriage and thence extended for connection to the rear end of said carriage, and means for preventing the movement of the cable in order to hold the carriage in adjusted position, the construction adapting the bucket to be lowered and the pivoted bottom opened and subsequently closed when the bucket is filled, and also adapting said bucket to be raised in a vertical line to a certain height, and thence the carriage caused to travel longitudinally, and the bucket to be simultaneously elevated at an angle, and when elevated to a desired height, the two to travel together longitudinally, and said construction also adapted to permit the bucket to be lowered either in a straight line or at an angle, and the pivoted bottom to be opened for the discharge of the material, and the longitudinal travel of the carriage to be reversed after final discharge and subsequent elevation of the bucket.

8. The combination, of a driving-shaft, sets of eccentrics mounted thereon, a double engine mechanism, a rotatable valve for controlling said engine mechanism, crank-arms extending from the valve-rods of the double engine mechanism, frames provided with elongated slots, blocks fitting in said slots, pins extending from the crank-arms of the valve-stems and passing into apertures in the blocks, rods extending respectively from the eccentrics to upper and lower pins of the slotted frames, a rock-shaft, arms mounted medially thereon, weights on said arms, rods connecting the arms with the slotted frames, another arm mounted on a rock-shaft, an operating-lever, and a rod connecting said operating-lever with the other arm of the rock-shaft.

9. In an apparatus for elevating, transporting and delivering material, the combination, of a tower, a boom pivoted to the tower so as to swing upwardly and downwardly, a cable or track, a carriage adapted to travel on the track, a cable connected to the forward end of the carriage and thence extended forwardly and around a grooved pulley at the outer end of the pivoted boom, thence upwardly over a pulley at the upper end of the tower, and finally connected to the rear end of the carriage, cables connected to the bucket and extended upwardly to the carriage, and from said carriage in opposite directions, one of said cables passing over a pulley at the end of the pivoted boom, and thence upwardly and around a pulley at the upper portion of the tower, and drums to which the ends of said cables are connected.



608,853. SPOKE-SOCKET. WILLIAM O. JONES, Marcy, N. Y. Filed Dec. 22, 1897. Serial No. 663,037. (No model.)

Claim.—A spoke-socket and felly-clip consisting, of a casting or forging having side flanges to embrace the felly, a connecting-web with an aperture, one of the side walls of which is inclined and a half-section of a spoke-embracing socket, a separate casting or forging, having a socket-section and lug adapted to fit within the aperture in the web of the other section, the parts having registering perforations through which bolts or rivets pass in order to connect the portions to each other and to the spoke and felly, substantially as shown.

608,854. BUTTON-BORING MACHINE. WILLIAM H. LEHMAN and GEORGE W. LEHMAN, New York, N. Y. Filed Jan. 13, 1896. Serial No. 666,220. (No model.)

Claim.—1. The combination with the holder and means for reciprocating it in a longitudinal direction, of a continuously-rotating shaft and means for temporarily clutching the holder to and releasing it from the shaft to change the position of the button, substantially as set forth.

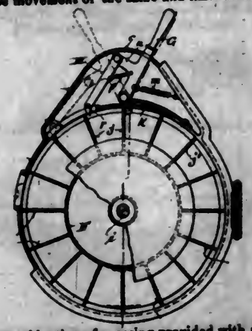
2. The combination with the button-holder and means for rotating it, of stop-dogs for arresting the rotary movement of the holder and means for bringing different numbers of the dogs into operative position relative to the holder, substantially as set forth.

3. The combination with the holder and means for rotating it, of stop-dogs pivoted in position to swing into and out of operative position and a spring-band for holding them in and out of operative position, at pleasure, substantially as set forth.

4. The combination with the holder and means for rotating it, of a stop-dog having a beveled end, a cam, stops on the shaft in position to coact with the beveled end of the dog and with the cam to free the shaft from the dog and means for reciprocating the receiving-holder to bring the stops into engagement with the dog and cam to free the shaft from the dog and permit it to rotate, substantially as set forth.

5. The combination with the holder and means for reciprocating it in a longitudinal direction, of a stop on the shaft, a cam with which the stop engages and a slot for receiving the stop as it leaves the cam to lock the holder against a rotary movement during the boring operation, substantially as set forth.

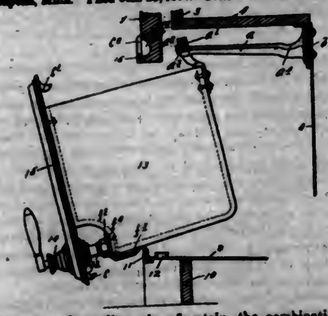
6. The combination with the longitudinally-reciprocating and rotary holder, a rotary shaft and means for clutching the holder to and releasing it from the rotary shaft, of an adjustable stop seated in the rotary shaft for moving the holder relative to its support to release the button, substantially as set forth.



7. In a button-boring machine, the combination with the expansible and contractible holder, of an ejector seated within the holder, comprising a spring and a disk carried thereby, the said disk being adapted to press against the button when the holes are being bored to prevent the chipping of the button, substantially as set forth.

608,855. PASSENGER-CAR APPURTENANCE. ELIAS F. MATHENY, Milwaukee, Wis., assignor to David D. Matheny, Cuba, Ill. Filed Jan. 22, 1898. Serial No. 667,547. (No model.)

Claim.—1. The combination of an open-side casing provided with an inlet-aperture, a closure-plate for the casing, means for locking the plate to the casing, a pocket-wheel mounted in said casing, a lever mechanism operative to impart intermittent rotation to the wheel, and a detent operative in conjunction with said wheel to check reverse movement of same and limit its revolution.



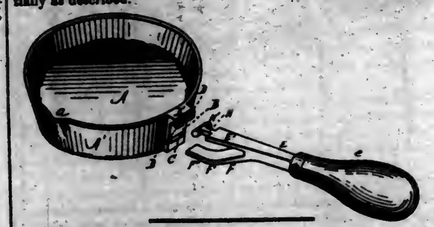
2. The combination of an open-side casing provided with an inlet-aperture and an observation-aperture, a closure-plate for the casing, means for locking the plate to the casing, a pocket-wheel mounted in the casing, and provided with an indicator having display through said observation-aperture, a lever mechanism operative to impart intermittent rotation to the wheel, and a detent operative in conjunction with said wheel to check reverse movement of the same and limit its revolution.

3. The combination of an open-side casing provided with an inlet-aperture, a housing surmounting the casing, a closure-plate for said casing means for locking the plate in place, a pocket-wheel mounted in the casing and provided with an indicator having display through an opening in the aforesaid casing, a spring-controlled lever fulcrumed in the housing and extended through a slot in the same, a dog in spring-controlled pivotal connection with the lever and extended through a slot in the casing periphery to operate against radial partitions of said wheel, dog-lugs arranged to ride on said casing periphery, and a detent operative in conjunction with said wheel to check reverse movement of the same and limit its revolution.

4. The combination of a casing provided with an inlet-aperture and an observation-aperture, a series of radial pockets within the casing, means for obtaining successive registration of the pockets with said inlet-aperture, and an indicator having display through said observation-aperture to tally the registrations of said pockets and inlet-aperture.

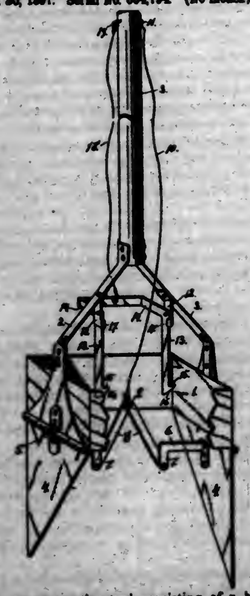
608,856. SODA-WATER FOUNTAIN. ROBERT B. MOWRY, Minneapolis, Minn. Filed Jan. 25, 1897. Serial No. 620,603. (No model.)

Claim.—1. In a dispensing-fountain, the combination with a syrup-can, of an overhead or top support for the can, and a hanger suspending the can from said support, with said parts constructed and arranged to permit the can to travel, on said support, and to permit the can to tilt downward when in its outermost or filling position, substantially as described.



2. The combination with the syrup-can 13, of the overhead or top support *a*, provided with the outer-end depression a^3 and the inner-end depression a^4, the hanger *a'*, secured to the back of the can and embracing said support, and the roller a^5 secured to said hanger and traveling on said support, substantially as described.

3. The combination with the syrup-can 13, having the hanger *a'* with roller a^5, of the overhead or top support *a* having the depressions a^3 and a^4, and the face-plate 15 secured to the front wall of the can and provided with the lock-lugs *c'*, engageable over the plates 11 and 16, substantially as described.

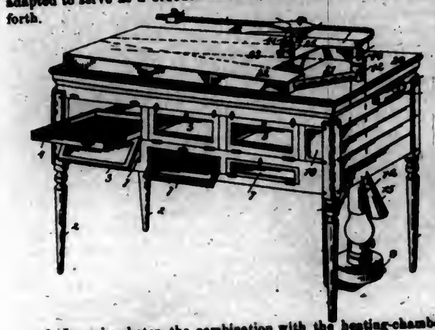


4. In a dispensing-fountain, the combination with the syrup-can, of a draft device having the parts *f' f'' f'' f''' f''* which operate as a rigid pipe-coupling and clamping device for securing the draft device to the can, substantially as described.

608,857. FRYING-PAN AND LIFTER. BENJAMIN PIERCE, Sandwich, Mass. Filed Jan. 30, 1896. Serial No. 627,128. (No model.)

Claim.—In combination, the pan A, A' formed on the outer surface of its side with the thickened outwardly-projecting portion B, the lower part of said portion being provided with the recess C and the upper part with the outwardly-overhanging hook-shaped lugs D separated by the notch *D'*; and the bifurcated lifter E comprising the arm E' extending at its ends into the neck H formed with the wings or T-shaped end H', and the lower arm F, F'', the outer end of said lower arm being adapted to fit into the recess C, the said T-shaped end or wings being adapted to fit under said lugs, and the said neck being adapted to extend into the notch *D'* between the lugs, substantially as described.

608,858. EXCAVATING-TOOL. HARMON RAKOV, Buffalo, N. Y. Filed Dec. 30, 1897. Serial No. 664,794. (No model.)



Claim.—An excavating-tool consisting of a box or receptacle mounted in an open frame, carrying an elongated handle, hinged triangular box-bottom sections, provided with suspending devices, rigid arms pivoted to the suspending devices and to each other and provided with an attached cord or chain extending to the upper end of the tool-handle for closing the box-bottom sections, an angular frame pivoted to the open box-frame, one section of which is provided with shoulders for removable engagement with the suspending devices on the hinged box-bottom sections and the other section having an attached cord or chain extending to the upper end of the tool-handle for effecting the release of the hinged box-bottom sections and stops upon the box-frame for limiting the play of the hinged box-bottom sections and the pivoted engaging and releasing frame.

608,859. INCUBATOR. JOHN R. ROBERTS, Homer City, Pa. Filed Jan. 30, 1897. Serial No. 621,312. (No model.)

Claim.—1. In an incubator, the combination with the egg-chamber, cleats therein above its bottom, the egg-tray mounted directly thereon and smaller in one direction than the transverse distance across the chamber so as to leave a clear chick-space at one side of the tray from the space below to that above it, and the heating mechanism entirely out of contact with the tray; of glass-paneled doors in the front of the body opposite and above the tray, and sim-

ilar doors below it, the space within the body beneath the tray being adapted to serve as a brooder-chamber, as and for the purpose set forth.

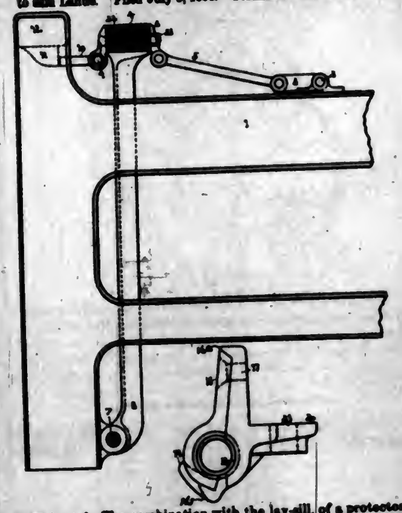
2. In an incubator, the combination with the heating-chamber having holes through top and bottom, and a source of heat; of an upright tube extending loosely through the lower hole and closely fitting the upper hole in the chamber and conveying heat internally from said source, and transversely-curved deflectors secured to the exterior of said tube at their upper ends and diverging outward therefrom toward their lower ends, their bodies having perforations near their upper extremities, as and for the purpose set forth.

3. In an incubator, the combination with a heating-chamber having holes through top and bottom, a plate covering one hole and itself having a central hole and surrounding perforations within the periphery of the hole in the chamber, and a source of heat; of an upright tube passing through the hole in the plate and through the remaining hole in the chamber, and deflectors secured at their upper ends to said tube with their lower ends diverging outward therefrom and perforations in their bodies, as and for the purpose set forth.

4. In an incubator, the combination with the heating-tube projecting to the exterior of the body; of pipes leading therefrom, a pair of outwardly-extending side flues connected with said pipes, an interposed return-flue connected with the outer ends of the side flues, all the flues standing against the body, an exit in the inner end of the return-flue, and a valve for adjustably restricting the size of said exit, as and for the purpose set forth.

5. In an incubator, the combination with the body having an egg-chamber and a heating-chamber, and means for leading the heat from the latter to the top of the former; of a perforate ventilator-tube extending along the bottom of the egg-chamber, an upright valved tube leading from one end thereof and opening near the top of the body, and another tube leading from the other end of the perforate tube through the heating-chamber upward and opening to the exterior of the body, as and for the purpose set forth.

6. In a thermostat, a body-strip of one metal attached at one end to a fixed support, narrow strips of another metal having a different coefficient of expansion secured upon opposite faces of said body in X shape, and a cross-strip attached to the free end of the body; combined with a heating-tube, a damper therefor, and connections between said cross-strip and damper, as and for the purpose set forth.



7. In a thermostat, a body-strip attached at one end to a support, a cross-strip of one metal secured to the other end of the body and bent upward in an elbow and thence outward in a horizontal finger, and narrow strips of another metal having a different coefficient of expansion secured upon one face of the body-strip, elbow, and finger along their edges; combined with a heating device, a damper therefor, and connections between the finger and damper, as and for the purpose set forth.

8. In a thermostat, a body-strip of one metal attached to a support, a cross-strip of the same metal secured to one end of the body and bent upward in an elbow and thence outward in a finger at right angles to the length of the body, and narrow strips of another metal having a different coefficient of expansion secured on opposite faces of the body in X shape and longitudinally along the outer face of the cross-strip, elbow, and finger; combined with a heat-regulating damper, and connections between said finger and damper, as and for the purpose set forth.

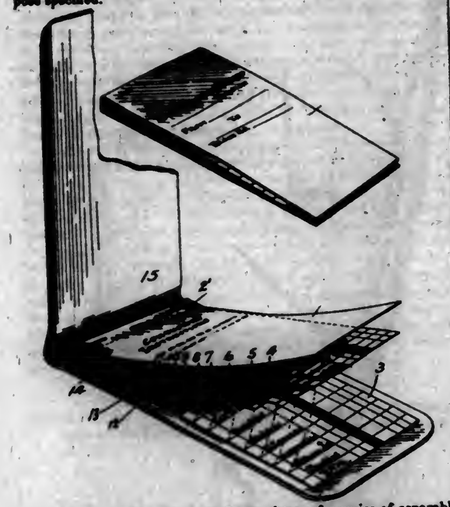
9. In an incubator, the combination with the egg-chamber, means for imparting heat to its top, and an egg-tray supported within the chamber between its top and bottom and having an opening at one side; of a thermal bar having one part below the tray and another part above it, and an interposed elbow passing through said opening, both said parts standing out of a vertical line through the opening so as to leave a clear chick-passage therethrough, and heat-regulating devices operated by said bar, as and for the purpose set forth.

10. In an incubator, the combination with the egg-chamber, means for imparting heat thereto, and an egg-tray within the chamber and having an opening at one side; of a thermal bar L-shaped in plan view, one arm extending from front to rear of the chamber beneath the tray, the other arm extending at right angles to the first and above the tray, and an interposed upright elbow extending through said opening and connecting the two arms, and heat-regulating devices operated by said bar, as and for the purpose set forth.

608,860. PROTECTOR STOP MECHANISM FOR LOOMS. CHARLES A. SAWYER and MOSES M. LABUR, Lowell, Mass.; said Sawyer assignor to said Labur. Filed July 9, 1896. Serial No. 598,535. (No model.)

Claim.—1. The combination with the lay-sill, of a protector-rod stand consisting of a bed formed with a socket to receive the protector-rod and with a lip 161 and offset 162, together with a cap formed with a socket to inclose the protector-rod, an edge engaging with the said lip and held in place thereby, and an opposite edge engaging said offset, and a screw securing said bed and cap together, and also holding the stand to the lay-sill, substantially as described.

2. The combination with the lay-sill, of a protector-rod stand consisting of a bed formed with a socket, with a channel 16, and with a retaining-lip 161 adjacent to the said channel, a bushing located in the said socket, a cap 15 having one edge thereof fitted into the said channel and engaged by the said retaining-lip, the said cap engaging with the bushing to hold the latter in place, and a screw securing said cap in place upon the stand, substantially as described.



3. A protector-rod stand consisting of a bed formed with two sockets with space for the dagger of the rod between them, bushings fitting said sockets, and caps clamping said bushings and means for securing said parts to said bed.

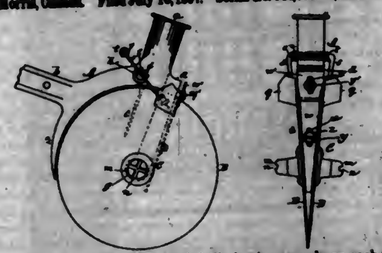
4. A protector-rod stand consisting of a bed formed with two separated sockets and with an intermediate portion constituting a backing for the dagger and protector-rod against thrusts received by the dagger, bushings fitting the said sockets, and means to secure said bushings in place in said sockets, substantially as described.

608,861. FARE REGISTER AND RECORD. GRANT D. HRAPP, St. Paul, and HENRY HAYS, Minneapolis, Minn.; said Hrapp assignor of his right and said Hays assignor of one-fourth of his right to Charles G. Hawley and Peter R. Gross, Minneapolis, Minn. Filed May 14, 1897. Serial No. 636,513. (No model.)

Claim.—1. The combination, in a fare register or record, of a record-sheet, with a series of register-sheets devoted each to a particular station, and arranged in regular order, each register-sheet bearing the names of the stations between its particular station and the terminus or last station, and said record-sheet having the names of the stations in order, and the same appearing beneath the lower edges of respective register-sheets as and for the purpose specified.

2. The combination, in a fare register and record, of a record-sheet bearing the names of all of the stations in order, with a series of sheets devoted to particular stations and of varying lengths in regular order, each register-sheet bearing the names of the stations between its particular station and the terminus or last station, and said sheets being divided into vertical columns, as and for the purpose specified.

3. The combination, in a fare-register, of a series of separable sheets of varying lengths, each devoted to a particular station and bearing the names of all stations between said particular station and the terminus or last station, and said sheets being divided into columns marked according to the kind of fares.



4. The combination, in a fare register and record, of record and register sheets, each having a heading substantially as described and divided into vertical columns marked with the names of the kinds of fare, said record-sheet bearing the names of all of the stations, said register-sheets being each devoted to a particular station and bearing the names of all the stations between said particular station and the terminus or last station named upon the record-sheet, and the names upon the record-sheet arranged to appear beneath the lower edges of register-sheets devoted to respective stations, substantially as described.

608,862. SEED-DRILL. WILLIAM SCRIVENER, Morris, Canada. Filed Mar. 26, 1896. Serial No. 584,467. (No model.)

Claim.—In a seed-drill, the combination of a grain-spout, revolving disks mounted upon the opposite sides thereof, and a tapered scraper adjustably mounted upon the grain-spout and between the disks, the said disks revolving in intersecting planes, whereby the adjustment of the scraper vertically regulates the bearing of the scraper on the inner faces of both of the said disks, substantially as described.

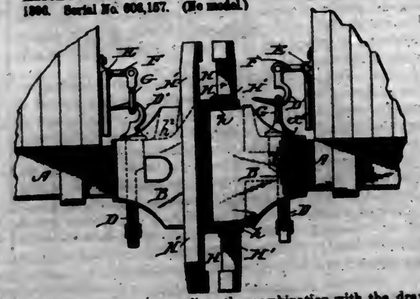
608,863. SEED-DRILL-DISK SHOE. WILLIAM SCRIVENER, Morris, Canada. Filed July 10, 1897. Serial No. 644,068. (No model.)

Claim.—1. A casting for seed-drills, having an axle on each side thereof, a grain-guide in front of the axles, and a shield in front of the guide, the whole being cast integral and being provided with a grain-spout between the axles and the grain-guide, substantially as described.

2. A casting for seed-drills, having a hollow axle on each side thereof, and a grain-guide and a draw-bar connection in front of the axles, and provided with a grain-spout in front of the axles and an oil-conduit, in the rear of the grain-spout, communicating with the central cavity of the axles, the said casting having lugs on the rear of the grain-spout, the whole being cast in one piece, substantially as described.

3. The combination, with a casting, having an axle on each side thereof, a draw-bar connection and a shield depending from the draw-bar connection, and provided with a grain-spout in front of the axles, the said parts being cast integral, of disks mounted upon the axles and behind the shield, substantially as described.

4. The combination with a casting having a hollow axle on each side thereof, and a grain-guide and a draw-bar connection in front of the axles and provided with a grain-spout in front of the axles and an oil-conduit, in the rear of the grain-spout, communicating with the central cavity of the axles, the said casting having lugs on the rear of the grain-spout, the whole being cast in one piece, of disks upon the axles, and a scraper adjustably secured between the disks upon the said lugs, substantially as described.



5. The combination with a casting, having a hollow axle on each side thereof and a draw-bar connection, a shield and a grain-guide in front of the axles, and provided with a grain-spout between the axles and grain guide, and with an oil-conduit in rear of the grain-guide, communicating with the cavity of the axles, and having lugs on the rear of the said oil-conduit, of disks mounted upon the said axles in the rear of the said shield, and a plurality of scrapers adjustably mounted in relation to each other and to the axles, upon the said lugs and between the disks, substantially as described.

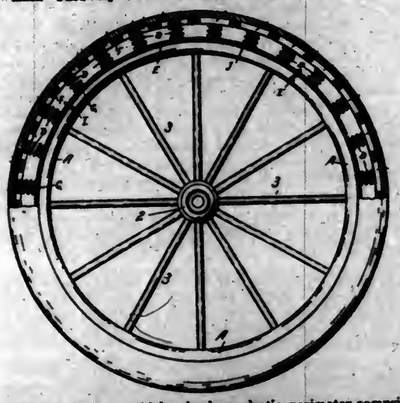
6. The combination with diverging axles, of disks mounted thereon, and having the inner sides of their edges beveled, and two scrapers, mounted between the disks and adjustable in relation to each other, the one scraper cleaning the plane surfaces of the disks and the other scraper cleaning the beveled surfaces thereof, substantially as described.

7. The combination with disks, of pivoted levers *a a*, scrapers *g g* pivoted to one end of the said levers, and a spring connecting the opposite ends of the said levers, whereby the scrapers are forced against the disks and accommodate themselves to the inclination thereof, substantially as described.

8. The combination with hollow axles, serving as an oil-reservoir, of disks provided with hubs, mounted upon the said axles, means for retaining the hubs in place, and screw-threaded caps upon the hubs forming auxiliary oil-chambers upon the exterior of the axles, the said auxiliary chambers being in communication with the said oil-reservoir in the interior of the axles, substantially as described.

608,864. COMBINED DRAW-HEAD, RIGGING, COUPLING, AND LATCH DEVICE. HAMILTON R. WELLS, Columbia, Pa. Filed Sept. 17, 1896. Serial No. 606,157. (No model.)

Claim.—1. In a car-coupling, the combination with the draw-head, its coupling device, and the latch-pin for said device, said pin having at its upper end a hook which is open at the back, of the operating shaft or lever having an eye designed to loosely engage the said hook, and hooks secured to the upper and lower portions of the said head and projecting inwardly over and below the same, substantially as and for the purpose specified.



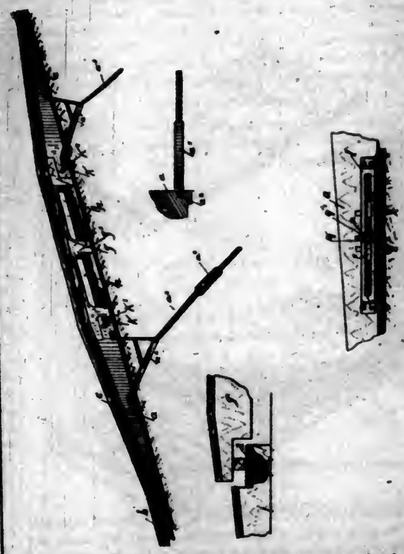
2. In a car-coupling of the class recited, the combination with the opposing draw-heads, their coupling-knuckles, the latch-pins for said knuckles, the operating devices for said pins, and means whereby said operating devices are automatically disengaged from the coupling-pins in the event of the draw-bar becoming detached from the car, of a device carried by each of said heads above and below the

same and adapted to engage the knuckles of the opposing head to support either draw-bar when detached from the car, substantially as specified.

3. In a car-coupling of the class recited, the combination with the draw-head, and its pivotal knuckle, of the latch-pin having the opening D^6 and the overhanging portion d^3, the auxiliary latch D^4 having the curved arm which engages loosely the opening D', said arm having the latch-head D^5 at its lower end and the detachable clevis-head D^4 at its upper end, and means for operating said auxiliary latch device to retract said latch-head when the pin is raised to release the coupling, substantially as specified.

4. In a car-coupling of the class recited, the combination with a draw-head and with a coupling-knuckle having the bearing d^4 for the latch-pin in its full coupled position, and the rearward projection C^3 having the beveled notch c^3, of the latch-pin having a reduced portion, and a beveled shoulder above said reduced portion and arranged to engage the notch c^3 and thereby temporarily lock the knuckle in partly-coupled position, substantially as specified.

603,865. VEHICLE-WHEEL. CHARLES G WHITAKER, Westfield, Mass. Filed July 9, 1897. Serial No. 643,945. (No model.)

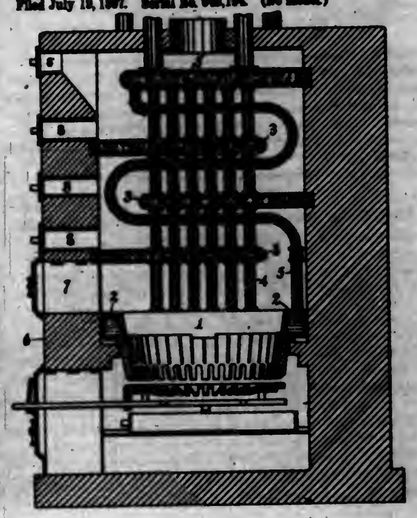


Claim.—1. In a vehicle-wheel, an elastic perimeter comprising a sectional rim, links and pins connecting said sections, coiled springs interposed between said rim-sections and the felly of the wheel, and a flexible tread enveloping said sections and springs, and by its borders engaging the said felly, substantially as described.

2. In a vehicle-wheel, an elastic perimeter comprising a series of rim-sections, each section having a spring-engaging base and depending borders on the opposite edges of said base, links and pins connecting said sections, a spring interposed between each of said rim-sections and the felly of the wheel, and a flexible tread enveloping said sections and springs, and by its borders engaging said felly, substantially as described.

3. In a vehicle-wheel, a felly therefor having spring-holding projections on its face and an elastic perimeter comprising a series of rim-sections, each section having a base and depending borders on the opposite edges of said base, and a spring-holding projection on said base, a spring interposed between each of said rim-sections and said felly and having said spring-holding projections entering the ends thereof, fibrous washers interposed between the ends of said springs and said perimeter and felly, connections between the adjoining ends of said sections consisting of links and pins, whereby one or more sections may move independently toward and from said felly, and a flexible tread enveloping said sections and springs, and by its borders engaging said felly, substantially as set forth.

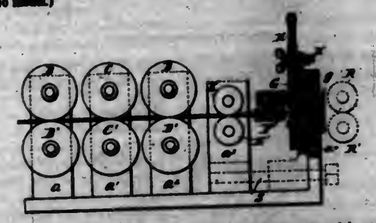
603,866. HOSE-BRIDGE. WILLIAM H. WOLF, Pittsburg, Pa. Filed June 11, 1897. Serial No. 640,314. (No model.)



Claim.—1. In a hose-bridge, the inclined end pieces provided with cut-away portions, a central section provided with openings on its lower face to receive the hose, said central section engaging in the cut-away portions formed in the inclined end pieces, a tongue engaging in a recess formed in said end pieces said end pieces and central section provided with a track throughout their length, braces engaging the end sections, and adjusting-rods connected to said braces to support the bridges on each rail, longitudinal slotted bars secured to the end pieces and provided with downwardly-projecting wedges, whereby said hose-bridge is secured to the track, said slotted bars permitting the longitudinal adjustment of the wedges, substantially as shown and described.

2. In a hose-bridge the inclined end pieces chamfered on the lower edge to conform to the shape of the rail, and provided on its inner end with a cut-away portion and having a recess formed therein, a central section provided on its underneath side with cut-away portions to receive the hose, the ends of said central section are provided with a cut-away portion adapted to fit the cut-away portion of the inclined ends, a tongue formed on the end of the central section, adapted to engage the recess in the end pieces, said end pieces and central section provided with a track throughout their length, braces engaging the end sections, and adjusting-rods connected to said braces to support the bridge on each rail, longitudinal slotted bars secured to the end pieces and provided with downwardly-projecting wedges, whereby said hose-bridge is secured to the track, said slotted bars permitting the longitudinal adjustment of the wedges, substantially as shown and described

---



603,867. WATER-HEATER. ARTHUR W. ACHARD, Saginaw, Mich. Filed July 19, 1897. Serial No. 645,194. (No model.)

Claim.—1. In a hot-water heater, the system of heating the water comprising the boiler, vertical pipes connected with the boiler and extending upward through the heating-chamber, a series of hollow partitions extending into the heating-chamber from opposite sides thereof and partly across the same, and connected to the vertical pipes extending from the boiler whereby the water will circulate through the boiler-pipes and partitions, and a series of coiled pipes connected to the boiler and extending upward zigzag through the heating-chamber between and around the ends of the partitions and terminating in the upper hollow partition, and the pipes 10 extending from the upper partition, substantially as described.

2. In a hot-water heater, the combination with the fire-pot, a heating-chamber above the fire-pot having extending into it two or more hollow horizontal partitions, the partitions extending from opposite sides and nearly across the chamber, whereby the heat will be deflected from one side of the chamber to the other through the flues between the partitions, a boiler surrounding the fire-pot, a series of vertical pipes extending upward from the boiler and connected to the hollow partitions whereby the water will circulate from the boiler through the pipes and partitions, and coiled pipes extending upward from the boiler around the inner ends of the partitions and through the spaces between the partitions, back and forth through the heated chamber to the top thereof and connected to the upper partition, and the discharge-pipes extending from the upper partition, and the return-pipes, substantially as specified.

603,868. WIRE STRAIGHTENING AND TWISTING MACHINE. JAMES ATKIN, Montclair, N. J. Filed Nov. 30, 1897. Serial No. 660,167. (No model.)

Claim.—1. A machine for twisting prismatic wire comprising two sets of rolls having their peripheries formed and arranged to present between them spaces which conform to the shape of the wire, and means for supporting and fixing said rolls so that said spaces have different angular positions in the two sets of rolls, so that as the wire passes from one set of rolls to the other it is twisted in conformity to said spaces.

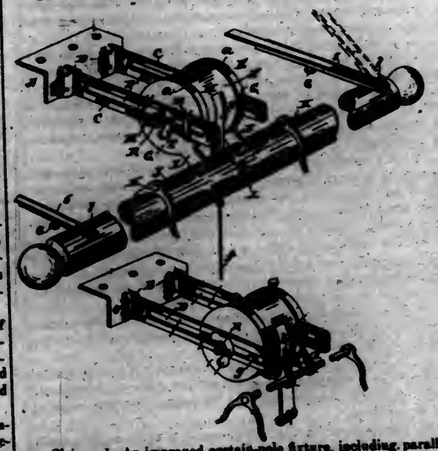
2. A wire-twisting machine comprising two sets of rolls conforming to the wire and arranged in line with one another so that the wire can pass through them in succession, means for varying the angular relation of one of said two sets of rolls, to the other, and means for clamping and fixing the two sets of rolls in definite angular relation.

3. A twisting-machine for prismatic wire comprising two sets of rolls, conforming to the wire and adapted to pass it successively between them, a fixed support for one of said sets of rolls, and a support for the other set of rolls which is angularly adjustable around the line of motion of the wire as a center, and means for fixing said support in any desired angular position.

4. A straightening and twisting machine, for prismatic wire, comprising three sets of rolls arranged in line so as to pass the wire successively between them and so straighten it, the peripheries of said rolls being formed and arranged to conform to the shape of the wire in different angular positions of same in the successive rolls and means for holding the said sets of rolls in such relative positions.

5. A straightening and twisting machine for prismatic wire comprising three sets of rolls arranged in line so as to pass the wire successively between them and so straighten it, the peripheries of each set of rolls conforming to the wire, and means for holding two of the sets in such angular relation that the peripheries of said sets conform to the wire in a different angular position of the wire so that the wire is twisted in passing from one to the other.

6. A machine for forming, straightening and twisting prismatic wires consisting of a series of forming-rolls having their peripheries formed to successively act on a round wire to change it to prismatic form, and two or more sets of twisting-rolls, one at least of which has its peripheries formed to conform to the prismatic wire in a different angular position to that which is given it by the forming rolls, so as to twist the wire, each sets of rolls being arranged in line, so as to straighten the wire and means for holding the said sets of rolls in such relative positions.



603,869. ROLLER-BEARING. WILLIAM F. RAHM, Springfield, Ohio, assignor to the Warder, Bushnell & Glessner Company, same place and Chicago, Ill. Filed Dec. 14, 1897. Serial No. 662,104. (No model.)

Claim.—1. In a roller-bearing, a cradle or bracket comprising end rings, and connecting-rods cast integrally therewith, one of said end rings provided with cylindrical seats and the other of said rings provided with seats having flared lips, in combination with rollers having one end adapted to be received endwise in the cylindrical seats in one of said rings and the other end adapted to be passed between said flared lips into the seat formed in the other of said rings, whereby, when said lips are hammered down said rollers are held in said cradle, as and for the purpose set forth.

2. In a roller-bearing, a cradle or basket comprising end rings and connecting-rods cast integrally therewith, one of said end rings provided on the inner face thereof with cylindrical seats, and the other of said rings provided on the inner face thereof with seats having flared lips, in combination with plane cylindrical rollers of a diameter greater than the radial thickness of said rings, one end of said rollers arranged to be received endwise in said cylindrical seat, and the other end arranged to be passed laterally between the flared lips of the corresponding seat in the other ring, whereby the peripheries of said rollers extend slightly beyond the inner and outer peripheries of said rings, said rollers being held in place by forcing said lips down and partially around the end of said rollers, as and for the purpose set forth.

603,870. CURTAIN-POLE BRACKET. JOSEPH BOLAND, Pittsburg, Pa., assignor to Charles H. Lloyd and Ella E. Boland, same place. Filed Oct. 20, 1897. Serial No. 655,844. (No model.)

Claim.—1. An improved curtain-pole fixture, including, parallel extending arms, a casing adjustable longitudinally therebetween, an extensible pole-containing device, a drum within the casing upon which the device is wound, and a bolt extending transversely through the casing and drum and forming a bearing for the latter, the bolt extremities engaging the arms and holding the casing in proper adjustment therebetween, substantially as shown and described.

2. An improved curtain-bracket, comprising an outwardly-extending support adapted to be secured centrally to the top of a window-frame, a vertically-extensible pole-supporting device sustained by the centrally-positioned support, and an elongated pole-embracing member extending transverse the support for holding the pole against vertical tilting when in raised position, substantially as shown and described.

3. A curtain-pole fixture comprising a supporting-arm, a cylinder longitudinally adjustable thereon, the cylinder provided with a transversely-elongated pole seat or socket, and a pole-supporting member carried by the said cylinder, at a point intermediate the ends of the elongated pole socket or seat, substantially as described.

4. A curtain-pole fixture comprising a supporting-arm, a cylinder

longitudinally adjustable thereon, the cylinder carrying a spring-actuated drum, a tape attached to the drum and extending through the cylinder, and a transversely-elongated pole seat or socket extending laterally beyond opposite sides of the said tape-opening, whereby the pole is held by the single bracket against tilting, substantially as and for the purpose described.

3. A curtain-pole fixture comprising a supporting-arm, a cylinder carrying a spring-actuated drum, a tape connected with the drum, the cylinder provided with an outwardly-extending arm or arms, and an elongated pole seat or socket carried by the arms, substantially as described.

6. A curtain-pole fixture comprising a supporting-arm, a cylinder adapted to be supported thereby, the cylinder provided with outwardly-extending arms, a rod carried by the arms and extending longitudinally of the cylinder, and pole-sockets carried by the said rod, substantially as described.

7. A curtain-pole fixture comprising parallel extending arms provided with longitudinal slots, a cylinder situated therebetween and provided with elements engaging the said brackets or arms to prevent the rotation of the cylinder in respect to the arms and a clamping means extending from the cylinder to the said slots, substantially as described.

8. A center curtain-pole bracket having an elongated pole-seat, and a supporting element attached to the pole and adapted to hold it in engagement with said seat at a point intermediate the ends of the pole, substantially as described.

9. In a curtain-bracket, a support including two longitudinally-slotted parallel arms, a cylinder between the arms provided with a tubular axial shaft, a clamping-rod extended through the tubular shaft and the arm-slots for making rigid the cylinder and arms and holding the former in desired adjustment, a spring-actuated drum on the tubular shaft within the cylinder, and a pole-sustaining tape wound upon the drum, substantially as shown and described.

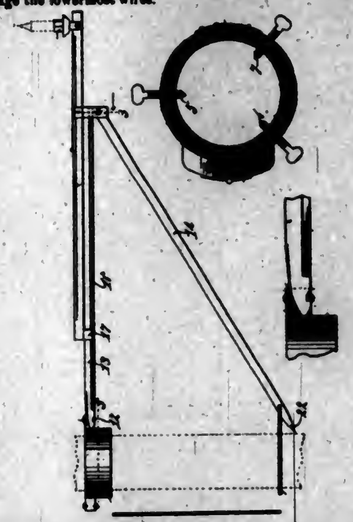
10. An improved curtain-bracket, including parallel supports, cylinder-heads mounted upon the supports, a cylinder-body rotatably secured between the heads and means for holding same in adjustment, the cylinder being provided with an opening, a spring-actuated drum within the cylinder, and a pole-sustaining extensible tape upon the drum and passing outward through the cylinder-opening, substantially as shown and described.

11. A curtain-pole fixture comprising a supporting bracket or arm, a cylinder, a spring-actuated drum within the cylinder, a shaft passing through the cylinder and supporting the drum, the said shaft engaging and adapted to clamp the said supporting-arm whereby it performs the double function of providing a clamp for the cylinder and the arm and a bearing or support for the spring-actuated drum, and a pole socket or seat, substantially as described.

12. In a curtain-pole fixture, a cylinder adapted to be supported upon an arm or bracket having its central portion movable independently of its end portions, the central portion carrying a pole socket or seat, and a clamping and releasing means for the independent parts of the cylinder whereby the pole-seat may be adjusted as described.

13. The combination with a curtain-pole, of an inwardly-extending arm pivotally connected to the outer face of the pole, whereby it is adapted to swing around in a plane outside of the plane of the outer face of the pole, substantially as described.

14. The combination with a curtain-pole, of an inwardly-extending arm adjustable longitudinal of itself and transverse the pole, substantially as described.



15. In a curtain-pole fixture, the combination of an adjustable pole-bracket, a pole supported thereby, and inwardly-extending horizontally-adjustable arms attached to the ends of the pole, substantially as described.

16. The combination with a curtain-pole, of an inwardly-extending laterally-swinging and longitudinally-adjustable arm attached to the pole, substantially as described.

608,871. CANDLE-HOLDER. FREDERICK J. DUBLIN, Friedheim, Ind. Filed Aug. 3, 1896. Serial No. 601,672. (No model.)

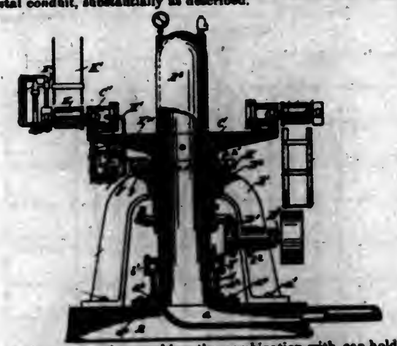
Claim.—1. In a device of the kind specified, a ring composed of sections hinged together and adapted to be locked by a spring-catch, devices for securing said ring around the trunk of a tree, projections adjacent the upper edge of said ring, wires secured to the outer ends of the upper and lower edges of said projections, and arms provided at their inner ends with devices adapted to engage said wires and having pivotal braces adapted to engage the trunk of the tree.

2. In a device of the kind specified, a ring composed of hinged sections adapted to be secured around the trunk of a tree, projections on said ring-sections, wires mounted upon the upper and lower faces of said projections and passing over recesses between the same, and arms adapted to be secured at their ends in said recesses and provided on their upper faces with bent springs adapted to engage the uppermost wires and on their lower faces with notches adapted to engage the lowermost wires.

608,872. CIGARETTE-BOX. JOHN R. BUCKLE, Washington, D. C., assignor to Arthur C. Moses, same place. Filed Feb. 15, 1898. Serial No. 670,400. (No model.)

Claim.—A closure, consisting of two sections, each complete in itself and adapted to contain the articles, the side pieces of one section adapted to overlap the side pieces of the other section when brought together, and a wrapper passing completely around said sections and pasted or otherwise secured thereto, said wrapper forming a connecting-hinge for the two sections at their bottoms and extended into a closing-flap for the same at their tops, substantially as set forth.

608,873. FOLDING BASKET. SARAH O. BURKEFIELD, Pittsburg, Pa. Filed Nov. 24, 1896. Serial No. 613,040. (No model.)

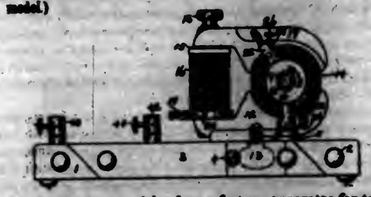


Claim.—In a folding basket, side and end pieces hinged together; a base formed in two pieces hinged together, said base being hinged to the rear side piece, hasps carried by said base, said hasps engaging staples secured in the front side, a securing-rod having a swiveled dart in one end and fastened to the front piece by a spring at the other and a detachable handle secured to the front and rear side pieces, substantially as shown and described.

608,874. TESTING APPARATUS. LOUIS C. CHESNEY, San Francisco, Cal. Filed June 5, 1895. Serial No. 551,202. (No model.)

Claim.—1. In a can-testing machine, the combination with means for clamping the can in place, an air-supply to the interior of the can, an indicating device, a connection between the air-supply and indicating device, and a separate connection between the indicating device and interior of the can, substantially as described.

2. In a can-testing machine, the combination with can-holding means, a source of air-supply, a pipe leading therefrom and discharging into the can, a supplemental conduit communicating with the air-supply and the said pipe in advance of the discharge end thereof, and an indicator controlled by the air-pressure through the supplemental conduit, substantially as described.



3. In a can-testing machine, the combination with can-holding mechanism, of an air-conductor arranged to communicate with the interior of the can, an indicator communicating with the conductor and actuated by the air passing therethrough during its passage to the can, and an air-supply from which the conductor leads, substantially as described.

4. In a dry testing apparatus, the combination with the vessel-clamping mechanism, of the air-cylinder, a piston working in said cylinder, a piston-rod connecting said piston with one of the clamping-heads, connection between the air-cylinder and a source of air-supply for conveying air within the air-cylinder so as to force the piston outward in order to cause the clamp-head operated thereby to clamp the vessel, devices for breaking the air-pressure within the cylinder, and of the spring located within the air-cylinder which forces the piston inward to release the clamped vessel the moment the air-pressure is released, substantially as described.

5. In a testing apparatus, the combination with the vessel-clamping and air-filling mechanism for the vessels, of the valve-box divided into an air-inlet and an air-outlet chamber, connection between the said clamping and filling mechanism and the air inlet and outlet chambers, an indicator communicating with the filling and the air inlet and outlet chambers, the slide-valves controlling the ports of the air inlet and outlet chambers, and of devices for operating said slide-valves to open and close the said ports, substantially as described.

608,875. ELECTRICAL APPARATUS FOR SCHOOLS. MELVIN H. CROWELL, Indianapolis, Ind., assignor to the Crowell Apparatus Company, same place. Filed Nov. 23, 1896. Serial No. 613,054. (No model.)

Claim.—1. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, an armature-shaft mounted in such pillow-block and sleeve, a driving-pulley mounted on such shaft, an armature adapted to be removably mounted on such shaft, a lower pole-piece with a pair of posts extending therefrom, a pair of coils that fit over such posts and have suitable binding-screws, an upper pole-piece detachably secured to the said posts on the lower pole-piece, a commutator, commutator-brushes removably mounted on the pillow-block sleeve, an L-shaped bar with one end secured to a sleeve adapted to be carried loosely on the armature-shaft and having a key at its free end and a binding-screw at its other end, a clamping-collar adapted to be mounted on the pillow-block sleeve, a spiral spring surrounding the sleeve to which the L-shaped bar is attached and secured at one end to such collar and at the other end to the bar, an armature secured to the bar over the poles of the magnet, a bell mounted on the base-plate, and a hammer removably secured to the free end of the bar and extending into close proximity with the bell, whereby a telegraph-sounder or electric bell may be made as desired.

2. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, an armature-shaft mounted in such pillow-block sleeve, a driving-pulley mounted on such shaft, an armature adapted to be removably mounted on such shaft, a lower pole-piece with a pair of posts extending therefrom, a pair of coils that fit over such posts and have suitable binding-screws, an upper pole-piece detachably secured to the said posts on the lower pole-piece, a commutator, commutator-brushes removably mounted on the pillow-block sleeve, an L-shaped bar with one end secured to a sleeve adapted to be carried loosely on the armature-shaft and having a key at its free end and a binding-screw at its other end, a clamping-collar adapted to be mounted on the pillow-block sleeve, a spiral spring surrounding the sleeve to which the L-shaped bar is attached and secured at one end to such collar and at the other end to the bar, an armature secured to the bar over the poles on the lower pole-piece, a post mounted in the base-plate having two parallel arms one above and one below such L-shaped bar with a set-screw in the upper one, a bell mounted in the base-plate, and a hammer detachably secured to the free end of such L-shaped bar and extending in close proximity with the bell, whereby a dynamo, telegraph-sounder or electric bell may be made as desired.

3. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, a shaft mounted in such block and sleeve, an electric magnet mounted on the base-plate and having suitable binding-screws, a post mounted in the base-plate having two parallel arms with a set-screw in the upper one and the lower one insulated, a bar secured at one end to a sleeve that is loosely carried on the shaft having a key at its free end and a binding-screw at the other end, a clamp-collar mounted on the pillow-block sleeve, a spiral spring surrounding the sleeve to which the bar is secured with one end attached to such collar and the other end to the bar, an armature secured to the bar over the poles of the magnet, a bell mounted on the base-plate, and a hammer removably secured to the free end of the bar and extending into close proximity with the bell, whereby a telegraph-sounder or an electric bell may be made as desired.

4. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, an armature-shaft removably mounted on such pillow-block, an armature adapted to be mounted on such shaft, a lower pole-piece with a pair of posts extending therefrom, a pair of coils removably mounted on such posts and having suitable binding-screws, an upper pole-piece detachably secured to the posts on the lower pole-piece, a commutator, commutator-brushes removably mounted on the pillow-block sleeve, a spool adapted to be secured to the base-plate having a secondary coil wound thereon and with an opening longitudinally through it large enough to admit the coils 16, a core adapted to extend through such coils, a post secured to the base-plate having an arm extending therefrom and provided with a regulating set-screw, and a circuit-breaker connected to such arm and extending into close proximity with the end of the core, whereby a dynamo or induction-coil may be made as desired.

5. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, a shaft removably mounted in such block and sleeve, an electric magnet mounted on the base-plate with removable coils and having suitable binding-screws thereon, a bar secured at one end to a sleeve that is loosely carried on the shaft having a key at the free end and a binding-screw at the other end, a clamp-collar mounted on the pillow-block sleeve, a spiral spring surrounding the sleeve to which the bar is secured with one end attached to the collar and the other end to the bar, an armature secured to the bar over the poles of the magnet, a post mounted in the base-plate having two parallel arms with a set-screw in the upper one and the lower one insulated, a spool adapted to be secured to the base-plate having a secondary coil wound thereon and with an opening longitudinally through it large enough to admit the coils of an electromagnet, a core adapted to extend through such coils, a circuit-breaker connected to the insulated arm of such post and extending into close proximity with the end of the core, and a screw extending through such post to regulate the circuit-breaker, whereby a telegraph-sounder or induction-coil may be made.

6. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, a shaft removably mounted in such pillow-block and sleeve, an electromagnet mounted on the base-plate with removable coils and having suitable binding-screws thereon, a bar secured at one end to a sleeve that is loosely carried on the shaft having a key at the free end and a binding-screw at the other end, a clamp-collar mounted on the pillow-block sleeve, a spiral spring surrounding the sleeve to which the bar is secured with one end secured to such collar and the other end to the bar, an armature secured to the bar over the poles of the magnet, a post mounted in the base-plate hav-

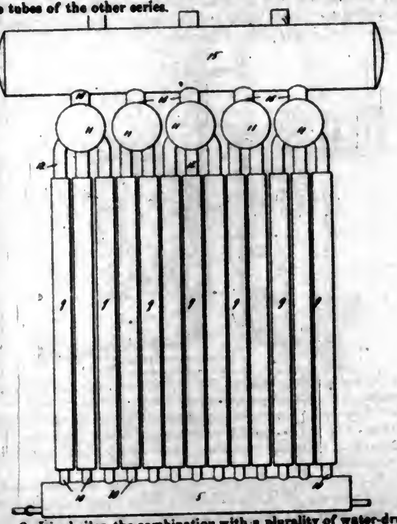
ing two parallel arms with a set-screw in the upper one and the lower one insulated, a spool adapted to be secured to the base-plate having a secondary coil wound thereon and with an opening longitudinally through it large enough to admit the coils of the electromagnet, a core adapted to extend through such coils, a circuit-breaker connected to the arm on such post and extending into close proximity with the end of the core, a screw extending through such post to regulate the circuit-breaker, and a bell mounted on the base-plate where the circuit-breaker when mounted on the free end of the telegraph-sounder bar will engage such bell, whereby the telegraph-sounder, electric bell or induction-coil may be made as desired.

7. As an article of manufacture, apparatus for teaching electricity comprising a base-plate, a pillow-block with a sleeve extending therefrom, an armature-shaft removably mounted in such pillow-block and sleeve, a driving-pulley mounted on such shaft, a lower pole-piece removably secured to the base-plate with a pair of posts extending therefrom, a pair of coils mounted on such posts and having suitable binding-screws, an upper pole-piece detachably secured to the said posts on the lower pole-piece, a commutator, commutator-brushes removably mounted on the pillow-block sleeve, an L-shaped bar with one end secured to a sleeve adapted to be carried loosely on the armature-shaft and having a key on its free end and a binding-screw at its other end, a clamping-collar adapted to be mounted on the pillow-block sleeve, a spiral spring surrounding the sleeve to which the L-shaped bar is attached and secured at one end to said collar and at the other end to the bar, an armature secured to the bar over the posts on the lower pole-piece, a post mounted in the base-plate, a spring-plate detachably secured to the free end of such L-shaped bar and extending in close proximity with the bell, a spool adapted to be secured to the base-plate having a secondary coil wound thereon and with an opening through it large enough to admit the coils 16, a core adapted to extend through such coils to a point next said post, and a set-screw extending through said post for regulating the circuit-breaker, whereby a dynamo, telegraph-sounder, electric bell or induction-coil may be made as desired.

8. In a dynamo, the combination of an armature provided with a central tubular extension, a bracket secured on such extension with a hole and binding-screw near its free end for each coil in the armature, and a commutator that slips on said tube and is provided with pins to connect it up with said bracket by means of the binding-screws.

9. In apparatus for teaching electricity, a base-plate, a bar pivoted between its ends to the base-plate at one side thereof, legs or extensions extending from said side of the base-plate of the same thickness as said bar, whereby when the bar is turned at right angles to the base-plate, it together with the legs or extensions on the base-plate will support the base-plate in a vertical position.

608,876. ELECTRIC HEADLIGHT. FREDERICK W. DRESSEL, New York, N. Y. Filed Oct. 6, 1897. Serial No. 654,209. (No model.)



Claim.—1. An electric headlight, in which are comprised a flanged ring for securing within a car-dash, said ring carrying the lamp-bracket and lamp; a glass secured within said ring, and the body of the headlight hinged to the fixed ring and arranged to swing inward, substantially as shown and described.

2. In a headlight of the character herein specified, a ring secured within a car-dash, said ring being wider at the bottom than at the top, in combination with the body of the headlight hinged to said ring, substantially as shown and described.

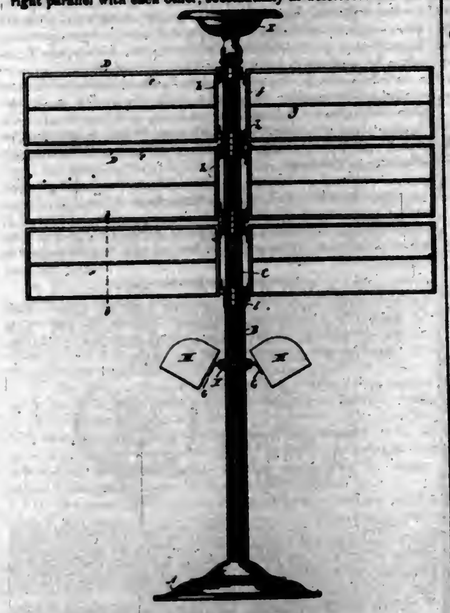
3. In a headlight of the character herein specified, a ring secured within a car-dash, said ring being wider at the bottom than at the top, and having a rabbet at its inner edge, in combination with the body of the headlight hinged to the fixed ring, arranged to lap thereover and be held in place, substantially as shown and described.

608,877. BOILER. FRED A. GARDINER, Dedham, Mass. Filed Dec. 31, 1897. Serial No. 665,075. (No model.)

Claim.—1. In a boiler, the combination with a plurality of water-drums of a series of vertical columns connected with each drum in a common plane, a plurality of separating-drums arranged above and transversely of the said columns and water-drums, the columns of each series being connected alternately in pairs and trios with the adjacent ends of their respective separating-drums, the middle column of each trio having vertical connection with the lowest point of the drum to drain the latter, the remaining columns of each trio having bent connections with the sides of their respective drums, the columns of each pair having vertical connection with the adjacent ends of their respective drums, a plurality of angular tubes extending outwardly from each column and upwardly in the plane of its column, the tubes from the columns of one series extending between the tubes of the other series.

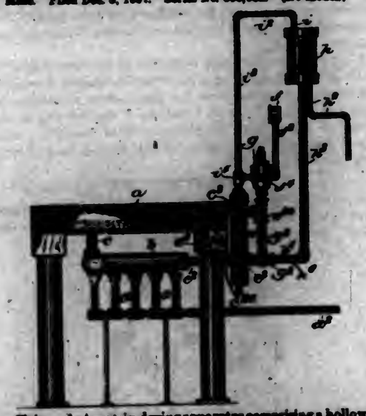
2. In a boiler, the combination with a plurality of water-drums, of a series of columns connected with each drum, a plurality of separating-drums arranged above and transversely of the water-drums, the columns of each series being connected alternately in pairs and trios with their respective separating-drums, a series of water-tubes extending from each column and connected with the separating-drum of its respective column, and a steam-drum connected with the separating-drums.

3. In a boiler, the combination with a plurality of water-drums, of a series of water-columns connected with each drum, a plurality of separating-drums arranged above and transversely of the water-drums, the columns of each series being connected in pairs and trips with their respective separating-drums, each separating-drum having a trio of one series connected with one end thereof and a pair of the opposite series connected with the other end, a series of tubes leading from each column to the separating-drum to which said column is connected, and a steam-drum connected with the separating-drums.



4. In a boiler the combination with a plurality of water-drums, of a series of water-columns connected with each drum, a plurality of separating-drums arranged above and transversely of the water-drums, the columns of each series being connected in groups with their respective separating-drums, said groups being alternately equal and successively different in number, each separating-drum having a larger group of one series connected with one end and a smaller group of the other series connected with the other end thereof and a series of tubes leading from each column and connected with the separating-drum with which its column is connected.

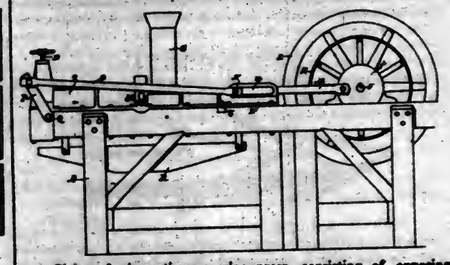
5. In a boiler the combination with a plurality of water-drums, of a plurality of separating-drums, water-columns connected with each water-drum and connected in groups with the separating-drums, water-tubes leading from the columns to the separating-drums with which their respective columns are connected, and a steam-drum connected with the separating-drums.



6. In a boiler, the combination with a plurality of water-drums, of a plurality of separating-drums, a series of water-columns connected with each water-drum and connected in groups with the separating-drums, said groups being alternately equal and successively different in number, each drum having a larger group of one series connected with one end and a smaller group of the other series with the other end thereof, water tubes leading from the columns and connected with the separating-drums with which their respective columns are connected, and a steam-drum connected with the separating-drums.

608,878. PHOTOGRAPH-HOLDER. LOUIS B. HERMAN, New Haven, Conn. Filed June 21, 1897. Serial No. 641,587. (No model.)

Claim.—In a photograph-holder the combination with a base, an upright post arranged thereon and having an annular shoulder, of rings on the upper portion of said upright and each formed with outwardly-extending internally-threaded lugs and a plurality of frames, each comprising two sides connected by a lower bar having parallel longitudinal grooves in its upper edge and two upper bars parallel with each other and with the lower bar, two arms fixed to the inner side members of each of the frames and formed with offset screw-threaded fingers for engagement with the lugs on the said rings whereby the said frames are pivotally mounted on the said upright parallel with each other, substantially as described.



608,879. MATRIX-DRYING APPARATUS. BENJAMIN F. JACKSON, Cambridge, Mass., assignor of three-fourths to Ada M. Child, Boston, Mass. Filed Dec 3, 1897. Serial No. 660,682. (No model.)

Claim.—1. A matrix-drying apparatus comprising a hollow steam-tight table having a flat top to receive the matrix; a steam-generator of substantially less capacity than that of said table; one or more connecting-ducts for said generator and table; a burner or burners arranged to deliver heat against the walls of said generator; a closed water-supply reservoir above the table; and means for equalizing the pressure in said reservoir and said table to permit water to flow by gravity from said reservoir to said table; all of the said parts being arranged to form a complete self-contained apparatus; substantially as and for the purpose described.

2. The herein-described matrix-drying apparatus which comprises the table *a*, the generator *b* consisting of a single casting mounted below said table, the pipes *c* leading from said generator into said table through the bottom thereof, the water-supply reservoir *A* having a passage leading from the top thereof to the top of the steam-table, and a passage from the bottom thereof leading to the generator, and the water-gage, pressure-gage, and safety-valve arranged in said pipe system, substantially as and for the purpose described.

608,880. CONTINUOUS WINE-PRESS. CHARLES K. KIRBY, San Francisco, Cal. Filed Sept. 14, 1897. Serial No. 651,622. (No model.)

Claim.—1. A continuous wine-press, consisting of opposing pressor-plates or jaws with positive means for effecting their approach and separation to alternately press and relieve the layer of grapes lying in the space between them, a supply device to present the grapes in line with the rear end of said space, and a reciprocating plunger or feed-plate adapted to force the grapes, in successive charges, into the rear end of said space, whereby a section of the pressed layer is successively discharged from the front end thereof.

2. A continuous wine-press consisting of opposing pressor-plates or jaws, adapted to receive the grapes in the space between them, a supply device to present the grapes in line with the rear end of said space, a reciprocating plunger, adapted to force the grapes, in successive charges, into the rear end of said space, and a positive means for effecting the approach and separation of said jaws substantially synchronously with the withdrawal and feed, respectively of the plunger, whereby the layer of grapes between the jaws is alternately pressed and relieved, and sections thereof discharged from the front end, as successive charges are fed to the rear end.

3. A continuous wine-press, consisting of opposing pressor-plates or jaws, one of which is adapted to move or swing toward and from the other, to alternately press and relieve the grapes lying in the space between them, a supply device to present the grapes in line with the rear end of said space, a reciprocating plunger, adapted to force the grapes, in successive charges, into the rear end of said space, and a positive mechanism for directly swinging the movable pressor-plate or jaw and reciprocating the plunger, in such time, that as the jaw presses the layer of grapes, the plunger is withdrawn for a fresh charge, and as the jaw relieves the layer, the plunger advances and forces the fresh charge into the rear end of the space between the jaws thereby advancing the whole layer and discharging a portion from the front end of the space.

4. A continuous wine-press, consisting of an upper fixed jaw or pressor-plate, an opposing lower swinging jaw or pressor-plate, apertured, to permit the flow through it of the expressed must, a hopper back of the fixed jaw and a fixed grating below the hopper and back of the swinging jaw, said hopper and grating forming a means for presenting the grapes in line with the rear end of the space between the jaws, and a reciprocating plunger or feed-plate operating between the hopper and grating and adapted to force the grapes lying in the plane of its movement into said space, whereby they are continuously pressed and discharged from the front end thereof, as successive charges are fed to the rear end.

5. A continuous wine-press consisting of a fixed jaw or pressor-plate, an opposing swinging jaw or pressor-plate, a supply device comprising a hopper and underlying support, adapted to present the grapes in line with the rear end of the space between the jaws, a reciprocating plunger or feed-plate, adapted to force the grapes in successive charges into said space, and a hinge connection for the swinging jaw, passing below and swung from a pivotal center back of said supply device.

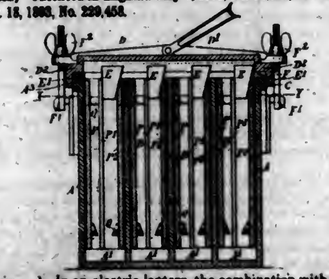
6. A continuous wine-press, consisting of opposing pressor-plates or jaws, means for swinging one of said jaws, to press the grapes in the space between them, means for adjusting the other jaw, to regulate the depth or thickness of said space, a supply device to present the grapes in line with the rear end of said space, and a reciprocating plunger or feed-plate, adapted to force the grapes, in successive charges, into the rear end of said space, whereby they are continuously pressed and discharged from the front end thereof, as successive charges are fed to the rear end.

7. A continuous wine-press, consisting of opposing presser-plates or jaws, relatively movable and adjustable, to press and to relieve the grapes lying in the space between them and to regulate the depth of said space, a supply device to present the grapes in line with the rear end of said space, a reciprocating plunger adapted to force the grapes, in successive charges, into the rear end of said space, whereby they are continuously pressed and discharged from the front end thereof, as successive charges are fed to the rear end, and means for operating the movable jaw and the plunger, comprising a cross-head actuated from a driving-shaft, a rock-shaft with cams under the jaw, and connections from the rock-shaft to the sliding cross-head, and connections from said cross-head to the plunger.

603,881. CHIMNEY-COWL. OTTO KUPRAI, New York, N. Y. Filed Feb. 20, 1897. Serial No. 625,115. (No model.)

Claim.—1. A chimney-cowl formed of a plurality of hollow cones arranged with the vertex of each cone except the top one extending into the cone above it, said cones having openings near their vertexes, substantially as described.

2. A chimney-cowl formed of a plurality of hollow cones arranged with the axes of alternate cones set obliquely in opposite directions and with the vertex of each cone except the top one extending into the cone above it, and said cones having openings near their vertexes in the sides nearest parallel with the general axis of the series, substantially as described.



3. A chimney-cowl formed of three hollow cones arranged with the axes of alternate cones set obliquely in opposite directions and with the vertex of each cone except the top one extending into the cone above it, and said cones having openings near their vertexes in the sides nearest parallel with the general axis of the series, substantially as described.

4. A chimney-cowl formed of a plurality of hollow cones arranged with the axes of alternate cones set obliquely in opposite directions and with the vertex of each cone except the top one extending into the cone above it, and said cones except the top one, having openings near their vertexes in the sides nearest parallel with the general axis of the series, said top cone having its vertex cut off in a horizontal plane, substantially as described.

5. A chimney-cowl formed of a plurality of hollow cones arranged with the axes of alternate cones set obliquely in opposite directions and with the vertex of each cone except the top one extending into the cone above it, and said cones having openings near their vertexes, the openings in one or more of the cones being in the sides of the cones nearest parallel with the general axis of the series, substantially as described.

6. A chimney-cowl formed of a plurality of hollow oblique cones arranged with their bases parallel and their axes extending alternately in opposite directions and with the vertex of each cone except the top one extending into the cone above it, and said cones having openings near their vertexes, the openings in one or more of the cones being in the sides nearest parallel with the general axis of the series, substantially as described.

603,882. ELECTRIC LANTERN. FREDERICK G. W. J. ADAMS, London, England. Filed Apr. 24, 1897. Serial No. 633,684. (No model.) Patented in England July 7, 1891, No. 11,536, and in France Apr. 18, 1893, No. 229,458.

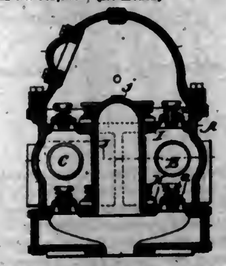
Claim.—1. In an electric lantern, the combination with a casing A having partitions B, of blocks A' A^2 at the bottom of the casing electrodes with insulating-stops, wedges E for securing the electrodes, overlapping cover D provided with metal strap D', contact-pegs O, conductors and sliding front G covering the conductors and carrying the lamp and fittings substantially as set forth.

2. In an electric lantern a battery consisting of the casing A having partitions B, blocks A', A^2 at the bottom and rim A^3 all integral therewith, two electrodes in each cell of which the negative consists of two members, one negative member being fixed, while the other and the positive electrode are held in position by wedges, overlapping cover D provided with metal strap, D', contact-pegs O and means for securing the cover, substantially as described.

3. In an electric lantern a battery-casing consisting of the case A having integral therewith partitions B blocks A', A^2 at the bottom rim A^3 and grooves H in front, for receiving a sliding plate G overlapping cover D provided with metal strap D' with longitudinal recess B', means for securing the cover to the case and a handle, substantially as described.

4. In an electric lantern the combination with a casing A having ridges H' and grooves H of a sliding front G, base-piece L attached to the sliding front and provided at its center with piece L' of insulating material, the conductors L^2 passing through said piece L', an electric lamp M, a reflector M^2 and lens N, substantially as described.

603,883. SAFETY INCANDESCENT ELECTRIC LAMP. FREDERICK G. W. J. ADAMS, London, England. Filed May 10, 1897. Serial No. 635,799. (No model.) Patented in England July 7, 1891, No. 11,536, and in France Apr. 18, 1893, No. 229,458.



Claim.—1. An electric safety-lamp consisting of the lamp proper which is provided with a glass chamber inclosing the lamp and joined thereto by the fusion of the glass and an automatic circuit-breaker becoming active upon breakage of the inclosing chamber, substantially as described.

2. An electric safety-lamp consisting of the lamp proper which is provided with an inclosing glass chamber integral therewith and joined thereto by the fusion of the glass, a lamp-support forming two chambers one of which communicates with the chamber formed by the lamp-inclosing glass envelop, two conductors, one passing through the glass envelop uninterruptedly into the lamp, the other passing through the support being formed of two parts and forming the circuit-breaker, as specified.

3. An electric safety-lamp consisting of the lamp proper which is provided with an inclosing glass chamber integral therewith and joined thereto by the fusion of the glass and an automatic circuit-breaker becoming active upon breakage of the inclosing envelop in combination with a parabolic lens having faces coming to a common apex and provided with a holder or shield formed integral with the lens, as specified.

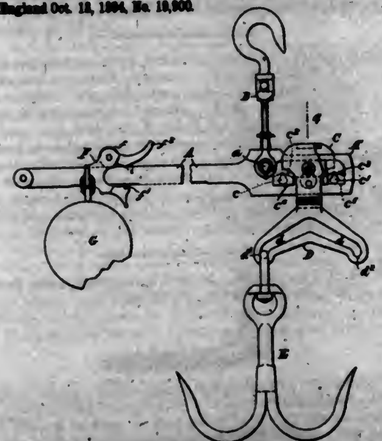
603,884. PUMP. LOUIS D'AURIA, Philadelphia, Pa., assignor to the d'Auria Pumping Engine Company, Camden, N. J. Filed Apr. 17, 1897. Serial No. 632,578. (No model.)

Claim.—1. The herein-described improvement in pumps, consisting in the combination with the suction-chamber, of a relieving chamber located within the liquid end of the pump, substantially in line with the general direction of flow of the incoming liquid from the suction-pipe, said chamber having its inlet substantially in the same plane with the openings to the suction-valves, substantially as and for the purpose set forth.

---

2. The herein-described improvement in pumps, consisting in the combination with the suction-chamber, of a relieving-chamber located within the liquid end of the pump, substantially in line with the general direction of flow of the incoming liquid from the suction-pipe and formed integral with the pump-body, the inlet to the said chamber being in substantially the same plane as the openings to the suction-valve, substantially as and for the purpose set forth.

3. The herein-described improvement in duplex pumps, consisting in the combination with the suction-chambers, of a relieving-chamber located centrally between the pump chambers, and having an inlet opening substantially in line with the general direction of flow of the incoming liquid from the suction-pipe, and located substantially in the same plane as the openings to the suction-valves, substantially as and for the purposes set forth.



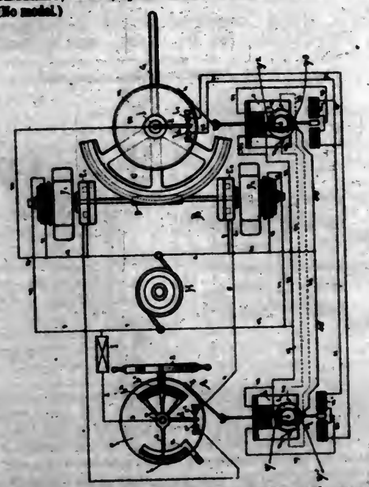
4. The herein described improvement in duplex pumps, consisting in the combination with the suction-chambers of the pump, of a relieving-chamber located centrally within the liquid end of the pump between the pump-chambers and substantially in line with the general direction of flow of incoming liquid from the suction-pipe, the inlet to said chamber being located substantially in the same plane as the openings to the suction-valves, substantially as and for the purpose set forth.

5. The herein-described improvement in duplex pumps, consisting in the combination with the suction-chamber, of a relieving-chamber formed integral with the liquid end of the pump and located centrally therein between the pump-chambers, the inlet to said chamber being located substantially in the same plane with the openings to the suction-valves, substantially as and for the purposes set forth.

6. The herein-described improvement in duplex pumps, consisting in the combination with the suction-chamber and the valve-decks, of a relieving-chamber located centrally within the suction-chamber, with webs integrally uniting the said relieving-chamber with the valve-decks and pump-body, the inlet to said chamber being located substantially in the same plane with the openings to the suction-valves, substantially as and for the purposes set forth.

7. In a pump, the combination with the suction-chamber and the suction and discharge valve decks thereof, of a relieving-chamber located substantially in line with the general direction of flow of the incoming liquid from the suction-pipe, having its inlet substantially in the same plane with the openings to the suction-valves, and formed integral with the pump-body, and a cored discharge-passage in the pump-body opening in the discharge-valve deck, substantially as described.

603,885. STEELYARD. CHARLES H. RADELEFF, Bristol, England. Filed Dec. 22, 1897. Serial No. 663,013. (No model.) Patented in England Oct. 13, 1894, No. 19,900.



Claim.—1. The combination, with the short arm of a steelyard, of two sets of knife-edge centers at different distances from the center of suspension, and of a single hanger provided with two sets of bearings adapted to rest on either set of centers indifferently, and having a shifting connection with the load-suspension device whereby the load may be caused to bear through the hanger entirely upon the one or other set of centers, as and for the purpose specified.

2. The combination, with the short arm of a steelyard, of two sets of knife-edge centers at different distances from the center of suspension and of a single hanger provided with two sets of bearings adapted to rest on either set of centers indifferently, and provided with a rigid yoke or link adapted to permit of a shifting connection with the load-suspension shackle, the yoke or link extending beyond the knife-edge centers so as to cause the load-suspension hook, when at the one or other end of such link, to bear, through the hanger, entirely upon the one or other set of centers, substantially as and for the purpose specified.

3. The combination, with a steelyard having notches in its lower edge, of a carriage for the adjustable weight adapted to act as a lever having its fulcrum movable upon the upper edge of the steelyard and having a nib which is caused to engage with the notched lower edge by the gravity of the weight, substantially as and for the purpose specified.

4. The improved steelyard herein described, consisting of a steelyard provided with two sets of knife-edge bearings and a hanger self-adjusting thereon, as described, in combination with an adjustable weight-carriage adapted to engage with the notched lower edge of the steelyard and provided with indexes referring to two scales upon the same face of the steelyard, as specified.

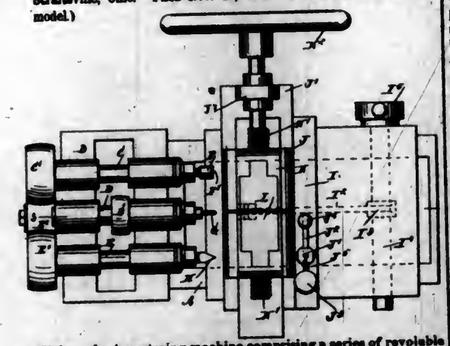
603,886. ELECTRICAL STEERING APPARATUS. HARRY O. F. BURNHAM, Madrid, Spain. Filed June 4, 1897. Serial No. 639,401. (No model.)

Claim.—1. The combination with the rudder, and motors rotating in opposite directions, of electromagnetic clutches for operatively connecting the rudder with either of said motors, a switch-arm under the control of the operator, movable contact devices adapted to cooperate with said switch-arm, electrical connections adapted to form a circuit from said switch-arm and contact devices to the electromagnetic clutches, a switch-arm constructed to move with the rudder, movable contact devices adapted to cooperate with said switch-arm, synchronously-operated motors arranged to move the contact devices of the controlling switch-arm and of the rudder switch-arm, and electrical connections adapted to form a circuit from the rudder switch-arm and either of its contact devices to the said synchronously-operated motors, substantially as described.

2. The combination with the rudder, motors rotating in opposite directions, and clutches for operatively connecting the rudder with either of said motors, of an axle or pivot adapted to be turned by the man at the wheel, a switch-arm capable of a limited rotary movement relatively to said pivot, and having an inclined surface, a pin projecting from the pivot and engaging said inclined surface, a spring for keeping the pin against the inclined surface, contact devices arranged to be engaged by the said switch-arm and electrically connected to the said clutches, and means for holding the rudder stationary after it has reached the desired position, substantially as described.

3. The combination with the rudder, motors rotating in opposite directions, clutches for operatively connecting the rudder with either of said motors, and an actuating device under the control of the operator, for operating one clutch or the other, of a switch-arm capable of a limited rotary movement relatively to the pivot of the rudder and having an inclined surface, a pin projecting from the the pivot and engaging said inclined surface, a spring for keeping the pin against the inclined surface, contact devices adapted to be engaged by said switch-arm, synchronously-operated motors in circuit with said contact devices and switch arms, and operative connections from

said motors to move the contact devices and to disconnect the rudder from the clutch-controlled motors, substantially as described.



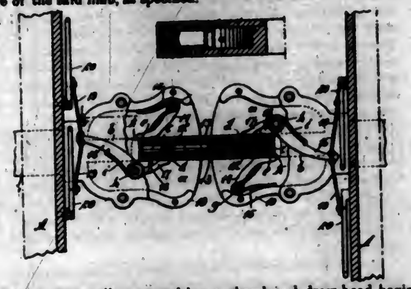
608,887. ROCK-DRILL SHARPENER. THOMAS H. BRADBURY, Johannesburg, South African Republic, assignor to the Bradbury's World Patent Drill Sharpener Company, Limited, London, England. Filed Dec. 16, 1895. Serial No. 572,236. (No model.) Patented in South African Republic Mar. 1, 1894, No. 612.

Claim.—In a drill-sharpening apparatus the combination with cutting and shaping dies, of the gaging-dies comprising the upper and lower dies having the grooves I formed with parallel sides and tapering with respect to each other on their upper and lower surfaces, for the purpose of centering and gaging the sharpened drill

---

608,888. CENTERING-MACHINE. JACOB H. BREWER, New Straitsville, Ohio. Filed Nov. 12, 1897. Serial No. 658,229. (No model.)

Claim.—1. A centering-machine comprising a series of revolvable spindles adapted to carry a squaring-tool, a drill, and a reamer arranged in the same plane, a carriage mounted to slide toward and from the said tools, a cross-slide movable on the said carriage at right angles to the movement thereof, a holding device on the said cross-slide, for holding the work in the same plane as the said tools, means for moving the carriage forward and backward, to carry the work to and from the tools, and means for adjusting the cross-slide, to carry the work successively in alinement with the said tools, and for locking the slide to the carriage after it has been adjusted, substantially as shown and described.



2. In a centering-machine, the combination with a tool-carrying head-stock, a carriage, and means for moving the carriage toward and from the head-stock, of a work-carrier sliding transversely on the carriage, and a lever engaging said carrier and carriage to move the said carrier and lock it to the carriage, substantially as described.

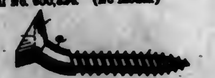
3. In a centering-machine, the combination with a head-stock carrying a plurality of tools, a carriage provided with a plurality of openings corresponding to the number of tools carried by the head-stock, and means for operating the carriage, of a work-carrier sliding transversely on the carriage and provided with an opening adapted to register with either of the openings of the carriage, and a pivoted lever provided with a pin at one end engaging the opening of the carrier and adapted to engage any one of the openings of the carriage, substantially as described.

4. A centering-machine, comprising a head-stock provided with a series of revolvable spindles carrying a squaring-tool, a drill, and a reamer, a carriage mounted to slide toward and from the tools and provided with openings corresponding in number to that of the tools, a slide mounted to slide transversely on the carriage and provided with an opening, a pivoted lever provided at one end with a pin entering the opening of the slide and adapted to enter any one of the openings of the carriage, a two-part chuck mounted on the slide and adapted to hold dies, and a right and left hand screw for operating the chuck, substantially as herein shown and described.

608,889. CAR-COUPLING. JAMES M BROWN and LEO D. PEAK, Exeter, Ill. Filed Aug. 26, 1897. Serial No. 649,458. (No model.)

Claim.—1. A car-coupling, comprising a chambered draw-head, an elongated coupling-link having a laterally-hooked outer end, and a twist at the side rearward of the hook, said link being pivoted near its rear end at the rear of the draw-head chamber, a limb pivoted at the side of the coupling-link and spring-pressed thereon opposite from the hook, and means to rock the link laterally against the pressure of the said limb, as specified.

2. A car-coupling, comprising a chambered draw-head having an abutment-wall extending forwardly therein, a spring-pressed limb pivoted in the draw-head at one side of the abutment-wall and normally pressing thereon, a link having a hooked outer end and pivoted by the opposite end in the draw-head, the free end of the limb contacting with said link; a rockable tripping-arm spring-pressed toward the limb, and a finger actuated by the arm to laterally move the coupling-link on its pivot when said tripping-arm is rocked away from the pivoted limb, as specified.



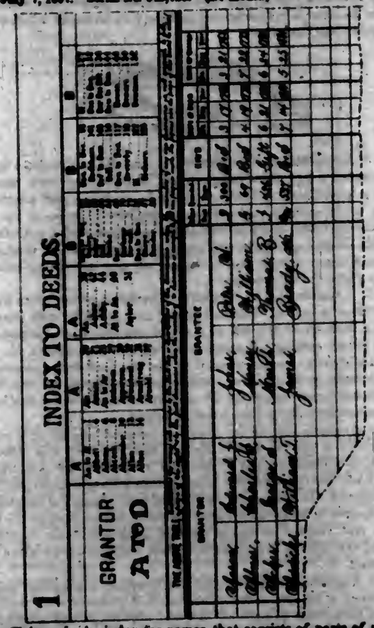
3. A car-coupling comprising a chambered draw-head, a spring-pressed limb pivoted in said draw-head near one side thereof, a coupling-link having a hooked outer end and pivoted near the opposite end of the draw-head, said link having a twisted side intermediate of its ends, adapted to interlock with a like side on a similar link when the latter is inserted in the draw-head, and a rockable tripping-arm adapted to actuate a tripping-finger which will press on the coupling-link for its release from a coupling-pin when said arm is rocked, as specified.

4. In a car coupling of the character described, a coupling-link comprising a bar flattened near each end, and notched at the side of one end to form a hook, the opposite end having a pivot-hole therein, and the ends of the links being held in parallel planes by a diagonally-disposed intermediate portion, said intermediate portion having one side twisted and the opposite side cylindric, as specified.

608,890. PRIMARY ELEMENT WITH REGENERABLE NEGATIVE ELECTRODE. OSKAR ROTHERED EDLER VON DOBOWALL and LEOPOLD OPPENHEIMER, Vienna, Austria-Hungary. Filed Dec. 9, 1896. Serial No. 615,064. (Model.) Patented in Germany Oct. 26, 1896, No. 92,627, and in Austria Nov. 9, 1896, No. 46/4,821.

Claim.—The process of manufacturing negative electrodes for primary batteries consisting in first preparing a peroxid plate of porous peroxid of lead on a lead frame then freeing this plate of air and moisture, then impregnating the peroxid with a water soluble concentrated electrolyte and then partially drying the electrodes so that they present dry surfaces, substantially as described.

608,891. SCREW. PHILIP W. CAMEL, Garner, Iowa. Filed Sept. 7, 1897. Serial No. 650,234. (No model.)



Claim.—1. As a new article of manufacture, a screw having its plain or unthreaded portion bent or curved and provided in its head with a slot, the bottom of which is at an angle to the face of the head, and perpendicular to the longitudinal axis of the body of the screw, as set forth.

2. As a new article of manufacture, a screw having the end of its shank next to its head bent or curved, and provided in its head with a transverse slot, tapering gradually from one end to the other, and having one end extending into the bent or curved shank, as and for the purpose set forth.

3. As a new article of manufacture, a screw having its plain or unthreaded portion bent or curved and provided in its head with a slot extending partially across the same, the bottom of the said slot being at an angle to the face of the head and perpendicular to the longitudinal axis of the body of the screw, as set forth.

608,892. INDEX. WARREN R. CLARK, Culpeper, Va. Filed July 7, 1897. Serial No. 643,720. (No model.)

Claim.—1. An index for names that consists of parts of names with means to indicate where the names are to be found, and full names, with means to indicate where such are to be found, full names of the same initial being in groups and parts of names being placed contiguous to a group of full names of the same initial letters, said parts being those of the first and last names of a group of names and having letters, after the initial letter, which, in alphabetical order, include the letters of like position in said group of full names, the said group of full names and parts of names being on the same page substantially as and for the purpose specified.

2. An index-book having on each record-receiving page, a table formed of parts of names, with means to indicate where the names are to be found, and full names, with means to indicate where such are to be found, the parts of names and full names being grouped together according to their initial letters, said parts of names of each group being those of the first and last of a group of names, and having letters after the initial letter, which, in alphabetical order, include the letters of like position in the full names of a group, substantially as and for the purpose described.

3. An index-book having at the top of each record-receiving page, a table formed by parts of names, with means to indicate where the names are to be found, and full names, with means to indicate where such are to be found, the parts of names and full names being arranged in columns and grouped according to their initial letters, said parts of names of a group being those of the first and last of a group of names, and having letters after the initial letter, which in alphabetical order, include the letters of like position in the full names of a group, substantially as and for the purpose set forth.

608,893. ASH-SIFTER. JAMES H. COMPTON and EDWARD W. COMPTON, Camden, N. J. Filed June 4, 1897. Serial No. 639,268. (No model.)

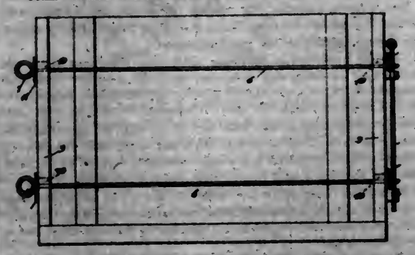
Claim.—1. In an ash-sifter, a sieve or screen, a chute located at one side of said screen, and a dumping-platform located at the opposite side of said screen, the platform and chute being arranged to move in concert and oppositely, substantially as described.

2. In an ash-sifter, a casing provided with a screening-surface and an outlet adjacent to said screening-surface, a dumping-platform located below the screening-surface, a supply-chute located above the screening-surface, and a door operated by the movement of the chute, the chute being also arranged to control the movement of the dumping-platform.

3. In an ash-sifter, a casing, a gravity supply-chute, a screening-surface below the supply-chute, a door adapted to control the opening through which the cinders are ejected, the door being connected with said chute and opened and closed by the movement thereof, a dumping-platform below said screening-surface, and a connection between the dumping-platform and chute, whereby the movement of one compels a movement of the other.

4. In an ash-sifter, the combination, with a casing provided with a screening-surface, of a dumping-platform, a supply-chute, and a door arranged to cover the opening through which the ashes are to be ejected, the movement of the supply-chute regulating the movement of the door and platform.

5. In an ash-sifter, the combination, with a casing having an opening in its bottom and an opening in its side, and a screen having a diagonal position in the casing, extending from its closed to its open side, of a dumping-platform located beneath the screening-surface, a pivoted chute located above the screening-surface, a door connected with the said chute, and a rod connecting the platform with the chute, the chute being of such length as to extend from side to side of the casing, and the connection between the chute and platform being such that when the chute is closed the platform will be opened to discharge its load.



6. In a sieve, a casing, a chute located above the screening-surface, pivoted in said casing and normally separating the upper from the lower portion of the casing, and a door connected with said chute, adapted to close the outlet of the casing, the door being opened and closed by the movement of the chute.

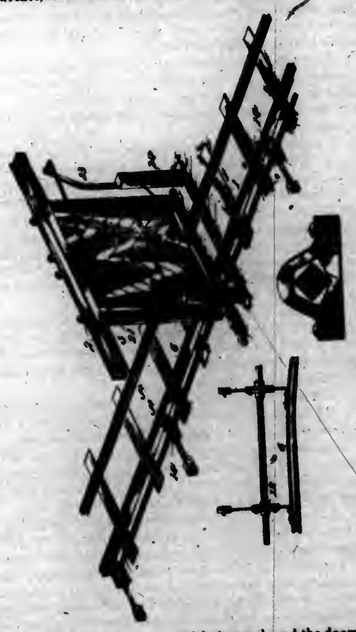
7. In an ash-sifter, a counterbalance-chute, and a door arranged to cover the outlet-opening of the sifter, and controlled by the said counterbalance-chute, and a sieve located between the two.

8. In an ash-sifter, a counterbalance-chute, and a door arranged to cover the outlet-opening of the sifter, and controlled by said counterbalance-chute, the said door being constructed in sections having a hinged connection, and a sieve located between the two.

9. In an ash-sifter, the combination, with a casing having an inclined screening-surface, a counterbalance-chute located above the screening-surface, extending from side to side and from front to rear, a door adapted to close the central outlet in the casing, the door being connected with the counterbalance-chute, and a dumping-platform located below the screening-surface and connected with the counterbalance-chute, the connection being such that when the chute is in normal position the platform will be in dumping position.

608,894. END-GATE FASTENING. JOHN S. COURT, Memphis, Tenn. Filed Dec. 15, 1897. Serial No. 662,003. (No model.)

Claim.—1. An end-gate fastening having a bolt provided at one end with a hand-ring and at the other end with an eye, two wear-plates provided with vertically-elongated slots through which the eyes of the bolts may pass, the bolt being capable of being turned to place the eye in horizontal position, and a rod running through said eye.



2. An end-gate fastening having two eyebolts, a wear-plate through which the eye of each bolt may be passed, the wear-plates having vertically-elongated slots therein and the bottom wear-plate having an internally-threaded socket, and a rod passed through the eyes of said bolts and having a threaded portion working in the socket.

3. An end-gate fastening having two eyebolts, a wear-plate for each eyebolt, each wear-plate having a vertically-elongated slot through which the eyes may be passed and each wear-plate also having a socket with vertically-extending interior walls, the lower socket being internally threaded, and a rod passed through the eyes and

through the sockets and having its lower portion threaded to coact with the threads of the lower socket.

4. A wear-plate for end-gate fastenings, having an opening or slot therein, and a socket adjacent to said opening, the socket having its interior walls extending parallel with the plane of the wear-plate.

608,895. DOOR-OPERATING MECHANISM. AUGUST DITTMAR, Lawrence, Ohio. Filed Dec. 16, 1897. Serial No. 662,105. (No model.)

Claim.—1. The combination, with the track and the doors above the track, of a rock-shaft formed in a plurality of lengths and secured together by coupling-boxes, lever mechanism connecting the doors and rock-shaft, means for operating the rock-shaft in one direction to open the doors, and weight-levers for operating the rock-shaft in the opposite direction for closing the doors, said weight-levers passing through the coupling-boxes and being longitudinally adjustable therein, as and for the purposes stated.

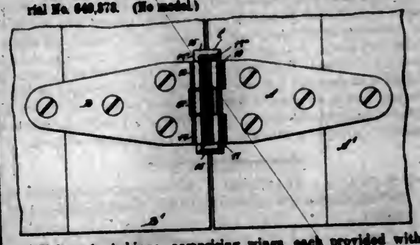
2. The combination with the track and the doors above the track, of an operating-bar alongside the track, a square rock-shaft alongside the track and connected to the operating-bar, bearings for the rock-shaft in which the latter is adapted to rock on edge, said bearings comprising a base-plate having an angular depression the meeting surfaces of which are at a greater angle than the meeting surfaces of the rock-shaft and a cap removably secured to the base-plate, the portion of said cap coming into contact with the edge of the rock-shaft being on an arc similar to the arc of the upper edge of the rock-shaft in movement, lever mechanism connecting the rock-shaft and doors, and weight-levers secured to the rock-shaft and to the operating-bar.

3. The combination, with the track and the doors above the track, of a rock-shaft alongside the track, an operating-bar adjacent to one rail of the track, an angle-lever secured to the rock-shaft and connected at one end to the operating-bar, a lever pivoted in the door-frame and having its lower end connected to the angle-lever, its upper end being connected to one of the doors, another lever also pivoted in the door-frame opposite the first lever and having its lower end connected to the remaining door, and a horizontal bar connecting the upper ends of said levers, substantially as and for the purposes stated.

608,896. COMBINED CHAIR AND BEDSTEAD. JOSEPH DIXON, London, England. Filed Dec. 28, 1897. Serial No. 663,963. (No model.) Patented in England July 9, 1896, No. 15,305, and Sept. 9, 1897, No. 20,750.

Claim.—1. A combined folding chair and bedstead, comprising a legged seat-frame, a back pivoted to the said seat-frame, and a brace pivoted on the said back, and provided with pivoted legs adapted to form extension-legs for the said brace, and legs for the said back when the latter is in an extended position for a bedstead, substantially as shown and described.

2. A combination folding chair and bedstead, comprising a legged seat-frame, a leg-rest slidable thereon and provided with separate legs, a back-frame pivoted on the said seat-frame, and adapted to form a bed extension therefor in an opposite direction to the said slidable leg-rest, a brace pivoted on the said back-frame, and adapted to fold thereon to support the frame, and extension-legs pivoted on the said brace, and adapted to engage the said back-frame, substantially as shown and described.

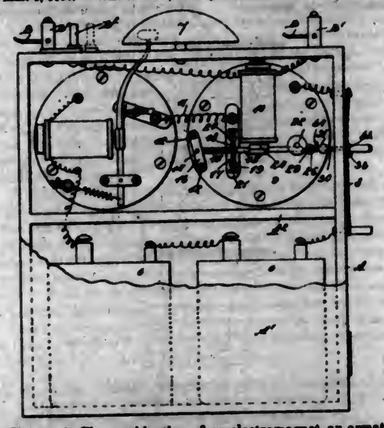


3. A combination folding chair and bedstead, comprising a legged seat-frame, a leg-rest slidable thereon, and provided with separate legs, a back-frame pivoted on the said seat-frame, and adapted to form a bed extension therefor in an opposite direction to the said slidable leg-rest, a brace pivoted on the said back-frame, extension-legs pivoted on the said brace, and adapted to engage the said back-frame, and means for locking the said brace in place on the said back-frame, substantially as shown and described.

4. A combination folding chair and bedstead, comprising a legged seat-frame, a leg-rest slidable thereon, and provided with separate legs, a back-frame pivoted on the said seat-frame, and adapted to form a bed extension therefor in an opposite direction to the said slidable leg-rest, a brace pivoted on the said back-frame, and adapted to fold thereon to support the frame, extension-legs pivoted on the said brace, and adapted to engage the said back-frame, and means for locking the said leg in place on the brace, substantially as shown and described.

5. A combination folding chair and bedstead, comprising a legged seat-frame, a leg-rest slidable thereon, and provided with separate legs, a back-frame pivoted on the said seat-frame, and adapted to form a bed extension therefor in an opposite direction to the said slidable leg-rest, a brace pivoted on the said back-frame, and adapted to fold thereon to support the frame, extension-legs pivoted on the said brace, and adapted to engage the said back-frame, and means for locking the said brace-leg in place at its fulcrum end on the said back-frame, substantially as shown and described.

6. A combination folding chair and bedstead, comprising a legged seat-frame, a leg-rest slidable thereon, and provided with separate legs, a back-frame pivoted on the said seat-frame, and adapted to form a bed extension therefor in an opposite direction to the said slidable leg-rest, a brace pivoted on the said back-frame, and adapted to fold thereon to support the frame, extension-legs pivoted on the said brace, and adapted to engage the said back-frame, substantially as shown and described.



608,897. HINGE. JOHN J. FARRAR, Rapid City, S. D., assignor of one-half to George C. Hunt, same place. Filed Aug. 26, 1897. Serial No. 649,578. (No model.)

Claim.—1. A hinge, comprising wings, each provided with a plurality of knuckles, one of the knuckles of one of the wings being out of alinement with the other knuckles thereof and extending between the knuckles of the other wing, and two connected pintles extending through alining knuckles, substantially as described.

2. A hinge, comprising two wings, one of said wings being provided with two knuckles spaced apart, and the other wing with three knuckles, the central one of which projects beyond the end of the wing and in front of the other knuckles thereof, said central knuckle extending between the knuckles of the other wing, and a link-plate, the side members of which pass through alining knuckles, substantially as described.

608,898. ALARM. IRA R. FRAMER, Rainbotown, Iowa. Filed Mar. 6, 1897. Serial No. 626,573. (No model.)

Claim.—1. The combination of an electromagnet, an armature-arm pivotally mounted adjacent to the electromagnet, an arm pivotally mounted above and bearing on the armature-arm, and a spring-pressed block bearing against one edge of the armature-arm and capable of engaging either side of the armature-arm according to the position to which said arm moves, substantially as described.

2. The combination of an electromagnet, an armature-arm pivotally mounted adjacent to the electromagnet and having each side of its free end reduced to form a plate, a tubular post, a block-spring pressed and sliding within the post, the block having a pin carried at its outer end and normally engaging one edge of the plate, the pin being capable of moving to either side of the plate according to the position to which the armature moves, and means for moving the block within the tubular post and against the tension of the spring, substantially as described.

3. The combination with a base-plate, of two posts carried by the base-plate, a plate carried by the posts, a pin rockably mounted in the plate and in the post-plate an armature-arm fixedly carried by the pin, a contact-plate carried by the pin and running parallel with the arm, a plate carried on and insulated from the base-plate, two posts rising from said insulated plate, a contact-screw carried by each post, the contact-screws being located respectively above and below the contact-plate and a magnet coactive with the armature-arm, substantially as described.

4. The combination with an armature-arm, of a tubular post, a block sliding in the post, a spring pressing the block, a pin carried by the block and movable through a slot in the tubular post, a rock-shaft mounted adjacent to the tubular post and a cam carried by the rock-shaft and capable of engaging the pin in the block, substantially as described.

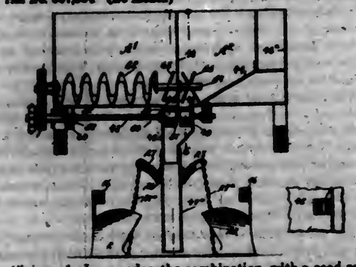
5. The combination of a magnet, an armature pivotally mounted adjacent to the magnet to swing toward and from the same, a spring-plate carried by the armature, and extending in the plane thereof, two contact devices between which the spring-plate is poised and a lead for the armature, the lead being pivoted to bear against the armature in opposition to the magnet, and the pivot of the lead being at an angle to the pivot of the armature.

6. The combination of a magnet, an armature arranged in front of the same, a device acting upon the armature for opposing the attractive influence of said magnet on its armature, and a steadying device acting against the armature and holding it in the plane of the neutralized forces, substantially as and for the purpose described.

7. The combination with an electromagnet arranged in a normally-closed main-line circuit, a subjacent armature-lever, a hinged and adjustably-weighted arm arranged at right angles to and resting upon the armature-lever to balance the attractive influence of the magnet, and two contact-posts arranged upon opposite sides of the armature-lever and both out of contact with the same when in its balanced position, and an alarm-circuit arranged to be closed by the movement of the armature-lever in either direction, substantially as and for the purpose described.

608,899. GARMENT-SUPPORTER. ROBERT GORTON, Newton, Mass. Filed May 15, 1897. Serial No. 636,805. (No model.)

Claim.—1. A garment-supporter device, comprising a metal frame having at one end means for attaching it to a garment, and provided with a cross-bar bridging the space between the upper and lower ends of the frame, and formed with flexible or bendable teeth pointing in the same general direction, and which are adapted to extend into and be turned inwardly upon the webbing, in combination with webbing, one end of which is attached to the cross-bar by the teeth which are turned down upon it.



2. A garment-supporter device, comprising a frame bridged by a cross-bar having teeth pointing in the same general direction crosswise of the bar, in combination with webbing one end of which is attached to the teeth and which is passed through the frame above and below the cross-bar and covers the front and rear faces and both longitudinal edges thereof.

3. A garment-supporter device, adapted to be attached to webbing, comprising a frame, a sheet-metal cross-bar whose ends are bent tightly around the sides of the frame, and which has teeth located opposite the face or inside the longitudinal edges of the cross-bar, and a bent-over lip at the edge of the bar adjacent to the end of the teeth, all substantially as and for th purpose set forth.

4. A garment-supporter device adapted to be attached to webbing, consisting of a frame made of wire and having its opposite sides, *c*, *c*, set in, a sheet-metal cross-bar having its ends bent around and secured to the set-in sides of the frame, and also having teeth located opposite the face or inside the longitudinal edges of the cross-bar, and a bent-over lip at the upper edge adjacent to the ends of the teeth, all substantially as and for the purpose set forth.

608,900. COMBINED COTTON-SEED PLANTER AND FERTILIZER-DISTRIBUTER. WALTER G. GRAY, Martynsburg, Tenn., assignor to himself, and THOMAS P. ALLEN, Elma, Ky. Filed Jan. 20, 1898. Serial No. 667,894. (No model.)

Claim.—1. In a seeder, the combination, with a seed-receptacle, a conveyer, means for driving the conveyer, and an agitator located over the outlet of the said receptacle and connected with the conveyer, of a grating located at the outlet of the seed-receptacle, and a seed-distributing cylinder mounted to revolve below the said grating and provided with teeth arranged to extend upward between the bars of the grating, as and for the purpose specified.

2. In a planter, a seed-receptacle provided with an outlet, a grating located at the outlet, means for feeding the seed toward said outlet, an agitator located over the outlet, and a seed-distributing cylinder mounted to revolve below the grating and provided with spirally-arranged teeth adapted to enter the spaces between the bars of the grating, for the purpose set forth.

3. The combination with a hopper divided into a seed compartment and a compartment for fertilizing material, the compartments being each provided with an outlet, a screw conveyer located in the seed-compartment and having a shaft at one end extending into the fertilizing compartment, an agitator located in each compartment over the outlet and secured to the said shaft on the screw conveyer, a distributing-cylinder located below the outlet of each compartment, a shaft upon which the said cylinders are mounted and a driving connection between the said shaft and the said conveyer, as and for the purpose specified

4. The combination with a receptacle provided with an outlet, a screw conveyer located in the receptacle and having a shaft at one end, an agitator secured to the said shaft and located over the outlet, a distributing-cylinder located below the outlet, a shaft upon which

the said cylinder is mounted, a sprocket-wheel loosely mounted on the outer end of the said shaft and provided with clutch-teeth on its inner face, means for driving the said sprocket-wheel, a sleeve held to slide on the said shaft and carrying a clutch adapted for engagement with the clutch-surface of the sprocket-wheel, the said sleeve also carrying a pinion adapted to mesh with a gear on the outer end of the screw conveyer, for the purpose set forth.

5. In a planter or like machine, a hopper divided into a seed-compartment and a compartment for fertilizing material, each compartment being provided with an outlet, a chute surrounding both of said outlets, an agitator in each compartment and mounted to revolve over the outlet thereof, a distributing-cylinder located below the outlet of each compartment and within the said chute, and a slide located within the compartment for fertilizing material and arranged to extend within the outlet thereof, the said slide being adjustable to and from the distributing-cylinder, for the purpose specified.

6. The combination, with a hopper divided into a seed-compartment and a compartment for fertilizing material, each compartment being provided with an outlet, the outlet in the seed-compartment being provided with a grating, of a screw conveyer located in the seed-compartment, an agitator located in each compartment over the outlet therefor, a distributing-cylinder located below the outlet of each compartment, the distributing-cylinder below the outlet of the seed-compartment being provided with pins arranged to enter the space between the bars of the grating, a feed-shaft upon which the said cylinders are mounted, and a driving connection between the said shaft, the conveyer and agitators, as and for the purpose specified.

7. The combination with a support and plow-beams carried by the said support and adjustable laterally and vertically, of a shifting lever having its pivot-pin secured thereto, the said lever being pivoted on a support between the said plow-beams, links connected with the plow-beams, and a connecting-bar attached at its ends to the said links, the pivot-pin of the said shifting lever being attached to the central portion of the connecting-bar, substantially as described.

8. The combination, with a support, and plow-beams carried by the said support, being adjustable laterally and vertically, of a beam between the plow-beams, provided with a ridge opener, a shifting lever, and a shifting connection between the said lever and the said plow-beams, for the purpose specified.

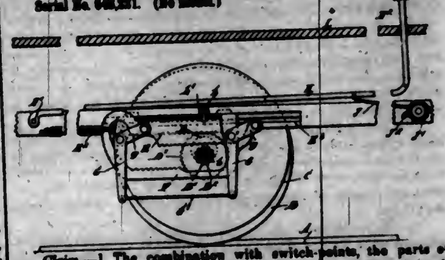
9. The combination, with a wheeled support, plow-beams pivotally attached to the said support, being capable of vertical and lateral movement, and a beam likewise pivoted to the support between the plow-beams, of a ridge-opener secured to the central beam, a shifting lever located on said central beam, links attached to the plow-beams, and a connecting-bar attached to said lever and to said links, as and for the purpose specified.

10. The combination, with a wheeled support, plow-beams pivotally attached to said support, being capable of vertical and lateral movement, and a beam likewise pivoted to the support between the plow-beams, of a ridge-opener secured to the central beam, a shifting lever located on said central beam, links attached to the plow-beams, and a connecting-bar attached to said lever and to said links, means for raising and lowering the beams, and a drag located at the rear of said frame, all combined for operation, as set forth.

11. The combination with a support, plow-beams pivotally attached to said support and capable of vertical and lateral movement, and a beam likewise pivoted to the support between the plow-beams, of a ridge-opener secured to the intermediate beam, a spring-lever pivoted on said intermediate beam and provided with a pin upon its under face adapted to engage one of a series of openings in a rack secured to the said intermediate beam, links connected with the plow-beams, a connecting-bar attached at its central portion to the pivot-pin of said lever and at its ends to the said links, and means for raising and lowering the beams, substantially as set forth.

12. The combination with a support, a hopper carried by said support and means for delivering the material from the hopper, of plow-beams provided with plows and also carried by said support, the said plow-beams being adjustable laterally and vertically, a beam also carried by said support and located between the plow-beams, a ridge-opener carried by said intermediate beam, a shifting device, a connection between the shifting device and the plow-beams, and means for closing the trench, substantially as described.

608,901. FENCE. THOMAS R. GREENE, Milburn, Ky. Filed Jan. 24, 1898. Serial No. 667,662. (No model.)



Claim.—1. In a fence or the like, a line-support, a master-picket rotatable upon said support, a guy-cable secured to said master-picket, and a projection upon said master-picket directly engaging the line-support for holding the master-picket against rotation; substantially as described.

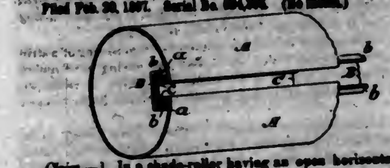
2. In a fence or the like, a line-support having an opening therein, a master-picket rotatable in said opening, a guy-cable wound upon said master-picket, and a staple in said picket and over the line-support for holding the master-picket against rotation by the guy-cable; substantially as described.

3. In a fence or the like, a line-support comprising two strands having an opening between them, a master-picket rotatable in said opening, a guy-cable wound upon said master-picket, and a staple in said picket and over one of the line-strands for holding the master-picket against rotation by the guy-cable; substantially as described.

608,902. RAILWAY-SWITCH. WILLIAM HAREN, Bellebridge, Pa., and WILBUR J. HAREN, Mount Pleasant, Ohio. Filed July 26, 1897. Serial No. 646,221. (No model.)

Claim.—1. The combination with switch-points, the parts of which are immovable and which comprise an auxiliary deflecting-rail alongside the track-rail, of a wheel mounted to turn upon an eccentrically-journaled shaft mounted on the car, and means for rotating said shaft to raise or depress the wheel, said wheel when in its lower position engaging the deflecting-rail to move the car sidewise, and in its upper position passing over the rails, substantially as described.

2. A car-switching device, comprising an auxiliary deflecting-rail alongside of the track-rails, a disk or cylinder eccentrically journaled on the car, a wheel journaled on the disk or cylinder, and adapted when depressed, to engage the deflecting-rail, means connected to the eccentric disk to rotate it, and an actuating connection from the disk to the car-axle, substantially as described.



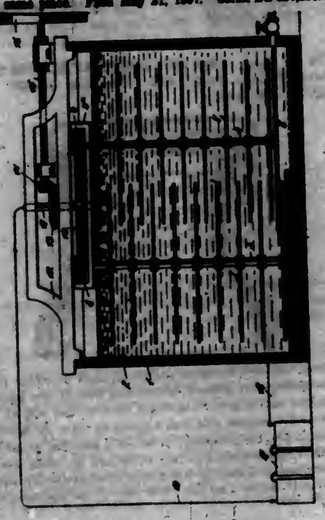
3. A car-switching mechanism, comprising a deflecting rail, a cylinder or disk eccentrically journaled on the car, a wheel mounted on said cylinder or disk and adapted when lowered, to engage the deflecting-rail, a gear-wheel attached to said disk and concentric with its journals, a pinion mounted upon the car-axle, and means for temporarily connecting said gear and pinion when desired, substantially as described.

4. A car-switching mechanism, comprising a deflecting-rail, a cylinder or disk eccentrically journaled on the car, a wheel mounted on said cylinder or disk and adapted when lowered, to engage the deflecting-rail, a gear-wheel attached to said disk and concentric with its journals, a reciprocable rack engaging said gear, a pinion upon the axle, a second reciprocable rack adjacent to said pinion, means for moving said second rack into and out of engagement with the pinion, and connections between the two racks, to reciprocate them together, substantially as described.

5. A car-switching mechanism, comprising a deflecting-rail, a cylinder or disk eccentrically journaled on the car, a wheel mounted on said cylinder or disk and adapted when lowered, to engage the deflecting-rail, a gear-wheel attached to said disk and concentric with its journals, a rack mounted to move horizontally and engaging said gear, a spring connected to said rack to hold and return it in one direction, a pinion upon the car-axle, a second rack adjacent to said pinion, means for moving said second rack into and out of engagement with the pinion, and link connections between the two racks, substantially as described.

6. A car-switching mechanism, comprising a deflecting-rail, a rotatable eccentric journaled upon the car, a deflecting-wheel journaled on the eccentric, a gear fixed to the eccentric and concentric with its journals, a rack engaging said gear and mounted to slide, a spring connected to the rack to hold it in one direction, a pinion mounted upon the car-axle, a second rack engageable with said pinion and having a recess at one end of its toothed portion adapted to engage the pinion to lock the rack, link connections between the two racks, an operating-lever, and sliding connections from the lever to the second rack by which said rack may be raised or lowered, substantially as described.

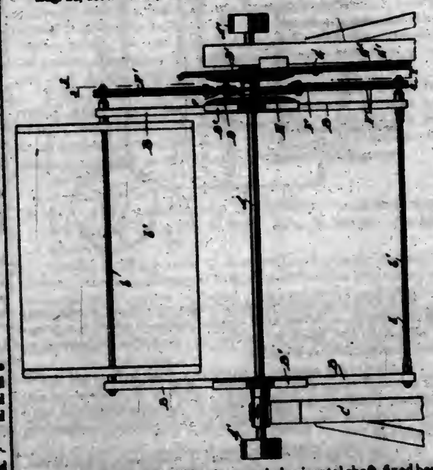
608,903. SHADE-ROLLER. BENJAMIN F. HARRISON, Newark, N. J., assignor to the Stewart Hardware Company, of New Jersey. Filed Feb. 20, 1897. Serial No. 624,204. (No model.)



Claim.—1. In a shade-roller having an open horizontal groove for securing the shade to the roller, a tube, a separate, detached groove-piece adapted to be attached to the edges of the tube; and means whereby the edges of the tube and open groove are joined and secured, substantially as described.

2. In a shade-roller having an open horizontal groove for securing the shade to the roller, in combination the tube A; detached groove-piece B; and means whereby the groove-piece is attached to the edges of the tube to form the open groove, substantially as described.

3. In a shade-roller having an open horizontal groove for securing the shade to the roller, in combination, the tube A; detached groove-piece B; and fastener C; whereby the groove-piece is attached to the tube and held open, substantially as described.



608,904. APPARATUS FOR EXTRACTING PRECIOUS METALS. JOSEPH R. HERAM, Butte, Mont., assignor of one-half to Frederick P. Gurney, same place. Filed May 21, 1897. Serial No. 637,599. (No model.)

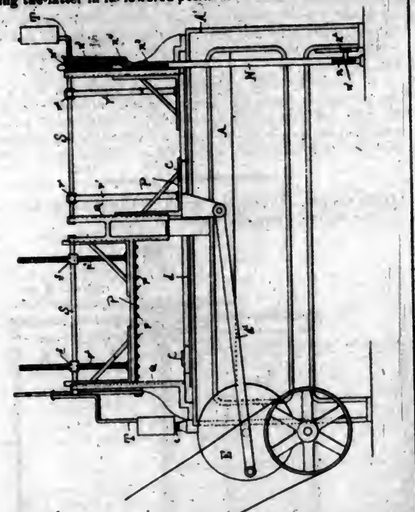
Claim.—1. An apparatus for extracting precious metals from their ores comprising a tank having an amalgamated copper lining forming a cathode and a multiplicity of agitators each rotating on its own axis and at the same time traveling around the tank, the said agitators forming an anode, and an electric circuit, substantially as specified.

2. The tank having a conducting-plate adapted to form a cathode, a rotatable frame, a conducting-agitator mounted rotatably on the frame and upon an axis eccentric to that of the frame, means for connecting the agitator and plate to a source of electric current, and means for rotating the agitator and frame, substantially as specified.

608,905. WINDMILL. SETH K. HUMPHREY, Boston, Mass. Filed Aug. 26, 1897. Serial No. 649,880. (No model.)

Claim.—1. A windmill having a main horizontal shaft, fixed bearings for said shaft, arms carried on said shaft, vanes carried by said arms on horizontal journals, crank-arms fixed to the vane-journals, an eccentric mounted to rotate about the main shaft at one-half the speed thereof, a strap surrounding said eccentric, and connections from said strap to the crank-arms upon the main journals, substantially as described.

2. A windmill having a main horizontal shaft, fixed bearings for said shaft, arms carried on said shaft, vanes carried by said arms on horizontal journals, crank-arms fixed to the vane-journals, an eccentric mounted to rotate about the main shaft at one-half the speed thereof, a strap surrounding said eccentric, connections from said strap to the crank-arms upon the vane-journals, and means for shifting the angular position of the said eccentric to throw the vanes into an inoperative position, substantially as described.



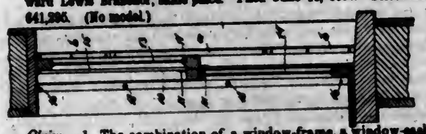
3. A feathering device for windmills of the class herein described, comprising a frame pivoted concentric with the windmill-shaft and carrying three or more rollers, said rollers being tangent to a circumscribed eccentric circle, a ring surrounding said rollers, connections from said ring to the vanes for oscillating them, a bevel-gear attached to the wheel-shaft, and a similar wheel fixed to the mill-supports and facing the first-named wheel, and a bevel-pinion carried by the eccentric-frame and engaging both gears, substantially as described.

4. A feathering device for windmills of the class herein described, comprising a frame pivoted eccentric to the windmill-shaft and carrying three or more rollers, said rollers being tangent to a circumscribed eccentric circle, a ring surrounding said rollers, connections from said ring to the vanes for oscillating them, a bevel-gear attached to the wheel-shaft and a similar gear fixed to the supports and facing the first gear, said latter gear being adapted to have a limited oscillation, arms connected thereto, cords or similar connections from said arms for operating them from a distance, and a bevel-pinion carried by the eccentric-frame and engaging both gears, substantially as described.

608,906. MACHINE FOR SIZING HAT-BODIES. CHARLES E. KEATOR, Brooklyn, N. Y., assignor of one-half to the Dunlap & Company, same place and New York, N. Y. Filed Nov. 20, 1897. Serial No. 659,272. (No model.)

Claim.—1. A hat-sizing machine comprising a water-tank, a re-

ciprocating bed therein, a vertically-adjustable presser and means for locking the latter in its lowered position.



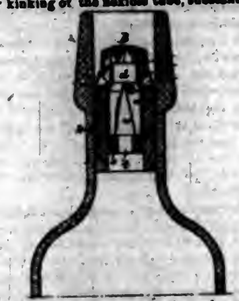
2. A hat-sizing machine, comprising a water-tank, a reciprocating bed therein, a presser, fixed vertical guides on which said presser is adjustable, and means for locking the presser in its lowered position, substantially as described.

3. A hat-sizing machine, comprising a water-tank, a bed therein and means for reciprocating the bed in the tank, in combination with a presser, means for locking the latter in the lowered position and a counterweight to automatically raise it when released, substantially as described.

4. A hat-sizing machine comprising a water-tank, a bed therein, and means for reciprocating the bed in the tank, in combination with a presser, vertical guides for the latter, means for locking the presser in the lowered position, a counterweight to automatically raise it when released and releasing devices controlled by a treadle, substantially as described.

5. A hat-sizing machine, comprising a water-tank, a bed therein, horizontal guides on which the bed may slide and means for reciprocating the bed on its guides in combination with a presser, fixed vertical guides on which the presser is adjustable, and means for locking the presser in its lowered position, substantially as described.

603,907. SASH-HOLDER. JOHN LEASK and THOMAS W. LEASK, Gore Bay, Canada, assignors of two-thirds to Herman Carrie and Edward Lewis Brannor, same place. Filed June 16, 1897. Serial No. 641,295. (No model.)



Claim.—1. The combination of a window-frame, a window-sash movable therein, and a plate having an edgewise spring, the plate exerting its edgewise pressure between the sash and frame whereby to hold the sash.

2. The combination of a window-frame, a window-sash sliding therein, and a plate forming a window-head, the plate having each end rigidly secured to the window-frame and having at its intermediate portion an edgewise spring toward the window-sash, one edge of the plate at the said intermediate portion thereof bearing against the sash to hold the sash.

603,908. BOTTLE-STOPPER. EDWIN I. LLOYD, Philadelphia, Pa. Filed May 6, 1896. Renewed Apr. 6, 1897. Serial No. 631,318. (No model.)

Claim.—1. A bottle-stopper having a projecting valve consisting of a tube of flexible material secured at one end and provided at the free end with a weight, whereby the tube will be straightened when the bottle is held with the mouth downward, the weight falling by gravity when the bottle is held with the mouth upward, so as to cause the folding or kinking of the flexible tube, substantially as specified.

2. A bottle-stopper having a projecting valve with flexible lipped outlet, one or more air-inlet openings being formed in the valve behind said outlet, substantially as specified.

3. A bottle-stopper having a projecting valve with flexible lipped outlet, said valve also having formed in it one or more air-inlet openings with flap-valve for closing the same, substantially as specified.

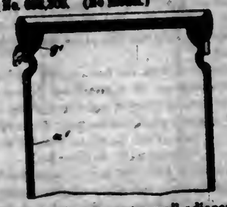
4. A bottle-stopper having a projecting valve consisting of a strip of flexible waterproof material folded upon itself and having the edges united throughout a part of its length, the edges at and near the fold being free so as to form lips, substantially as specified.

5. A bottle-stopper having a projecting valve consisting of a strip of waterproof material folded upon itself and having overlapping edges throughout a portion of its extent, the portion in which the edges are not overlapped forming opposite lips, substantially as specified.

6. A bottle-stopper consisting of a tubular block having an external label visible through the bottle neck, a detachable cap having projecting lugs, and depending wires hung to said lugs and engaging with the label, substantially as specified.

603,909. SAW-FILE. Parnell Lord, Worcester, Mass. Filed July 31, 1897. Serial No. 646,578. (No model.)

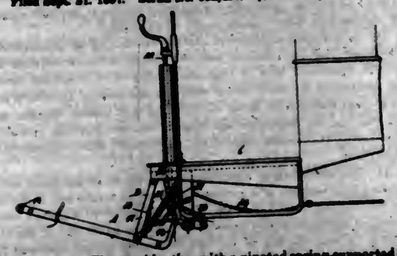
Claim.—1. The combination in a saw-file, of a flat body and a series of pointed, file-like ribs on said body arranged with spaces between said ribs equal in width to two adjacent saw-teeth and greater in depth than the length of said teeth, substantially as and for the purpose set forth.



2. The combination in a saw-file, of a flat body and a series of pointed, file-like ribs on the same arranged at an angle corresponding to the bevel of the cutting edge of saw-teeth, said ribs having spaces between them equal in width to two adjacent saw-teeth and greater in depth than the length of said teeth, substantially as and for the purpose set forth.

603,910. JAR AND TEMPORARY CLOSURE THEREFOR. JULIAN P. LYON, Detroit, Mich. Filed Aug. 21, 1897. Serial No. 648,035. (No model.)

Claim.—A jar, the upper portion or neck of which is provided with a rabbet-groove located in the inner wall of said upper portion or neck, the rabbet-groove having a bottom wall and an upwardly and outwardly inclined side wall running up from the bottom wall, a jar having a cap, the periphery of which is provided at its lower portion with a rabbet-groove having a top and an inner side wall, the rabbeted portion of the cap being capable of projecting into the rabbet-groove of the jar, and the lower face of the cap being capable of bearing upon the bottom wall of the rabbet-groove in the jar, and the jar having a ring-gasket lying in the rabbet-groove of the cap, the gasket bearing against the top and side walls of the rabbet-groove in the cap, and the gasket being crowded firmly into the space between the side walls of the rabbet-grooves of the jar and in the cap, as the cap is moved downward, whereby to hermetically seal the jar, and the upper wall of the rabbet-groove in the cap being located out of contact with the jar when the cap is in closed position to permit access to the gasket for breaking the vacuum held thereby.



603,911. JAR. JULIAN P. LYON, Detroit, Mich. Filed Sept. 20, 1897. Serial No. 652,208. (No model.)

Claim.—1. A jar having its outer wall adjacent to the mouth disposed perpendicularly and having an annular rib run around its outer side at the base of said perpendicular wall, and the rib having a recess at one point, the recess extending into the rib toward said perpendicular wall, and a cap having a web or main portion extending over the mouth of the jar to close the same, the cap having at its edges a downwardly-projected flange extending into proximity to the outer portion of the rib on the jar, and the inner side wall of the flange being disposed diagonally downward and outward, said wall extending from the upper edge of the perpendicular wall of the jar downward to the outer portion of the upper face of the rib, and beyond the inner wall of the recess in said rib, the space between the said perpendicular wall of the jar and the inner wall of the flange serving to accommodate a gasket.

2. A jar having its outer wall adjacent to the mouth disposed perpendicularly, the jar also having an annular rib running around said perpendicular wall and projecting out therefrom, the rib having a recess therein which extends inward to the perpendicular wall so as to completely cut away the rib at the point of the recess, and a cap having a web or main portion extending over the mouth of the jar to close the same, and a cap having at its edges a downwardly-extending flange running into proximity with the outer portion of the rib, and the flange having its inner side wall disposed diagonally and extending from the upper edge of the said perpendicular wall of the jar downward and outward to the outer portion of the upper face of the rib, the space between the said perpendicular wall of the jar and the inner wall of the flange serving to accommodate a gasket.

603,912. CAR-FENDER. ISAAC MACOWEN, New York, N. Y. Filed Sept. 21, 1897. Serial No. 652,467. (No model.)

Claim.—1. The combination with a pivoted spring-supported fender of a brake-shaft and frictional connection between the same and the fender by which the fender is depressed when the brake is applied.

2. The combination, with the brake-shaft of a car, a clutch carried by the shaft, and a drum operated by the said clutch, of a fender capable of being raised and lowered, and a flexible connection between the fender near its fulcrum and the said drum on the brake-shaft, as specified.

3. The combination, with the brake-shaft of a car, a clutch secured to the shaft, a drum loosely mounted on the shaft, and a spring holding the said drum in engagement with the said clutch, of a pivoted fender, a flexible connection between the drum and fender at the rear of its pivot, and springs attached to a fixed support and to the said fender at its sides in front of its pivot, the springs serving to normally hold the fender in an upper position, for the purpose specified.

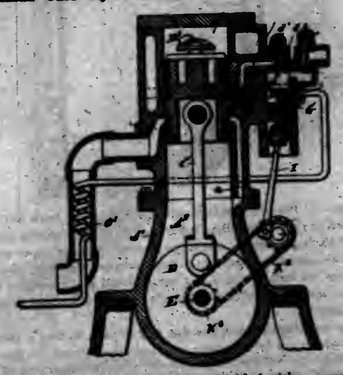
4. The combination, with hangers, and a rock-shaft journaled in the said hangers, of a fender consisting of a body portion provided with upwardly and rearwardly extending arms at its rear end, which arms are secured to the said rock-shaft, a back pivoted upon the body, and a tension device normally holding the back at an angle to the body, and springs attached to the body at its sides forward of the rock-shaft, the said springs being adapted for attachment at their opposite ends to a fixed support, and a friction connection from the brake-shaft to the fender from which it is automatically depressed when the brake is applied for the purpose specified.

5. The combination, with the platform of a car, hangers projected from the platform, and a rock-shaft journaled in the said hangers, a fender attached to the said rock-shaft, and a crank-arm projected rearwardly from the rock-shaft, of a brake shaft for the car, a clutch secured to the brake-shaft, a drum loosely mounted on the said shaft, a spring holding the said drum in engagement with the said clutch, and a chain attached to the said drum and to the crank-arm of the rock-shaft for the purpose set forth.

6. The combination with a pivoted fender having a yielding supporting means with a brake-shaft, a drum mounted to rotate and having a chain or similar flexible connection to the fender and frictional connections from said drum to the brake-shaft whereby the fender is depressed when the brake is applied.

603,918. LACQUER AND LACQUERING. DAVID MARCUS, London, England. Filed Aug. 30, 1897. Serial No. 650,054. (No specimens.)

Claim.—1. The process of lacquering or covering surfaces by applying thereto a mixture of the juice of the *Rhus vernicifera* and permanganate of potash and then a mixture of the said juice with drop-black or chrome thinned with methylated spirit and then a mixture (thinned with absolute alcohol), of the said juice, with a substance obtained by passing the vapor arising from heated copal and camphor through litharge.



2. The process of lacquering or covering surfaces by applying thereto a mixture of the juice of the *Rhus vernicifera* and permanganate of potash and then a mixture (thinned with absolute alcohol) of the said juice with a substance obtained by passing the vapor arising from heated copal and camphor through litharge.

3. For lacquering or covering surfaces, a material formed by the mixture of the juice of the *Rhus vernicifera* with the product of condensation of vapor from heated copal and camphor passed through litharge, the mixture being thinned with absolute alcohol.

4. For lacquering or covering surfaces, a material formed by the mixture with the juice of the *Rhus vernicifera* of from five to ten per cent. of the product of condensation of the vapor from heated copal and camphor passed through litharge, the mixture being thinned by the addition of from three to seven per cent. of absolute alcohol.

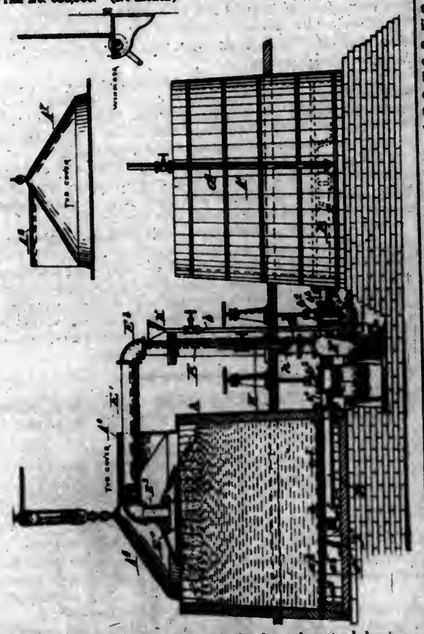
5. For lacquering or coating surfaces, the mixture of the juice of the *Rhus vernicifera* with a product obtained by passing the vapor from heated copal and camphor through litharge.

603,914. GAS OR OIL ENGINE. FRANK S. MEAD, Montreal, Canada. Filed July 26, 1886. Serial No. 650,750. (No model.)

Claim.—1. A gas or oil engine, provided with a spraying device adjacent to the working chamber, and an air-compression pump whose valved delivery-port is connected to said spraying device, the delivery-valve being controlled directly by the movement of the pump-

piston, for injecting a spray of liquid fuel into the working chamber after the exhaust is closed, substantially as described.

2. A gas or oil engine, provided with two tubes or channels leading into the working chamber and of which one surrounds the other, and an air-compression pump whose valved delivery-port is connected to one of said tubes or channels, the delivery-valve being controlled directly by the movement of the pump-piston, for injecting a spray of liquid fuel into the working chamber after the exhaust is closed, substantially as described.



3. In a gas or oil engine, a power-cylinder, a channel for the supply of compressed air, a channel for the supply of liquid fuel, a passage leading from both the said channels to the cylinder, and a movable body, such as a piston, actuated by the engine and so arranged as to control the admission of both air and fuel to the cylinder, substantially as shown and described.

4. In a gas or oil engine, a power-cylinder, an air-compression pump adjacent thereto, a supply-channel for liquid fuel and a passage therefrom to the cylinder, and a groove or cross-passage in the plunger of said pump for controlling the passage of said fuel to the said cylinder, substantially as shown and described.

5. In a gas or oil engine, an air-compression pump, the plunger of which is arranged to control its air-delivery port, said plunger having a groove or passage for controlling the supply of fuel to the engine, substantially as shown and described.

6. An explosive-engine whose piston is provided on its working face with a vaporizer having a series of spaced ridges, in combination with a fuel-injector arranged to discharge the fuel in a direction parallel to said ridges, substantially as described.

608,915. APPARATUS FOR DYEING. ALEXANDER F. MELROSE and HENRY B. VAN DUSEN, Pittsfield, Mass. Filed Sept. 8, 1897. Serial No. 650,908. (No model.)

Claim.—1. The combination with the dye tub or tank having a foraminated or reticulated false bottom, of circulation-piping for the dye liquor having a central discharge-sprayer over the upper end of the tub, and a central suction-box in the space between said false bottom and the tub-bottom: said box being closed at its top and open below to permit the liquid to flow therein from all directions, substantially as described.

2. The combination with the dye tub or tank having a foraminated or reticulated false bottom, of circulation-piping for the dye liquor having a central discharge-sprayer over the upper end of the tub and a suction-box in the space between the false bottom and tub-bottom: said box being closed at the top, open at the bottom and there provided with a depending flange the lower edge of which is located above the tub-bottom, substantially as described.

3. The combination with the tub or tank having a foraminated or interstriced false bottom, of a suction-box below having an inlet-opening in its bottom at the center of the tub, a steam-head on the said box and having its discharge at the center of the tub, a supply-pipe for the head and a circulation-piping connected to said suction-box and provided at its discharge end with a spraying or distributing device over the tub; substantially as described.

4. The combination with a tub or vat and its foraminated or reticulated false bottom, of valved piping extending from the bottom of the tub over the upper end thereof and there provided with a spraying or distributing device, a pump for forcing the liquor through the piping, a valved cold-water pipe connected to the circulation-piping at the suction side of said pump, a steam-pipe discharging into the circulation-piping to heat the contents (liquor or cold water) and a steam-pipe discharging into the tub below its false bottom; substantially as described.

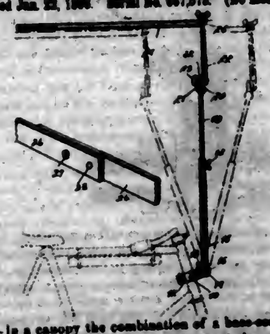
5. The combination with the tub or tank having a foraminated or reticulated false bottom, of a pump and piping for drawing the liquor from the bottom of the tub and distributing it over the upper end thereof, and a steam-pipe discharging forwardly into said piping at the discharge side of the pump to assist it as an injector and also heat the liquor; substantially as described.

6. The combination with the tub or tank having a reticulated or foraminated false bottom, valved circulation-piping extending from the bottom of the tub over the top thereof, and provided between its ends with a liquid-forcing device to cause a continuous circulation through the pipe and tank, and a dye-receptacle K having a valved connection *k* at its lower end with the circulation-pipe at the suction side of the forcing device to permit the dye to flow down into the pipe and be thoroughly mixed with the liquor by said forcing device; substantially as described.

7. A dyeing apparatus comprising a tank having a perforated or reticulated false bottom, a valved steam-pipe discharging into the tank below said false bottom, a circulation-pipe exterior to the tank, in communication therewith at the top and bottom and operating separately and independently thereof, a forcing device between the ends thereof, and a dye vessel K having a valved outlet *k* secured at its lower end to the circulation-pipe just in advance of the forcing device, the dye being adapted to flow by gravity from vessel K into the circulation-pipe and be mixed with the liquor by the forcing device; substantially as described.

8. A dyeing apparatus comprising a plurality of tubs having false bottoms, valved suction-pipes leading from the bottoms of said tubs, a pump to the inlet side of which said suction-pipes are connected, a discharge-pipe leading from the pump and provided with a vertical member having a horizontally-swinging section adapted to be swung over all of the tubs and there provided with a sprayer or distributer, steam-pipes discharging into the bottoms of the tubs to heat the contents, a valved cold-water pipe connected to the piping at the suction side of the pump, a steam-pipe discharging forwardly into the piping at the discharge side of the pump and a dye-supply communicating with the piping at the suction side of the pump; substantially as described.

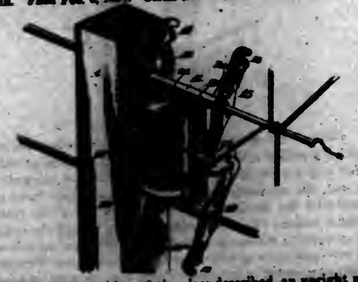
9. In a dyeing apparatus, a suction-box having an inlet-opening at the inner end of its bottom, and a steam-head on the inner end of the box and having upwardly-discharging outlets at opposite sides of said suction-box inlet; substantially as described.



10. In a dyeing apparatus a suction-box having an inlet-opening at the inner end of its bottom and provided on the outer sides of said end with apertured ears or lugs, and a forked or branched steam-head embracing the inner end of said box and having apertured ears or lugs registering with those on the box and bolted thereto, said head also having discharge openings or nozzles opening upwardly and inwardly at opposite sides of the suction-box inlet; substantially as described.

11. The combination with the tub having a foraminated or reticulated false bottom, of a suction-box secured to the tub under the false bottom and provided at the center thereof with a bottom inlet-opening, a circulation-pipe extending from the outer end of the suction-box up over the top of the tub, a forcing device between the ends of the circulation-pipe, a steam-head on the inner end of the suction-box and having discharge-nozzles opening upwardly and inwardly at opposite sides of the suction-box inlet, and a steam-pipe connected with said head; substantially as described.

12. A dyeing apparatus comprising a tub or vat, having a foraminated or reticulated false bottom and a suspended vertically-movable cover provided with a hooded side opening, a circulation-pipe extending from the bottom of the tub and provided with a horizontally-swinging member extending through said hooded top opening, a forcing device for the liquid in the circulating-pipe, and a steam-pipe discharging into the bottom of the tank to heat its contents; substantially as described.



13. The combination with the tank having a foraminated or reticulated false bottom, of a circulating-pipe connected with the bottom of the tank and having a horizontal section extending over the top of the tank and there provided with a depending pipe E^3, a spray-plate suspended under the end of pipe E^3 and a hood E^4 secured to said pipe and extending out beyond the periphery of said spray-plate; substantially as described.

608,916. BICYCLE-CANOPY. JAMES J. MEEHAN, Cleveland, Ohio. Filed Jan. 22, 1898. Serial No. 667,573. (No model.)

Claim.—In a canopy the combination of a base-section capable of being attached to the stem of a bicycle, a tubular standard supported on the base-section, a rod adjustably held in the tubular standard, a block located at the upper end of the rod, a thumb-screw adjustably holding the block on the rod, two pivotally-connected members mounted on the block and forming a fork, the arms of which extend upward and outward in opposite directions, and a canopy proper having the upper ends of the said members attached thereto, whereby to sustain the canopy proper adjustably in place.

608,917. WIRE-FENCE MACHINE. OLIVER A. MORROW, Whitehall, Ill. Filed Feb. 6, 1897. Serial No. 622,262. (No model.)

Claim.—1. In a machine of the class described, an upright provided with weaving devices and with rollers, a winding-drum mounted upon said upright and connected with a cable or wire having a clutch, a pivoted lever and pawl for rotating said winding-drum, and a device for adjusting the movement of said pivoted lever.

2. In a machine of the kind specified, an upright provided with weaving devices and with rollers, a winding-drum having a cable and clutch, a pawl upon said upright to engage a ratchet-wheel carried by said winding-drum, a pivoted lever having a pawl to engage said ratchet-wheel, and an adjustable stop situated in the path of said pivoted lever.

3. In a machine of the kind specified, an upright provided with devices for moving the same, a plurality of hollow rotatable spindles geared together to rotate in the same direction, a pair of arms carried by each of said spindles and having jaws, and spools provided with trunnions adapted to enter said jaws.

4. In a machine of the kind specified, an upright provided with devices for moving the same, a plurality of hollow rotatable spindles geared together to rotate in the same direction, a pair of arms carried by each of said spindles, jaws upon said arms, and spools provided with trunnions adapted to enter said jaws, said trunnions being provided with shoulders or ribs.

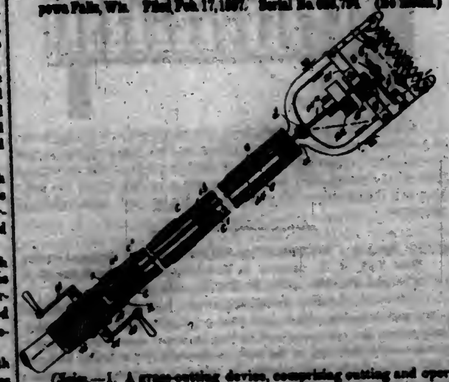
5. In a machine of the kind specified, an upright provided with devices for moving the same, a plurality of hollow rotatable spindles geared together to rotate in the same direction, arms carried by said spindles and provided with jaws, the corresponding jaws on the arms of adjacent spindles being set in opposite direction, and spools provided with trunnions adapted to enter said jaws.

6. In a machine of the kind specified, the combination with two adjacent rotatable hollow spindles geared together to rotate in the same direction, of arms mounted upon said spindles, said arms being arranged in pairs and situated diametrically opposite upon said spindles, the arms on adjacent spindles being situated a little out of alinement whereby they can pass one another, and spools provided with trunnions to enter said jaws.

7. In a machine of the kind specified, the combination with two adjacent hollow rotatable spindles geared together to rotate in the same direction, of diametrical oppositely-arranged pairs of arms mounted upon each of said spindles, each of said arms being provided with a pivoted outer end section, and a spring for holding said outer end section normally in alinement with the main portion of the arms.

8. In a machine of the kind specified, a hollow rotatable spindle having oppositely-arranged pairs of arms, each of said arms having an outer pivoted section, and a spring for holding said section normally in alinement with the main portion of the arm, said section being provided with a jaw across which said spring extends.

9. In a machine of the kind specified, a hollow rotatable spindle having oppositely-arranged pairs of arms, each of said arms having an outer pivoted section, and an adjustable spring for holding said section normally in alinement with the main portion of the arm, said section being provided with a jaw across which said spring extends.



10. In a machine of the kind specified, a hollow rotatable spindle having a pair of arms, each of said arms having an outer pivoted section, a spring for holding said sections normally in alinement with the main portion of the arms, said section being provided with a jaw across which said spring extends, and a second spring bearing at its opposite ends against said pivoted section and the main portion of said arm.

608,918. FRUIT-PICKER. PATRICK HOURE, Easthampton, Mass. Filed Aug. 13, 1897. Serial No. 648,119. (No model.)

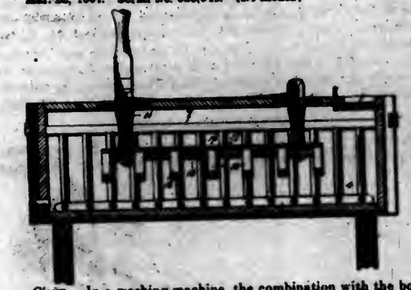
Claim.—A fruit-picker comprising, in combination, a handle 1 provided with a socket 2 having an arm 3 carrying a guide-collar 4 provided with a set-screw 5, a fixed rod 6 fitted in said socket and guide-collar and carrying a guide-collar 8, an extensible rod 7 sliding in said collar 8 and forked or bifurcated at its outer end, a stationary jaw consisting of an approximately triangular-shaped frame formed at its lower end with a pivot-eye fitted in the bifurcation of said rod and at its upper end with oppositely-disposed eyes and a semicircular-shaped, outwardly-flaring jaw, a set-screw on the rod engaging said pivot-eye, a semicircular movable jaw provided with pintles having bearing in said eyes and a crank-arm, a fruit-receiving sack attached at its open end to both jaws and at its lower end to the frame of the stationary jaw, a reel on the handle, and a cord connecting between said reel and crank-arm of the movable jaw, substantially as described.

608,919. GRASS-CLIPPING DEVICE. JOHN MCCALLUM, Chippewa Falls, Wis. Filed Feb. 17, 1897. Serial No. 623,784. (No model.)

Claim.—1. A grass-cutting device, comprising cutting and operating mechanisms, a guiding-handle formed in two parts screw-threaded on each other, each part having one of said mechanisms attached thereto, and an arm mounted upon one part having a locking-pin thereon, the adjacent end of the other part having a series of holes

arranged on a spiral corresponding to the thread of the connection and adapted to receive said locking-pin, substantially as described.

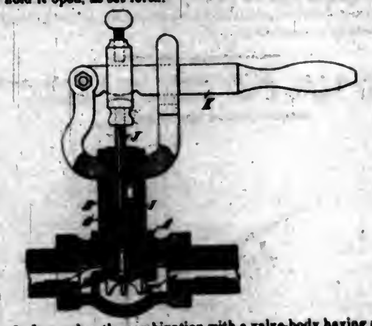
2. A grass-cutting device, comprising a reciprocating cutter-bar, a frame for the cutting mechanism, a joint of the operating-shaft mounted thereon and provided with a fly-wheel, a controlling-handle secured thereto so as to be adjustable in a vertical angle, an operating mechanism mounted on the handle above the said adjustable connection, and a power connection therefrom to the fly-wheel shaft by a universal or tumbling joint, substantially as described.



3. In a grass-clipping implement, of the character described, the tubular handle-bar composed of sections that are joined together by threaded connections, two sections being adjustably held at a desired point of rotatable adjustment by a detent-finger secured on one handle-bar section, and having a toe that may engage with any one of a series of perforations formed in the other handle-bar section, substantially as described.

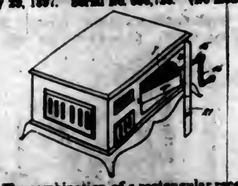
603,920. PROCESS OF PASTEURIZING LIQUIDS. JOHN H. W. OETMANN, Hamburg, Germany, assignor to Herman Leonhardt, same place. Filed Oct. 28, 1896. Serial No. 610,373. (No specimens.) Patented in Norway Mar. 21, 1896, No. 4,576; in Germany June 10, 1896, No. 82,470; in Sweden Feb. 13, 1896, No. 6,635; in Denmark May 13, 1896, No. 537; in Belgium Oct. 25, 1896, No. 123,700; in Austria Jan. 28, 1897, No. 47/305; in Canada Mar. 10, 1897, No. 55,230; in Hungary Apr. 23, 1897, No. 8,104, and in England June 5, 1897, No. 1,208.

Claim.—The herein-described process of pasteurizing beer and other carbonated liquids consisting in passing the liquid through a lengthy system of connected horizontal pipes with vertical undulations, said system being heated at one end and cooled at the other end, the liquid being admitted into the heated part of said pipes so as to pasteurize it, and said liquid being then passed on through the undulations of the pipes, whereby any gas freed from the liquid is retarded in its flow by the bends and divided into numerous small portions which are trapped in the upper part of the undulations of the pipes and therein subjected to and commingled with the liquid flowing through the pipes, until the gas is reabsorbed by the liquid and the latter cooled, substantially as and for the purpose described.



603,921. WASHING-MACHINE. PETER PETRI, Peoria, Ill. Filed Mar. 22, 1897. Serial No. 628,641. (No model.)

Claim.—In a washing-machine, the combination with the body, of a slotted cover therefor, a leaf spring secured intermediate its ends to said cover, levers pivoted to the respective ends of said spring and depending through said slotted cover, and a rubber within the body to which the opposite ends of the levers are pivoted, substantially as described.



603,922. DIFFERENTIAL-PISTON VALVE. NICHOLAS POWER, New York, N. Y., assignor to Philip Brandes, White Plains, N. Y. Filed Feb. 21, 1896. Serial No. 580,221. (No model.)

Claim.—1. A valve, comprising a valve-body having an inlet and outlet and provided with a valve-seat, a cylinder secured to the valve-body above the valve-seat and having its lower open end in communication with the inlet of the body, a piston in the cylinder and provided with a loosely-sliding stem by which it is operated and with a stem projecting from its lower end, and a valve loosely mounted on the stem projecting from the lower end of the piston and adapted to rest upon the valve-seat, the area of the top of the valve being greater than that of the piston, whereby the valve is held to its seat and when raised from its seat, the pressure of the fluid on the lower end of the piston will cause it to slide upward to wholly open the valve and hold it open, as set forth.

2. In a valve, the combination with a valve-body having an inlet and outlet and provided with a valve-seat, and a cylinder secured to the body above the valve-seat and in communication with the inlet of the body, of a piston in the cylinder, a stem adjustably secured to the lower end of the piston, a valve mounted to turn on the lower end of the stem and adapted to rest upon the valve-seat, a stem secured to the upper end of the piston and freely sliding in the cap of the cylinder, and an operating-lever to which the last-named stem is secured, areas of faces of the valve and piston being so proportioned that the valve will be normally held to its seat and that on slightly lifting the valve, the fluid-pressure will entirely open the valve and hold it open, substantially as herein shown and described.

603,923. COFFEE-ROASTER. WILLIAM R. RAMSEY, Kane, Oreg. Filed May 29, 1897. Serial No. 638,736. (No model.)

Claim.—The combination of a rectangular receptacle, one end of which is provided with a bearing and the opposite end of which is provided with a downwardly horizontally and thence upwardly extending slot, the upwardly-extending portion of which forms a bearing alined with the bearing in the first-named end of the receptacle, a cylinder located within the receptacle, one head of the cylinder having an opening therein, a hingedly-mounted plate capable of swinging over said opening to close the same, a shaft run through the cylinder and mounted in the aforesaid bearings, the shaft being connected and disconnected with the receptacle through the medium of the slot in one head thereof, and a handle attached to the shaft whereby the shaft may be revolved.

603,924. PIPE-HANGER. THEODOR B. GABER, Oberrollnberg, Germany. Filed Feb. 16, 1897. Serial No. 623,302. (No model.)

Claim.—1. The combination of two clamping-sections, a spike secured to the first of said sections and capable of holding the same in position, the said first section being curved and provided at one end with an outwardly-extending hook and at the other end with a notch forming an inwardly-turned projection, the second section being curved and having a recess at each end, the recesses respectively receiving the ends of the first-named section, and the hook of the said first named section engaging with the said remaining section, and a lock-plate having an opening capable of receiving the end of the first-named section which end has the projection, and the lock-plate being also capable of receiving the adjacent end of the second-named section and of engaging under the projection of the first-named section whereby to hold the two sections engaged.

2. The combination of two sections capable of embracing a pipe, the first section having a hook at one end and a projection at the other end, and the second section having a recess in each end, the recesses of said second section respectively receiving the ends of the first-named section, and the hook of the first-named section engaging the adjacent end of the second section to hold the same, and a lock-plate having an opening therein, the opening being capable of receiving the end of the first-named section which has the projection and the adjacent end of the said second section, the lock-plate being capable of engaging beneath the projection.

3. The combination of two sections capable of embracing a pipe, the sections being also capable of connection with each other at one end, the remaining end of one section having a projection, and the remaining or corresponding end of the other section having an opening through which the said projection passes, and a lock-plate capable of connection with the last-named ends of the sections and of engaging beneath the projection to hold the sections together.

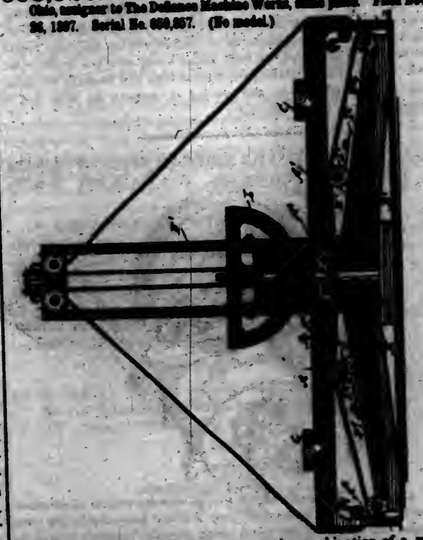
603,925. PNEUMATIC ELEVATOR. JAMES B. SHERMAN, Columbia, Ind., assignor to the Pneumatic Elevator and Weigher Company, Indianapolis, Ind. Filed Oct. 7, 1897. Serial No. 654,653. (No model.)

Claim.—1. The combination, in a pneumatic elevator, of a tube through which the material to be elevated is to pass, a duplex wheel-receptacle at the lower end of said tube arranged to receive two revolving devices, a delivery-wheel mounted in the lower wheel-receptacle and adapted to throw the material up said tube, and a blast-fan mounted in the upper wheel-receptacle and communicating with said tube above the point where the material is discharged therefrom.

2. The combination of a tube, a "boot" containing two wheel-receptacles, a material throwing or delivery wheel in one receptacle, said wheel consisting of suitable supporting sides and throwing-wings between said sides and formed with an open center into which the material may pass and thus be admitted centrally to said wheel, and a blast-fan located in the other wheel-receptacle and adapted to supply an additional current of air and accelerate the movement of the material being elevated.

3. The combination, of an elevating-tube, a boot containing the elevating and blast wheels, a spout for loading the material to the elevating-wheel, a gate to said spout for controlling the flow of material, a wind-gate mounted in the elevating-tube, and a connection between said wind-gate and said spout-gate, whereby the flow of material is governed in proportion to the speed of the blast apparatus and force of the blast, substantially as set forth.

4. The combination, in an elevator, of the blast apparatus, including the boot, the delivery-wheel, and the blast fan, an elevating-spout, a flaring hood on the upper end of said spout, an inverted cone within said flaring head, and a deflector secured to said flaring head and curved over the edges of said inverted cone, substantially as set forth.



5. The combination in a grain-elevator of the blast-fan, the tube leading from the fan-casing constituting the elevating-spout, a flaring hood on the upper end of said spout, an inverted cone within said hood, an annular opening being left between the two, a deflector extending above said opening and over and down into said inverted cone, the floor-plate and discharge-spout leading therefrom through the side of said inverted cone, substantially as set forth.

6. The combination in an elevator, of the blast apparatus, the elevator-tube provided with a flaring upper end, an inverted cone within said flaring end, there being a discharge-space between the two, and a deflector covering said space and curved down within said inverted cone, said deflector being mounted to be adjusted to extend different distances within said cone, substantially as set forth.

7. The combination, in an elevating and weighing apparatus, of the elevator-tube, the blast apparatus connecting with the lower part of said tube, a separating-head on the upper end of said tube, a weigher the receptacle whereof is positioned adjacent to said separating-head, and a tube whereby the heavier material is conveyed from said separating-head to said weigher-receptacle, the upper portion of said tube being perforated or reticulated, substantially as and for the purposes set forth.

8. The combination, in an elevating and weighing apparatus, of a pneumatic elevator-tube, a boot at the lower end thereof containing a grain-delivering and blast apparatus, a separating-head at the upper end thereof whereby the grain is separated from the dust and air, a weigher positioned suitably in respect to said separating-head, and a conveyer-spout for conveying the separated grain from said separating-head to the receptacle of said weigher, the upper portion of which is provided with air-escape openings, said several parts being arranged and operating substantially as set forth.

603,926. BENDING-MACHINE. CHARLES SEYMOUR, Defiance, Ohio, assignor to The Defiance Machine Works, same place. Filed Nov. 26, 1897. Serial No. 659,857. (No model.)

Claim.—1. In a bending apparatus the combination of a main frame or bed, standards mounted thereon, a form carried on the standards, two bending-arms located below the form, means in connection with the outer ends of said arms to swing the same, a master-strap extending from one arm to the other, a rope run below the arms, pulleys on which the rope is carried, a spring respectively in connection with the ends of the rope and serving to hold the rope taut, the rope forming a support for the inner ends of the arms and serving to thrust the arms toward the form.

2. In a bending apparatus the combination of a frame, a form supported on the frame, two bending-arms mounted below the form, a master-strap extending from one arm to the other, means for swinging the arms, a rope run beneath the arms, pulleys over which the rope is rolled, the pulleys being carried by the frame, and springs serving to draw the rope taut beneath the arms, the rope forming a yielding support for the inner ends of the arms and serving to thrust the arms toward the form.

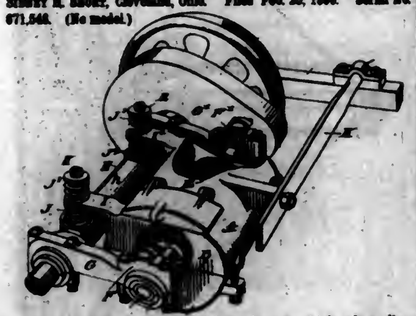
3. In a bending apparatus the combination with a frame, of a form, two bending-arms mounted below the form, means for swinging

said arms, and a yieldingly-sustained rope run below the arms and serving to support the inner ends thereof and to thrust the arms toward the form.

4. In a bending apparatus the combination of a form, two bending-arms in line with each other and having contiguous ends, means for swinging the arms, and a yieldingly-sustained rope run beneath the arms and forming a support for the inner ends thereof, and serving to thrust the arms toward the form.

5. In a bending apparatus the combination with a frame, of two bending-arms mounted thereon, the arms being in line with each other and having contiguous inner ends, means for swinging the arms, and a yieldingly-sustained rope run beneath the inner ends of the arms and serving to yieldingly support the same.

6. In a bending apparatus the combination of a frame, two bending-arms in line with each other and having their inner ends contiguous, means attached to the outer end of each arm by which to move the same, and a yieldingly-sustained rope run beneath the inner ends of the arms and serving to yieldingly support the arms.



7. In a bending apparatus the combination of a form, two bending-arms in line with each other, and having their inner ends contiguous, a master-strap running along the arms and connected with each means attached to the outer end of each arm, by which to move the arms, and a yieldingly-sustained rope run in proximity with the inner ends of the arms and serving to support the arms and to thrust the arms toward the form.

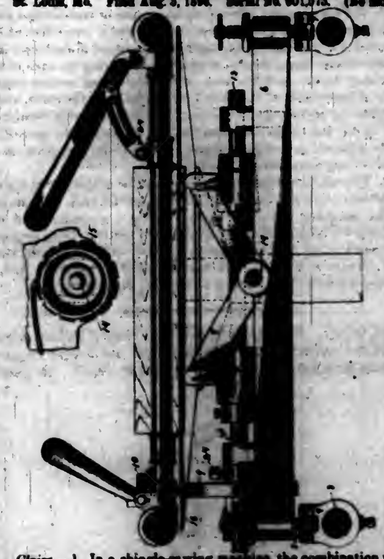
8. In a bending apparatus the combination of a form, bending devices mounted adjacent to the form and coacting therewith, and a yieldingly-sustained rope serving to support said bending devices and to thrust them toward the form.

9. In a bending apparatus the combination of bending devices, and a rope yieldingly sustained in proximity with the bending devices and serving to support the same.

10. In a bending apparatus the combination with a frame having standards thereon, of a form held by the standards, two bending-arms in line with each other and having their inner ends contiguous, the bending-arms being mounted on the frame below the form, means for lifting the bending-arms, such means being attached to the outer ends thereof, and a yieldingly-sustained rope run beneath the inner ends of the bending-arms and serving to support the same and to thrust the arms toward the form.

603,927. MEANS FOR SUSPENDING MOTORS ON VEHICLES. HENRY H. SWOBE, Cleveland, Ohio. Filed Feb. 25, 1898. Serial No. 671,548. (No model.)

Claim.—1. The combination with a wheeled vehicle of an alinement-frame mounted on a driven axle, a motor journaled in the arms thereof, the weight of the motor being partially borne by springs interposed between the same and said alinement-frame, and by a rigid support extending to the truck-frame and inelastically supported thereby, substantially as described.



2. The combination with a wheeled vehicle, of an alinement-frame mounted on a driven axle, a motor journaled therein having projections, and partially supported by springs interposed between said projections and said frame, and a rigid support connecting said motor with the truck-frame, substantially as described.

3. The combination with a wheeled vehicle of an alinement-frame mounted on the driven axle, an electric motor journaled in the arms of said frame, projections from the field-magnet of said motor engaging with springs bearing on said alinement-frame, and a rigid support for the part of the motor remote from said projections, substantially as described.

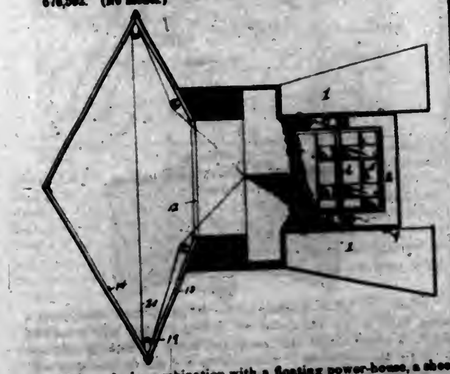
4. The combination with a wheeled vehicle of an alinement-frame, a motor journaled therein and free to turn relatively thereto, springs interposed between a portion of said motor and said frame, a rigid cross-bar to which the upper part of said motor is directly connected, substantially as described.

5. The combination with a wheeled vehicle of an alinement-frame, a motor journaled therein, springs between a portion of said motor and said frame, a cross-bar to which the upper portion of said motor is rigidly connected, and bearings in which said cross-bar is mounted, so as to be free to turn, substantially as described.

608,928. SHINGLE-SAWING MACHINE. GEORGE F. STREHLAU, St. Louis, Mo. Filed Aug. 3, 1896. Serial No. 601,573. (No model.)

Claim.—1. In a shingle-sawing machine, the combination with a suitable frame, of the slidable carriage mounted thereon, a saw, a tilt-table, mechanism for tilting the table, means for operating said mechanism, and a laterally-extending handle on said carriage immovable in the direction of movement of the carriage, said handle being movable at an angle to the line of movement of the carriage, and the handle thus moved operating to throw the means for operating the table-tilting mechanism into operative or inoperative position.

2. In a shingle-machine, the combination with a suitable frame, of a carriage mounted thereon, a tilt-table, a supporting-frame therefor, a shaft provided with fixed longitudinally-inclined cams cooperating with said tilt-table when said shaft is rotated, means for rotating said shaft upon the movement of the carriage, and suitable devices for adjusting said shaft and its cams relative to the tilt-table; substantially as described.

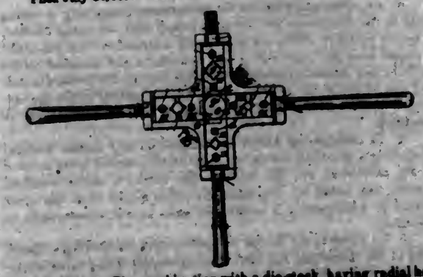


3. In a shingle-machine, the combination with a suitable frame, of a sliding carriage mounted thereon, a tilt-table, longitudinally-inclined cams for cooperating with said tilt-table, a shaft on which said cams are fixed, means for adjusting said shaft and its fixed cams relative to said tilt-table and for locking said shaft in its adjusted position, a star-wheel mounted on said shaft and provided with devices for locking the same to said shaft and preventing independent rotary movement on the shaft, a pawl on the carriage for operating said star-wheel, and a pivoted handle on the carriage having connections with said star-wheel pawl; substantially as described.

4. In a shingle-machine, the combination with a suitable frame, of a carriage mounted thereon, a tilt-table, a supporting-frame therefor, a shaft mounted in said supporting-frame and provided with longitudinally-inclined fixed cams cooperating with said tilt-table when said shaft is rotated, a star-wheel arranged on said shaft for rotating the same upon the movement of the carriage, suitable devices for lengthwise adjusting said shaft and its cams relative to the tilt-table, without destroying the register between the star-wheel and its operating medium, and means for throwing said operating medium into or out of operative relation to the star-wheel at will; substantially as described.

5. In a shingle-machine, the combination with a suitable frame of a carriage mounted thereon, a tilt-table, a supporting-frame therefor, longitudinally-inclined ways on which said supporting-frame is mounted, means for moving said frame and its carried tilt-table, along said cams to effect a vertical adjustment of said moving parts, a shaft mounted in said supporting-frame and provided with longitudinally-disposed fixed cams cooperating with said tilt-table when said shaft is rotated, a star-wheel arranged on said shaft for rotating the same upon the movement of the carriage, suitable devices for lengthwise adjusting said shaft and its cams relative to the tilt-table without destroying the register between the star-wheel and its operating medium, and means for throwing said operating medium into or out of operative relation to the star-wheel at will; substantially as described.

6. In a shingle-sawing machine, the combination with a suitable frame, of a movable carriage mounted thereon, a saw, a tilt-table, means for tilting said table, a frame in which said tilt-table is mounted, screws arranged at the corners of said frame for adjusting said frame and its carried tilt-table vertically, means cooperating with said screws for vertically raising or lowering said frame and its carried tilt-table, a lever located outside the main framing of the machine for actuating said raising or lowering mechanism, and means for adjusting a connection between said lever and said tilt-frame, substantially as described.



608,929. FLOATING POWER-HOUSE. JAMES SPICER, Williamsport, Pa. Filed Nov. 14, 1895. Renewed Apr. 5, 1898. Serial No. 676,502. (No model.)

Claim.—1. In combination with a floating power-house, a sheer consisting of a supporting-beam, formed of duplicate members, suitably-connected arms hinged to the supporting-beam, connecting-rails 14, hinged together and to the arms, downwardly-extending strips secured between the members of the arms, suitable pulleys and a rope for varying the width of the sheer, as and for the purpose described.

2. In combination with a floating power-house, a frame in front thereof, arms hinged to the frame and having depending partitions extending into the water and an inverted-V-shaped screen hinged or pivoted to the arms and floating on the surface of the water, pulleys secured to the arms and screen and a rope for adjusting the arms as and for the purpose described.

608,930. DIE-STOCK. WILLIAM H. SWEITZER, Danville, Ill. Filed July 31, 1897. Serial No. 646,021. (No model.)

Claim.—1. The combination with a die-stock, having radial hexagonal die-bars, and radial recesses for dies in opposite faces of the stock, of a plurality of thread-cutting dies engaging the recesses of the stock, a central die occupying the recesses on one side and the other dies being disposed about the center and in the recesses on the other side of the stock, each die comprising a fixed section and a movable section, and a set screw bolt for adjusting each movable die-section, said bolts each having a threaded engagement with the die-stock, as specified.

2. The combination, with a die-stock, comprising a stock-body having four spaced blades longitudinally channeled to receive thread-cutting dies, and four pairs of thread-cutting dies in said channels, one die-section of each pair being longitudinally slotted and the other die-section thereof perforated, of set-screw bolts engaging in the said holes and slots and screwing into tapped holes in the die-stock, said stock having an orifice opposite the cutting ends of each pair of dies, and set-screw bolts screwed through tapped ears on the stock-body and pressing on the outer slotted section of each pair of dies, as specified.

3. The combination with a die-stock channeled on one side to produce four radial channels or recesses therein, and on the opposite side to receive one pair of thread-cutting dies which lie between the four radial recesses, of four pairs of thread-cutting dies in the radial recesses, the die-stock being circularly apertured opposite the cutting edges of each pair of dies, and means for adjustably holding all the dies on the stock, as specified.

4. The combination with a die-stock having on one side thereof four die-receiving recesses alined in pairs, each pair of recesses being at right angles with the other pair, said stock being also provided with a single die-receiving recess on the opposite face thereof, which recess lies diagonally between the pairs of recesses in the opposite face of the die-stock, of five thread-cutting dies each comprising a fixed die-section and a movable die-section, means to hold the pairs of die-sections in respective recesses, and a set-screw bolt for each pair of dies projecting through a tapped ear on the die-stock, and adapted to press upon the movable die it is opposite, as specified.

5. A die-stock, comprising a central plate or body having a central pipe-receiving hole passing therethrough and a series of other pipe-receiving holes disposed about the same, thread-cutting dies and means for securing them to the central body to register with said holes, the central die being upon one side of the body and the other dies being upon the opposite side thereof.

6. A die-stock, comprising a central plate or body having a central pipe-receiving hole passing therethrough and a series of other pipe-receiving holes disposed about the same, recesses in the face thereof adapted to receive thread-cutting dies and hold them in register with said holes, and dies in said grooves, the central die being upon one side of the body and the other dies being upon the opposite side thereof.

7. A die-stock, comprising a central plate or body having a central pipe-receiving hole passing therethrough, and a series of other pipe-receiving holes disposed about the same, recesses in the face thereof adapted to receive thread-cutting dies and hold them in register with said holes, dies in said grooves formed of pleral members and set-screws mounted in the recess-walls and adjusting said die members.

8. A die-stock, comprising a central body having a central pipe-receiving hole passing therethrough, and a series of other pipe-receiving holes parallel therein and disposed about the same, recesses in the face thereof adapted to receive thread cutting dies and hold them in register with said holes, dies in said grooves formed of pleral members, the central die being upon one side of the body and the other dies being upon the opposite side thereof and set-screws mounted in the recess-walls and adjusting said die members.

608,931. RIPPING ATTACHMENT FOR SEWING-MACHINES. MAURICE TALBE and GEORGE H. CRAFT, Geneseo, Ill. Filed Nov. 26, 1897. Serial No. 659,031. (No model.)

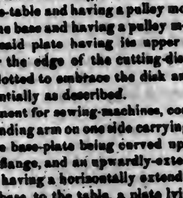
Claim.—1. A ripping attachment for sewing-machines, comprising a base-plate separate from and attachable to the sewing-machine table, and having two pulleys supported therefrom and adapted to receive the sewing-machine belt between them, and a ripping-disk connected with one of said pulleys, substantially as described.

2. A ripping attachment for sewing-machines, comprising a base-plate separate from and attachable to the machine-table, and having two pulleys supported therefrom at different elevations and adapted to receive the belt between them by distorting the belt, one of said pulleys being movable horizontally, and a cutting-disk connected to one of the pulleys, substantially as described.

3. A ripping attachment for sewing-machines, comprising a base-plate separate from and attachable to the machine-table and having a pulley mounted thereon, a plate adjustable horizontally upon the base-plate and having a pulley mounted thereon above the other pulley, and a cutting-disk connected to one of the pulleys, substantially as described.

4. A ripping attachment for sewing-machines, comprising a base attachable to the machine-table and having a pulley mounted thereon, a plate adjustable horizontally upon the base and having a pulley mounted thereon above the other pulley, said plate having its upper portion curved over to form a shield for the edge of the cutting-disk, and a cutting-disk mounted upon the shaft of the second pulley, substantially as described.

5. A ripping attachment for sewing-machines, comprising a base attachable to the machine-table and having a pulley mounted thereon, a plate adjustable upon the base and having a pulley mounted thereon above the other pulley, said plate having its upper portion curved over to form a shield for the edge of the cutting-disk, and its front edge bent laterally and slotted to embrace the disk and form a work support or guide, substantially as described.

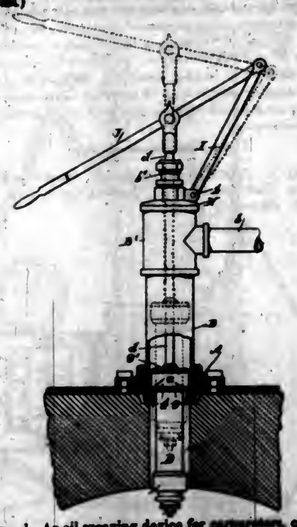


6. A ripping attachment for sewing-machines, comprising a base having an upwardly-extending arm on one side carrying a roller thereon, the same edge of the base-plate being curved upwardly and inwardly to form a guide-flange, and an upwardly-extending flange or web upon the other side having a horizontally extending slot therein, means for securing the base to the table, a plate lying alongside of the slotted web of the base and having a base flange engaging beneath the guide-flange of the base, a pulley and connected cutting-disk journaled on said plate above the other pulley, said plate also having its upper edge rolled over the edge of the disk to form a guard therefor, and a recess at one side exposing a section of the disk, substantially as described.

7. A ripping attachment for sewing-machines, comprising a base having an upwardly-extending arm on one side carrying a roller, the same edge of the base-plate being curved upwardly and inwardly to form a guide-flange, and an upwardly-extending flange or web upon the other side having a horizontally-extending slot therein, means for securing the base to the table, a plate lying alongside of the slotted web of the base and having a base-flange engaging beneath the guide-flange of the base and a leg engaging the machine-table beyond the belt, a pulley and connected cutting-disk journaled on said plate above the other pulley, said plate having a recess at one side exposing a section of the disk, and a bolt passing through the slot in the base-plate and entering the sliding plate whereby the two may be adjusted, substantially as described.

8. A ripping attachment for sewing-machines, comprising a base having an upwardly-extending arm on one side carrying a roller, said base being bent upwardly and inwardly to form a guide on the same side of the base, and an upwardly-extending flange or web upon the other side having a horizontally-extending slot therein, a clamping-arm extending downward from said base and adapted to pass through the bolt-hole in the machine-table, a plate lying alongside of the slotted web of the base and having a base-flange engaging beneath the guide-flange of the base, and a leg engaging the machine-table beyond the belt, a bolt passing through the slot in the base-plate and into the sliding plate, a pulley and connected cutting-disk journaled in said plate above the other pulley, said plate also having its upper edge rolled over the edge of the disk to form a guard therefor, a recess at one side exposing a section of the disk, and a side extending flange at the lower part of the said recess, said flange being slotted to embrace the disk and forming a work guide or support, substantially as described.

9. The combination in a ripping device, of a base-plate, two pulleys mounted to rotate thereon and adapted to receive a belt between them, and a cutting-disk connected with one of said pulleys, with a sewing-machine having a table-top, means for securing the base-plate thereto with its pulleys in line with the belt, the belt-pulleys, and their operating means, substantially as described.



603,932. TRUSS-PAD. SMITH TUCKER, Medina, N. Y., assignor of one-half to George Arnold, same place. Filed Sept. 11, 1897. Serial No. 651,336. (No model.)

Claim.—1. A tram-pad formed of rigid material, and having one face provided with a rib run around the edge thereof, and with parallel ribs located in the space inclosed by the edge rib, the lower ends of the parallel ribs abutting against the edge rib, and the upper ends of the parallel ribs being run through the edge rib to the very edge of the pad.

2. A tram-pad formed of rigid material, provided with an edge rib, and with parallel ribs abutting against the edge rib, the pad having openings therein, the openings extending from the spaces between the parallel ribs.

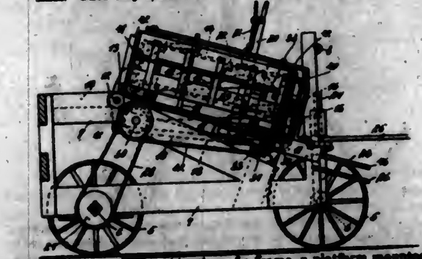
603,988. SPRAYING DEVICE FOR CARBURETERS. GEORGE H. WEBER, New York, N. Y. Filed Oct. 28, 1897. Serial No. 656,162. (No model.)

Claim.—1. An oil-spraying device for carburetors, comprising a casing fixed to the carburetor and having a supply-pipe connected thereto, a nozzle within said casing, and means for entering said nozzle within the carburetor or withdrawing it within the casing, at will, substantially as described.

2. An oil-spraying device for carburetors, comprising a casing fixed to the carburetor and having a supply-pipe connected thereto, a hollow cylinder within said casing and adapted to close the same, a nozzle upon the inner end of said cylinder, and means for reciprocating said cylinder within the casing, at will, substantially as described.

3. An oil-spraying device for carburetors, comprising a casing fixed to the carburetor and having an outwardly-facing valve-seat within the same and an oil-supply connection, a hollow cylinder within said casing, having a nozzle upon its inner end, and a head or projecting ring upon its outer end having a valve-surface adapted to engage the said valve-seat, and means for reciprocating the cylinder to seat the valve and project the nozzle into the carburetor or to withdraw the cylinder into the casing, at will, substantially as described.

4. An oil-spraying device for carburetors, comprising a casing fixed to the carburetor and having a supply-pipe connected thereto, a hollow cylinder within the said casing adapted to close the same, a nozzle upon the inner end of said cylinder, a rod attached to the cylinder and extending outside the casing, and a lever pivoted to said rod and by which the cylinder-nozzle may be entered within the carburetor or be withdrawn into the casing, as desired, substantially as described.



5. An oil-spraying device for carburetors and similar devices, comprising a telescopic casing, the outer section thereof being secured to the carburetor and the inner section having a nozzle attached thereto, and means for projecting the inner section from the outer section or withdrawing it within the same at will, substantially as described.

6. An oil-spraying device for carburetors, comprising a casing fixed to the carburetor and having an outwardly-facing valve within the same, and an oil-supply connection, a hollow cylinder within said casing, having a nozzle upon its inner end and a perforated cap upon its outer end, the inner edge of said cap forming a valve to engage the seat, a rod attached to said cap, a stuffing-box for the exit of said rod, and means for engaging said rod and moving the cylinder, to project the cylinder into the carburetor or withdraw it into the casing, substantially as described.

7. A nozzle for carburetors, comprising two telescopic members, a hollow cap secured to the end of one member, a perforated disk or partition extending across the cap, a stem supported from said disk, and a cone upon said stem and entering the hole in the cap, substantially as described.

8. An oil-spraying device for carburetors, comprising a casing fixed to the carburetor and having a supply-pipe connected thereto, a hollow cylinder within this casing adapted to close the inner end thereof, a nozzle upon the inner end of said cylinder, a rod attached to the cylinder and extending outside the casing, a lever pivoted to the outer end of said rod, and a link pivoted to said lever as a fulcrum, whereby the cylinder and nozzle may be entered within the carburetor or withdrawn into the casing, substantially as described.

603,934. CORN-HEADER. WILLIAM A. WILSON, Centropolis, Kans. Filed May 3, 1897. Serial No. 635,673. (No model.)

Claim.—1. The combination of a frame, a platform mounted to swing thereon, a lever fulcrumed on the axis of said platform and having its upper portion extended forwardly beyond said axis, a standard fixed to the platform and having sliding connection with the upper end of the lever, a link pivoted to the lower end of the lever and extending forwardly, a hand-lever mounted on the frame and connected with the link, and a bell-crank lever also mounted on the frame and connected with the link, the bell-crank lever being within reach of the driver's foot.

2. The combination with a frame, of a platform mounted to swing thereon, a standard fixed to the platform, a lever fulcrumed on the axis of the platform and having sliding connection with the standard at the upper end of the lever, a link pivoted to the lower end of the lever and extending forwardly, and means in connection with the forward end of the link, whereby to reciprocate the same.

603,935. TIME-LOCK. CORNELIUS M. BALL, Oliveilla, Ky. Filed July 29, 1896. Serial No. 600,962. (No model.)

Claim.—1. In a time-lock of the character described the combination of the main bolt, a time mechanism connected therewith for operating the same at a predetermined time, and a coöperating locking-latch, and means for operating the same, substantially as specified.

2. In a time-lock of the character described, the combination with the main bolt, having a shoulder and a stem at the rear or outer end and coiled spring encircling said stem, of the locking-drum, the spindle on which it is mounted the wrist-plate the pin secured thereto, the toothed slide, with which said pin is adapted to engage and the notched leg with which said drum is adapted to engage and a clock mechanism for retracting said bolt, substantially as specified.

3. In a time-lock of the character described, the combination with the main bolt having a shoulder and a stem at the rear or inner end, the coiled spring encircling said stem, the detent near the front end of said bolt, the locking-drum the wrist-plate and pins, the toothed slide having a notched leg and an operating-knob and the pivoted dog engaging with the detent of the bolt and provided with a projection, of the slide having a series of notches, the front ones of which are adapted to be engaged by a connection from a clock-movement and the rear ones by one of the pins of said wrist-plate, and the clock mechanism for operating said main bolt and said last-mentioned slide, substantially as specified.

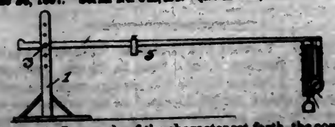
4. In a time mechanism of the character described, the combination with the main bolt, having a shoulder and stem at the inner end, a coiled spring encircling said stem and a clock mechanism for retracting said bolt, of the toothed latch-bolt, the pinion engaging therewith and its operating-spindle the detent on said latch-bolt and the pivoted spring-dog engaging therewith and operated by the retraction of the main bolt, substantially as specified.

5. In a time mechanism for time-locks the combination with striker-shaft, extending through the casing, the cam loosely mounted thereon, the pins connected with said cam, the swivel-bearing to which said pins are secured, the pawl carried by said cam and the ratchet-wheel secured to said shaft engaging therewith, of the sleeve loose on said shaft, the wheels formed integral therewith, the segment-wheel on said sleeve the coiled spring, the master-wheel on said striker-shaft, the trundle-shaft, the gear-pinion thereon meshing with one of the wheels of said shaft, the pinion engaging with said segment-wheel, the pinion and bevel-wheel, the shaft extending through the casing, provided with an index, the graduated segment, and the jigger-hooks for releasing the striking mechanism substantially as described.

603,936. PHOTOGRAPHIC OPAQUE NEGATIVE AND PROCESS OF PRINTING THEREFROM. HERS BOUVARD, Rockford, Ill. Filed Oct. 30, 1897. Serial No. 656,895. (Specimens.)

Claim.—1. A new process of photography, consisting in producing a negative by spreading a sensitive emulsion upon the reflecting-surface of a substantially opaque substance, exposing the prepared surface, as in a camera and causing the light to be reflected from the reflecting-surface of the negative thus produced to a sensitized surface, to produce the positive print.

2. A new process of photography, consisting in producing a negative by spreading a sensitive emulsion upon the pure-white glazed surface of a substantially opaque substance, exposing the prepared surface, as in a camera, developing and fixing the negative, and causing the light to be reflected from the white glazed surface of the negative to a sensitized surface to produce the positive prints.



3. A new process of photography consisting in producing a negative by spreading a sensitive emulsion upon the pure-white filled and glazed surface of paper, exposing the prepared surface, as in a camera, developing and fixing the negative, and causing the light to be reflected from the white glazed surface of the negative to a sensitized surface to produce the positive prints.

4. As a new article of manufacture, an opaque backing having a light-reflecting surface, having thereon a photographically-prepared film negative of an original object.

5. As a new article of manufacture, an opaque backing, having a pure-white glazed surface, having thereon a photographically-prepared film negative of an original object.

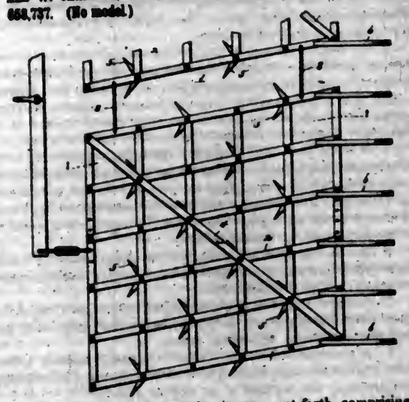
6. As a new article of manufacture an opaque backing having a pure-white filled and glazed surface, having thereon a photographically-prepared film negative of an original object.

603,937. WAGON-SCALE. ALLEN BRADLEY, Floris, Va. Filed June 26, 1897. Serial No. 642,491. (No model.)

Claim.—1. In a scale of the character set forth, the combination of a supporting-standard, a beam adjustably held by said standard and having a scale-bar depending from the outer end thereof with a dial on the lower portion thereof, and a spring-scale also depending from said beam and comprising a pointer with a spring-actuated stem having a stirrup at the lower end thereof, said stem being provided with teeth to engage the operating devices of the dial, substantially as described.

2. In a scale, the combination of a standard having a series of openings therethrough, a scale-beam adjustably mounted upon said standard and having a balance-weight thereon, a spring-scale comprising a pointer and a stirrup at the outer end of the said scale-beam, the said pointer and stirrup being connected to each other, and a scale-bar over which said pointer has movement and having at the lower end thereof a dial, of a rotary scale adapted to be actuated by the movement of the connection between the pointer and the stirrup, substantially as described.

603,938. PORTABLE FENCE. WILLIS J. BROOK, Tamaha, Ind. Ter. Filed Aug. 28, 1897. Serial No. 649,494. (No model.)



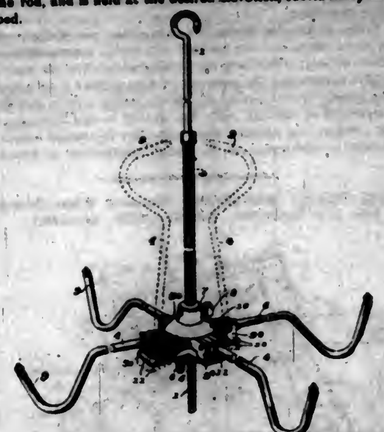
Claim.—1. A fence-panel composed of flat metal stringers provided at their ends with post-sockets, stays secured to said stringers to hold them in fixed relative position, and panel-wires secured to the stays, substantially as shown and described.

2. In a fence-panel, the combination with a pair of stringers, provided with serrated edges and with terminal post-sockets, of vertical stays connecting the stringers, clips upon the stays, and panel-wires secured to the clips, substantially as described.

3. In a fence-panel, the combination with a pair of stringers having serrated edges and provided with terminal post-sockets, of vertical stays secured to the stringers and having their lower ends bent at right angles, clips cut from the stays and panel-wires secured to said clips, substantially as described.

4. A fence panel consisting of flat metal stringers, vertical stays secured thereto to hold them in relative position, and panel-wires secured to said stays, the stays having their lower ends bent at right angles and the bent portions of adjacent stays extending laterally in opposite directions.

603,939. APPARATUS FOR EXTERMINATING WEEDS. RICHARD W. CAMPBELL, Warren, S. D. Filed Nov. 16, 1897. Serial No. 658,737. (No model.)



Claim.—An apparatus for the purpose set forth, comprising a frame with a series of straight teeth, alternately arranged pairs of forwardly-extending oblique-pointed forks, and rear hinged curved spring-teeth, substantially as described.

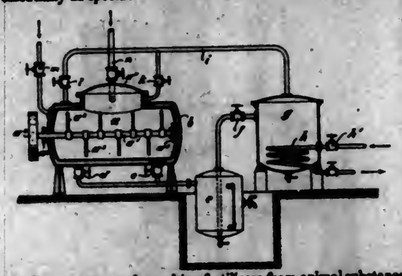
603,940. HANGER FOR HARNESS. CHARLES S. CARRIE, Hinsdale, N. H. Filed Sept. 9, 1897. Serial No. 651,060. (No model.)

Claim.—1. A harness-hanger, comprising a suspension-rod, a vertically-movable sleeve slidingly mounted on the rod and provided at its bottom with ears, harness-supporting arms pivoted to the ears and adapted to swing upward in folding, an adjustable collar engaging the rod and located beneath and supporting the sleeve, whereby the sleeve and the harness-supporting arms may be readily rotated on the rod, and a fastening device mounted on the sliding sleeve and adapted to engage the rod for locking the sleeve against rotary movement, when it is desired to hold the same rigid with the rod, substantially as described.

2. A harness-hanger, comprising a suspension-rod, a vertically-movable sleeve slidingly mounted thereon and having its lower portion enlarged, perforated ears arranged in pairs and projecting from the lower portion of the sleeve, harness-supporting arms pivoted between the perforated ears and adapted to swing upward in folding, a flange extending around the lower portion of the sleeve, located above the ears and arranged to be engaged by the inner ends of the harness-supporting arms, to hold the latter in a horizontal position, and an adjustable collar secured to the rod and located below and supporting the sleeve, whereby the latter is permitted to rotate freely on the rod, and is held at the desired elevation, substantially as described.

3. A harness-hanger, comprising a suspension-rod, a vertically-movable sleeve mounted on the rod and provided at its bottom with ears, harness-supporting arms pivoted to the ears and adapted to swing upward in folding, an adjustable collar secured to the rod and located beneath and supporting the adjustable sleeve, whereby the latter is held at the desired adjustment, and is permitted to rotate freely on the rod, and a horizontal spring arranged on the rod between the lower end of the sleeve and the collar, and provided with arms corresponding to the ears and disposed beneath the same in position to be engaged by the lower ends of the harness-supporting arms when the latter are swung upward to retain the same in their folded position, substantially as described.

603,941. TIRE-VALVE. AARON S. GARFURKEY, Birmingham, England. Filed Oct. 4, 1897. Serial No. 654,033. (No model.) Patented in England July 20, 1897, No. 17,702.



Claim.—1. The combination with a pneumatic tire, of a valve therefor, comprising a hollow stem having a head at one end located within the tire, an elastic dome or chamber inclosing said head but normally lying out of contact with the face thereof to provide an intervening air-space, and having a contracted mouth which surrounds the hollow stem adjacent to the said head slits or incisions in the elastic dome or chamber, the lips of said slits or incisions being normally held closed by the back pressure of air within the tire and opened by distending the dome, and clamping-nuts arranged upon the stem and adapted to clamp the parts together and to the tire, substantially as described.

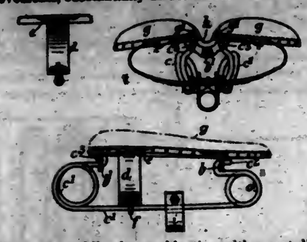
2. The combination with a pneumatic tire, of a valve therefor comprising a hollow exteriorly-threaded stem having a head at one end located within the tire, an elastic dome or chamber inclosing said head and having a contracted mouth located between the head and tire, said dome or chamber being provided with slits or incisions which are opened by the act of inflating the tire and the lips of said incisions normally held closed by the elasticity of the walls of said chamber and by the back pressure of air within the tire, alternately-arranged nuts and washers screwed upon the hollow stem to clamp the valve to the tire, a screw-cap for the end of the hollow stem, a deflating-tube having openings in its opposite ends and adapted to pass up into the hollow stem to distend the elastic dome for the purpose specified, and a chain connection between the said screw-cap and deflating-tube.

603,942. APPARATUS FOR MAKING FERTILIZERS. BRUNO CLARENBACH, Berlin, Germany. Filed Feb. 7, 1896. Serial No. 579,204. (No model.)

Claim.—1. The combination, in an apparatus for the utilization of animal-cadavers or parts thereof, of the digester *c*, collector *e* and evaporator *g* with a pipe and valve connection for continually conducting the extracted liquids and the water condensed in the steam-jacket *b* from the first vessel or digester to the second vessel *e* and the vapors from the third vessel *g* back to the jacket of the digester, all essentially as specified.

2. In an apparatus for making fertilizers from animal substances, the combination with the digester having a valve-controlled steam-inlet thereto, of a collector, a valve-controlled pipe or conduit leading from the interior of said digester into said collector, a valve-controlled branch pipe or conduit leading from the steam-space around said digester into said collector, an evaporating vessel in connection with the interior of said collector through a valve-controlled pipe or conduit, and a pipe or conduit leading from said evaporator to the interior of said digester and also communicating with said steam-space, and valves for controlling said several pipes or conduits, substantially as described.

3. The combination in an apparatus for the utilization of animal-cadavers or parts thereof, of the digester having a steam-jacket, the collector arranged below the plane of the digester, a pipe or conduit connecting said collector with the interior of said digester and with said steam-jacket, an evaporating vessel located above the plane of said collector, a pipe or conduit leading from the interior of said collector near the bottom thereof into said evaporator, a heating-coil within the latter, having inlet and outlet pipe connections with a valve in each for controlling the same, a pipe or conduit leading from said evaporating-vessel to the digester-jacket and also to the interior of the digester, a valve-controlled steam-inlet pipe communicating with the interior of the digester, and valves controlling the pipes or conduits connecting the digester and collector and the collector and evaporator, substantially as described.



4. In an apparatus for treating animal-cadavers or parts thereof for the purpose of producing therefrom dry manure in powderous condition, a digester having a steam-jacket, an agitating device or stirrer within the digester, a collecting vessel for receiving the fluid matter and water from said digester, pipes or conduits leading from the interior of said digester and said steam-jacket into said collector, a valved pipe or conduit connecting said collector and evaporating vessel, conduits or pipes leading from the evaporator into the interior of said digester and said steam-jacket, and valves for controlling the flow of fluid matter and water from said digester and steam-jacket into said collector, and from the latter into said evaporator, and the vapors from the evaporator into said digester and steam-jacket, substantially as described.

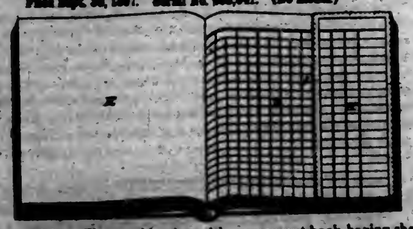
5. An apparatus for treating animal-cadavers or parts thereof for the purpose of producing therefrom dried fertilizing material, comprising a digester having a steam-jacket and a steam-inlet pipe communicating with the interior thereof, a collecting vessel arranged below the plane of said digester, valve-controlled pipes or conduits leading from the interior of the digester and the steam-jacket thereof into said collector, an evaporating vessel, a valve-controlled pipe or conduit leading from the collector into said evaporator, pipes or conduits connecting the evaporator with the interior of the digester and its steam-jacket, and valves for controlling the inlets to the latter, the whole constituting a perfectly-closed fluid and vapor circulating system adapted to prevent the escape of steam or vapors and offensive odors and any waste of cooling-water, substantially as described.

603,943. CYCLE-SADDLE. WALTER GLYDDEN, London, England. Filed Jan. 6, 1897. Serial No. 618,963. (No model.) Patented in England Sept. 11, 1896, No. 22,162.

Claim.—1. A cycle-saddle divided longitudinally into two similar and equal parts or halves pivotally connected together and supported by longitudinal springs, and by a transverse spring common to both parts or halves, substantially as and for the purposes described.

2. In a cycle-saddle, the combination with a seat divided longitudinally into two equal parts or halves, of a spring arranged longitudinally under each said part or half and pivotally connected near the peak and rear thereto, and a transverse spring arranged beneath said parts or halves and adapted to support the same in their up or down movements, substantially as described.

3. In a cycle-saddle, the combination with a seat divided longitudinally into equal parts or halves, of a spring arranged longitudinally under each said part or half and pivotally connected near the peak and rear thereto, a transverse spring arranged beneath said parts or halves to support them in their movements, and means for securing the said springs together to cause them to work in unison, substantially as described.



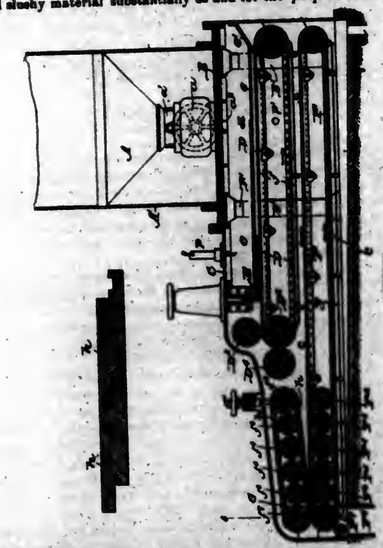
4. In a peaked cycle-saddle, the combination of two independent parts or halves, means for connecting the same, longitudinal springs to which said parts or halves are pivotally connected near their inner or adjacent edges, and a transverse spring for permitting said parts to move up or down so as to accommodate themselves to the movements of the rider, substantially as described.

5. In a cycle-saddle, the combination of two independent parts or halves, means for connecting the same, longitudinal springs to which said parts or halves are pivotally connected near their inner or adjacent edges, a transverse spring for permitting said parts to move up or down so as to accommodate themselves to the movements of the rider, and a flexible web attached along its edges to the said saddle parts or halves, and having its middle portion normally lying between and depending below the saddle parts to provide for sufficient play of the latter, substantially as described.

6. In a peaked cycle-saddle having a seat divided longitudinally into equal parts or halves and hinged together by suitable lugs or arms secured to said halves, the combination therewith of longitudinal springs pivotally connected to each of said parts and terminating in hooks at front and rear adapted to engage in holes formed in the lugs or arms of the pivotal or hinged connections of the saddle parts or halves, substantially as described.

7. In a peaked cycle-saddle, the combination of two equal and similar parts or halves provided with hinges for securing the same together, longitudinal springs pivotally connected to said parts or halves near their inner or adjacent edges, a transverse spring for supporting the said parts or halves in their up and down movements, and means for securing the extremities of the transverse spring to the halves of the saddle, substantially as described.

603,944. LEDGER-INDEX. WILLIAM M. DALY, Philadelphia, Pa. Filed Sept. 20, 1897. Serial No. 652,041. (No model.)



Claim.—The combination with an account-book having sheets projecting beyond the edges of the leaves of the book, of the retaining-frames secured to said extended sheets, and the slates adapted to slide within and be retained in position by said frames, substantially as described.

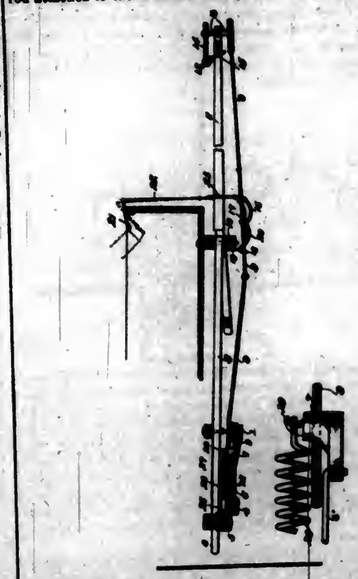
603,945. PROCESS OF AND APPARATUS FOR CONTINUOUSLY FILTERING AND PRESSING GARBAGE. CHARLES BOSSERTH, Philadelphia, Pa. Filed Oct. 21, 1897. Serial No. 655,522. (No model.)

Claim.—1. The process of continuously filtering the liquids from the solids, in the treatment of slushy garbage materials, which consists in distributing the slushy material in a layer upon a traveling

diaphragm, and applying a hot gaseous pressure to the upper side of the layer of slushy material while it is in transit substantially as and for the purpose described.

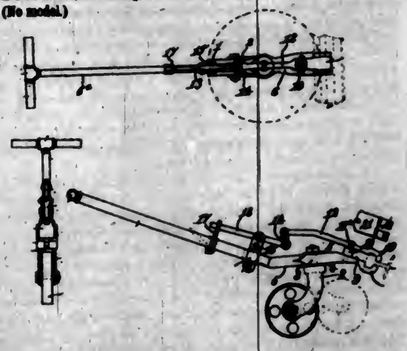
2. An apparatus for continuously filtering garbage, comprising a hermetically-closed casing, an endless traveling belt having interstices through it, means for closing the edges of said belt tightly against the sides of the casing to retain a gaseous pressure above the belt when covered with slushy materials, and means for introducing and maintaining a cushion of gaseous medium above said belt to continuously express and filter out the liquids during the passage of the said slushy material substantially as and for the purpose described.

3. An apparatus for continuously filtering and pressing slushy material comprising a gas or steam tight casing, extending horizontally and having a plate B on its upper side a digester mounted on the top of the same and having a valved communication therewith, an endless metal slatted belt, and means for closing its edges tightly against the sides of the casing substantially as and for the purpose described.



4. A filtering and pressing device for slushy materials, comprising a horizontal and pervious filter-belt having a fibrous covering and inclosing at one end a series of parallel rollers arranged horizontally, a corresponding series of parallel rollers arranged above the same and surrounded by an endless metal slatted belt, constructed with water-tight joints to prevent the upward penetration of liquids therethrough a frame carrying said upper set of rollers, pivoted at one end and made adjustable at the other, substantially as and for the purpose described.

5. A filtering and pressing device for slushy materials, comprising a casing, an endless filtering-belt, and means for closing its edges against the sides of the casing, crushing-rolls at the end of the belt, a subjacent belt extending under and beyond the first-named belt and having a fibrous covering, and a series of parallel rollers at one end and an adjustable series of parallel rollers arranged above the first-named series and carrying an endless metal slatted belt, a frame for supporting the upper adjustable series of rolls pivoted at one end and made adjustable at the other substantially as and for the purpose described.

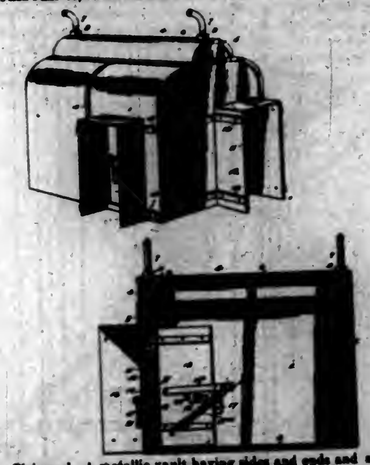


603,946. AUTOMATIC VEHICLE-BRAKE. JOSEPH S. ELLIOTT, Eddy, Tex. Filed Sept. 4, 1897. Serial No. 650,638. (No model.)

Claim.—1. The combination with the brake-beam rods 6', and levers 4, arranged in rear of the brake-beam and in the same plane therewith, of the yoke 7, having the central hook 29, the spring 28, attached to the latter, the pull-rod, threaded as specified and passing through a threaded bore in the yoke, and the hand mechanism, comprising the lever 26 arranged parallel to brake-levers 4, the rod 24, and hand-lever 25, as shown and described.

2. The combination, with the brake apparatus proper, of the link 19, suspended from the front axle, the device 16, consisting of an elongated link having an upward curve 17, at its middle, the pull-rod passing through said device and having the cross-pin 20 arranged in rear of the curved portion of said device, and the lift lever and rod attached to the front end of said device, as shown and described.

603,947. TRUCK FOR HANDLING RAILWAY-RAILS. THOMAS L. FLANAGAN, Vicksburg, Miss. Filed Aug. 9, 1897. Serial No. 647,895. (No model.)



Claim.—1. A hand-truck having a single, swiveled wheel, a carrying-bar having a jaw at its forward end and a handle at the other end, a jaw-lever having a fulcrum on said bar and provided with a jaw at its forward end, and an operating-lever having a fulcrum on the handle its forward end connected by a toggle-link to the end of the jaw-lever and its other end held by a loop on the handle, substantially as described.

2. A hand-truck having a carrying-bar, a single caster-wheel swiveled thereon, a jaw-lever having a fulcrum on said bar, its forward end provided with a jaw adapted to clamp the head of a T-rail between it and a like jaw on the extremity of the beveled forward end of said bar, an actuating-lever coupled to the rear end of the jaw-lever and a loop pivoted on the handle to lock the operating-lever, substantially as described.

3. A hand-truck having jaws formed to grasp the head of a T-rail transversely, one of said jaws having a vertical slot to admit the web of the rail and clamp the end of the same in line with the truck, substantially as described.

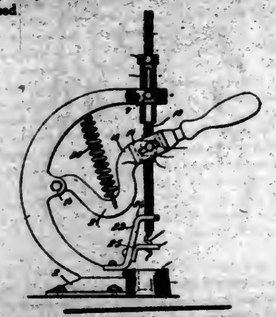
4. The combination with a hand-truck of a fixed jaw and a lever having a jaw on its forward end, said jaws being adapted to grasp the sides of the head of a T-rail the fixed jaw having a central vertical slot or opening to admit the web of the rail and enable the jaws to grasp the head when the rail is in line with the trucks, substantially as described.

603,948. CYCLONE-VAULT. DARWIN H. HARLOW, Preston, Minn. Filed June 14, 1897. Serial No. 641,295. (No model.)

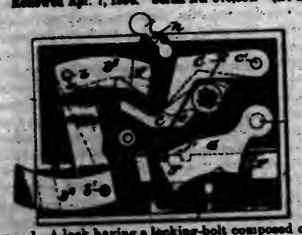
Claim.—1. A metallic vault having sides and ends and a metal floor, the said sides being extended upwardly to form the top, and an upper central ventilating-cupola of elongated form having its covering meeting the extension of the sides and secured thereto, substantially as and for the purposes specified.

2. In a cyclone-vault, the combination of a metallic inclosing frame, an upper ventilating-cupola, and elongated screw-threaded tubes adjustably mounted in said cupola and having upper bent ends, substantially as and for the purposes specified.

3. A cyclone-vault constructed of metal and adapted to be embedded in the ground and having door-entrances with hinged doors coacting therewith, guards mounted over the said door-entrances, latches in connection with the doors adapted to be operated from the exterior, an upper ventilating elongated cupola, and ventilating-tubes adjustably mounted in said cupola and having upper bent ends, substantially as and for the purposes specified.



603,949. RECEPTACLE FOR CHEWING-GUM. CHARLES W. HARDING, Hunnewell, Kans. Filed July 2, 1897. Serial No. 643,304. (No model.)



Claim.—A box or receptacle for the purpose described, made up of a flat circular base-plate, having a securing-pin upon the under side thereof, located diametrically of said base-plate, a triangular stud or spur upon the opposite side of said base-plate, located centrally thereof and lying in line with the securing-pin upon the opposite side, and a body portion made up of two sections, one of which sections comprises a portion of the sides which is semicircular in cross-section and is secured at its lower edge to said base plate, and a semicircular portion of the top, which is secured to the upper edge of said side portion, the said side portion and top portion lying, when the box is in its adjusted position, beneath the stud or spur, and the other section comprising the remaining portion of the sides, which is semicircular in cross-section, is pivoted to the rigid side portion, and has secured to its upper edge the remaining semicircular portion of the top, the said pivoted section being disconnected from said base-plate, but adapted to swing laterally thereof and to have its lower end closed by the projecting portion of said plate.

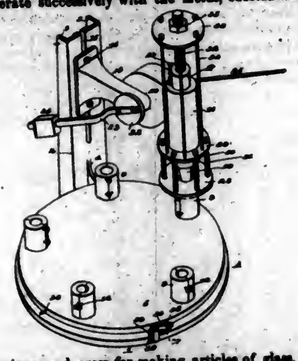
603,950. CORK-PULLING MACHINE. JAMES R. HAWKINS, St. Louis, Mo. Filed Aug. 23, 1897. Serial No. 649,128. (No model.)

Claim.—A cork-pulling machine comprising a frame provided with an opening in the upper portion thereof, a lever pivoted to said frame and having an elongated slot therein, a shaft provided with spirally-arranged grooves and having a cork-screw at its lower end, a block embracing the shaft and adapted to lie within the elongated slot in said lever, laterally-extending arms upon said block extending through the elongated slots in the sides of said levers at right angles to the slot in which said block fits, collars upon the shaft above and below said block, a vertically-movable sleeve surrounding the shaft and having a head thereon, projections on the inner periphery of said sleeve adapted to fit within the grooves in said shaft whereby said shaft is caused to rotate during the downward movement thereof when the head engages the upper surface of the casting, and means for restoring the parts to their normal positions after the lever has been depressed.

603,951. LOCK. ROBERT H. HEARN, Dyer, Tenn. Filed June 3, 1897. Renewed Apr. 7, 1898. Serial No. 676,881. (No model.)

Claim.—1. A lock having a locking-bolt composed of a straight middle portion with a pivot-hole at each end, and offsetting curved locking ends at opposite ends and on opposite sides of the straight portion, each being described about the pivot-hole of the opposite end and having bevel-faces upon opposite sides substantially as and for the purpose described.

2. A lock having a locking-bolt composed of a straight middle portion with a pivot-hole at each end, and offsetting curved locking ends at opposite ends and on opposite sides of its straight portion, each being described about the pivot hole of the opposite end and having bevel-faces upon opposite sides, a lift-bar pivoted at one end to the case and having its other end resting beneath the upper end of the main bolt, and a knob-shaft and sleeve with tappets lying beneath and acting upon the lift-bar substantially as and for the purpose described.



3. A lock having a locking-bolt composed of a straight middle portion with a pivot-hole at each end and offsetting curved locking ends at opposite ends and on opposite sides of its straight portion, each being described about the pivot-holes of the opposite end and having bevel-faces upon opposite sides, a lift-bar pivoted at one end to the case and having its other end resting beneath the upper end of the main bolt, a knob-shaft and sleeve with tappets arranged beneath and acting upon the lift-bar, and a supplemental key-bolt with tumbler arranged to be projected against the inner side of the lower end of the main bolt to lock it substantially as and for the purpose described.

603,952. PRESS FOR MAKING ARTICLES OF GLASSWARE. WILLIAM A. HEBERT and CHARLES H. BRADY, Washington, Pa., assignors to the Hazel Glass Company, same place. Filed May 14, 1897. Serial No. 636,662. (No model.)

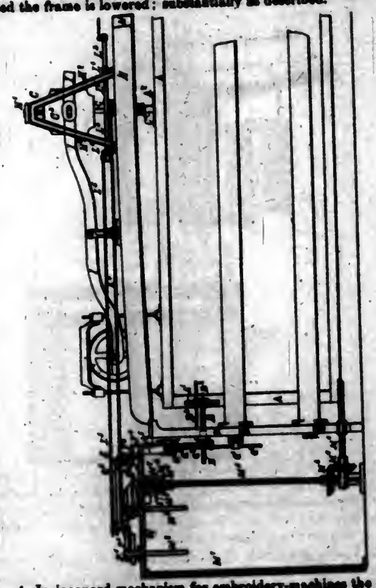
Claim.—1. In an improved press for making articles of glassware, the combination of a circular mold-carrier rotatable in a horizontal plane, a plurality of molds thereon, a bracket adjacent to said mold-carrier, a supporting-arm carried by said bracket and arranged tangentially to the mold-carrier, and a plunger arranged to reciprocate with respect to the supporting arm and to cooperate successively with the molds, substantially as set forth.

2. In an improved press for making articles of glassware, the combination of a circular mold-carrier rotatable in a horizontal plane, a plurality of molds thereon, a bracket adjacent to said mold-carrier,

a supporting-arm carried by said bracket and arranged tangentially to the mold-carrier, means for adjusting said arm vertically, and a plunger arranged to reciprocate with respect to the supporting-arm and to coöperate successively with the molds, substantially as set forth.

3. In an improved press for making articles of glass, the combination of a base 1, a mold-carrier rotatably mounted on said base, a plurality of molds secured to said mold-carrier, a bracket 2, a supporting-arm 13 adjustably mounted on said bracket, a plunger-cylinder 16 at the front end of said supporting-arm, a plunger-carrier 17 in said cylinder and with respect to which said molds are movable, a plunger removably secured to the lower end of said plunger-carrier, a main operating-shaft 21 in said supporting-arm, a toothed segment 26 keyed to said shaft, and a rack 27 on the plunger-carrier and with which said segment engages, substantially as set forth.

4. In an improved press for making articles of glass, the combination of a base 1, a mold-carrier rotatably mounted on said base, a plurality of molds secured to said mold-carrier, a bracket 2, a supporting-arm 13 adjustably mounted on said bracket, a plunger-cylinder 16 at the front end of said supporting-arm, a plunger-carrier 17 in said cylinder and with respect to which said molds are movable, a plunger removably secured to the lower end of said plunger-carrier, a main operating-shaft 21 in said supporting-arm, a toothed segment 26 keyed to said shaft, a rack 27 on the plunger-carrier and with which said segment engages, and a counterbalance-weight connected to said shaft, substantially as set forth.



5. In an improved press for making articles of glass, the combination of a base 1, a mold-carrier rotatably mounted on said base, a plurality of molds secured to said carrier, a bracket 2, a supporting-arm 13 adjustably secured to said bracket, a plunger-cylinder 16 at the free end of said arm, a plunger-carrier 17 movable vertically in said cylinder, means for operating said plunger-carrier, a plunger at the lower end of said plunger-carrier, a collar 29 movable on said cylinder, a mold-closing disk, yielding connections between said disk and said collar, a screw-threaded rod 32 connected to the plunger-carrier, a disk 33 on said rod, adjusting-nuts 35 for adjusting the positions of said disk with respect to the rods, and connecting-rods 34 connecting the disk 33 with the collar 29, substantially as set forth.

608,953. WORK-FEEDING MECHANISM FOR EMBROIDERING-MACHINES. HENRY HILL, Nottingham, England. Filed July 14, 1894. Serial No. 518,120. (No model.)

Claim.—1. In a work-feeding mechanism for embroidering-machines, the combination with the jacquard mechanism, of the work-frame, the screw C connected to the frame, for moving the frame vertically, a pinion secured to the screw, a double rack, the three-armed lever, a second pinion mounted on one arm of said lever, and constantly in gear with the first-mentioned pinion, the rods carried by the other arms of the lever and connected to the jacquard mechanism, whereby the second pinion may be brought into gear with either of the racks; substantially as described.

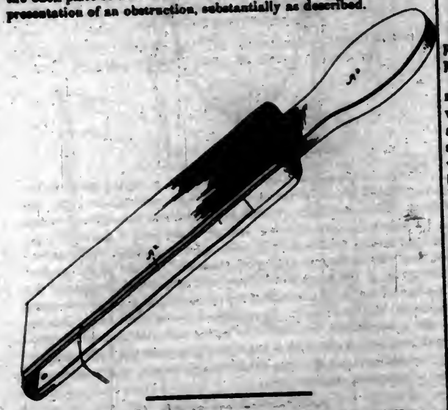
2. In a work-feeding mechanism for embroidering-machines, the combination with the jacquard mechanism of a screw E for moving the frame pinion E secured to the screw double rack G G′ and pinion F, of a lever F' F^3 for carrying the axle F^2 of the pinion E the said lever being operated by the jacquard through the rods F^6 F^4 so as to move the pinion E into gear with either of the racks G G′ substantially as described.

3. In a work-feeding mechanism for embroidering machines, the combination with the work-frame, the counterweight formed with an axial hole, the vertical screw passing through the weight, and engaging the frame at one end and the weight at the other, the threads of the screw at the point of engagement with the weight and frame being oppositely pitched, and connections between the screw and jacquard mechanism for turning the screw whereby as the weight is raised the frame is lowered; substantially as described.

4. In jacquard mechanism for embroidery-machines the combination with a screw C for moving the frame A pinions J and J′ and a double rack L L^2 of change gear-wheels Y Y′ for connecting the pinions J and J′ substantially as described.

5. In jacquard mechanism for embroidery-machines the combination with a screw C for moving the frame A pinions J and J′ and a double rack L L^2 of change gear-wheels Y Y′ for connecting the pinions J J′ and an arm Y^4 for carrying the adjustable axle Y^3 of the pinion Y′ substantially as described.

6. In a work-feeding mechanism for embroidering-machines, the combination with the jacquard mechanism of the dropper-cage and pattern-card cylinder, the droppers carried by the dropper-cage and arranged in two rows parallel to the axis of the card-cylinder and provided with catches, and the pivoted locking-bars extending across the cage for engaging with the catches on the droppers to hold the droppers elevated during the traverse of the dropper-cage; substantially as described.



7. In a work-feeding mechanism for embroidering-machines, the combination with the jacquard mechanism, of the dropper-cage, the droppers provided with catches carried by said cage, the pivoted locking-bars extending across the cage on opposite sides thereof and engaging the catches of the droppers to hold the droppers elevated and the vertically-moving slide at one end of said dropper-cage working between the locking-bars and provided with two pivoted catches adapted to engage with the locking-bars to open the same and permit the droppers to fall; substantially as described.

8. In a work-feeding mechanism for embroidering-machines, the combination with the jacquard mechanism, of the dropper-cage, the vertically-movable T-shaped slides carried at the center of the dropper-cage, the selectors normally resting on the top of said slides, the pattern-card for raising the slides and thus lifting the selectors; substantially as and for the purpose set forth.

9. In a work-feeding mechanism for embroidering-machines the combination with the jacquard mechanism, the work-carrying frame, the screws connected to the frame for moving the frame vertically and horizontally, pinions carried by said screws, the double rack, the three-armed lever, pinion carried by one of the arms in mesh continuously with the pinion on the screw, the bars connected to the lever and to the jacquard mechanism, whereby the pinion on the lever-arm may be thrown into engagement with either one of the racks and the frame thus given a movement in two directions; substantially as described.

608,954. RAZOR-STROP. THOMAS G. HOLLAND, Philadelphia, Pa. Filed May 5, 1897. Serial No. 634,962. (No model.)

Claim.—A razor-strop comprising a handle, a rigid back plate secured to the handle and provided with a suitable stropping-surface, a resilient, metallic front plate secured at one end to the handle, and having its other end bent or curved to form a flange to be secured to the under side of the back plate, thereby leaving a clear space, practically the entire length of the body of the strop, in which to permit the front plate to yield, and a stropping-surface secured to the resilient front plate, the inturned ends of the flange of the front plate being let into the back plate so as to lie flush with the same, thereby obviating the presentation of an obstruction, substantially as described.

608,955. ADJUSTABLE VEHICLE-SPRING. JOSEPH S. HOLLIDAY, Parker's Landing, Pa. Filed Oct. 6, 1897. Serial No. 654,242. (No model.)

Claim.—1. In a device of the class described, the combination with a body, of rock-shafts journaled thereon and provided with oppositely-disposed arms extending outward and inward, the outer arms being designed to be supported upon the running-gear, a spring supporting the inwardly-extending arms of the rock-shafts and provided at its ends with notched hangers mounted on the body at the ends of the spring and provided with corresponding notches, and adjustable loops or stirrups depending from the hangers and receiving the ends of the spring and adapted to engage the said notches, substantially as and for the purpose described.

2. In a device of the class described, the combination with a body, of rock-shafts journaled thereon and provided with oppositely-disposed arms extending outward and inward, the outer arms being designed to be supported upon the running-gear, a spring supporting the inner arms of the rock-shafts, and means for adjustably connecting the ends of the spring with the body of the vehicle, whereby the distance between the points of connection may be varied, substantially as and for the purpose described.

3. In a device of the class described, the combination with a body, of rock-shafts journaled thereon and provided with oppositely-disposed arms extending inward and outward, and means for movably engaging the inner arms of the rock-shaft with the spring and for permitting such arms to move longitudinally of the spring and for relieving the latter of friction, substantially as described.

4. In a device of the class described, the combination with a body, of rock-shafts journaled thereon and provided with inwardly-extending arms, a spring, and rollers connected with the arms and engaging the spring, substantially as described.

5. In a device of the class described, the combination with a body, of rock-shafts journaled thereon and provided with arms; rollers journaled on the arms, a spring engaged by the rollers, and a guide mounted on the spring, extending over the rollers and adapted to cause the arms to operate simultaneously, substantially as described.

6. In a device of the class described, the combination with a body, of rock-shafts journaled thereon and provided with arms, rollers mounted on the arms, a spring engaged by the rollers, a block mounted on the spring and interposed between the rollers, and a guide-plate secured to the block and projecting therefrom over the rollers, substantially as described.

608,956. WHEEL TIRE AND FELLY. THOMAS B. JEFFERY, Chicago, Ill. Filed Nov. 14, 1894. Serial No. 528,706. (No model.)

Claim.—1. A tire of flexible material having separable edges and provided on its exterior convex surface and near each edge with two parallel ribs or projections, substantially as described.

2. The combination of the rim provided with a circumferential recess having in each of its walls or sides two channels, the transverse distance between the sides of the inner channels nearest the axis of the wheel being less than the transverse distance between the sides of the outer channels, and a tire-sheath of flexible material provided with ribs adapted to be seated in said channels and held there by the air-pressure of the inner tube, substantially as described.

3. The combination of an annular tire-sheath of flexible material having near each of its edges two parallel ribs or projections, and a wheel-rim having a recess with its walls grooved and channeled to receive said ribs, the ribs on said sheath adapted to be held to their respective seats in said channels by the pressure of the inner tube, substantially as described.

4. The combination with a tire-sheath provided on its exterior surface and adjacent to each edge with two parallel ribs or flanges, one rounded in cross-section and the other angular in cross-section, of the rim provided on its convex face with channels adapted to receive said ribs the said sheath held to the rim by the pressure of the inner tube, substantially as described.

5. The combination with the rim having a series of spoke perforations, of a washer on the tire-face of the rim surrounding a spoke perforation and against which the spoke-head directly bears, said washer having upward projections which engage the base of the tire-sheath, substantially as described.

6. The combination with the rim having a series of spoke perforations of a substantially rectangular washer on the tire-face of the rim, said washer provided with prongs for engaging it to the face of the rim and with upward projections to engage to the tire, substantially as described.

608,957. FINGER-GAGE FOR RINGS. ALFRED JOHNSON, Philadelphia, Pa. Filed July 19, 1897. Serial No. 644,108. (No model.)

Claim.—1. An instrument for measuring the external diameter or circumference of an object, comprising a frame, radially-movable members having heads at their inner ends adapted to close upon the object to be measured, a sliding pointer for indicating the result, and mechanism for simultaneously operating all of the radially-movable members and sliding the pointer in a rectilinear path, substantially as described.

2. A measuring instrument, embodying a frame, radially-movable members, a toothed rotatable disk for simultaneously operating said members, a sliding pointer, an operating-worm meshing with said disk, a meshlated gear-wheel meshing with said worm, and a pinion rotating with said gear-wheel and operatively connected to the pointer, substantially as described.

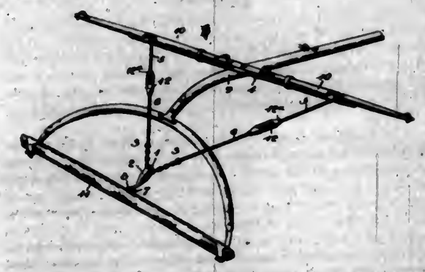
3. A measuring instrument of the character indicated, comprising a casing, members for engaging the article to be measured movable upon said casing, a pointer mounted to slide along said casing, a rack upon said pointer, a worm mounted in the casing, means for conveying motion from the worm to the measuring members, and a plate pivoted upon the casing, said plate having racks in mesh with the worm and with the rack upon the pointer whereby in the movement of the measuring members a corresponding motion is transmitted to the pointer; substantially as described.

4. A measuring instrument of the character indicated, comprising a casing, members upon said casing for engaging the article to be measured, slots upon said casing, a cross-bar removably fitting in said slots, a pointer having a groove therein fitting upon the cross-bar, means for transmitting motion to the measuring members, and means for imparting to the pointer a motion corresponding to that of the measuring members; substantially as described.

5. A measuring instrument of the character indicated, comprising a casing, members for engaging the article to be measured upon said casing, a worm journaled across said casing, connections between the worm and the measuring members for moving them in the operation of measuring, a pointer upon said casing, said pointer being provided with a groove, a cross-bar fitting in said groove and resting in slots upon the casing, a rack upon said pointer, a pintle upon the casing between the rack and the worm, a plate pivoted upon said pintle, said plate having a rack upon one side in engagement with the worm and extending above the cross-bar, and a second plate upon said first plate, said second plate being provided with a rack in engagement with the rack upon the pintle; substantially as described.

603,958. BOTTLE AND CAP. JOHN F KRIEG, Charleston, W. Va. Filed Apr. 21, 1896. Serial No. 588,498. (No model.)

Claim.—1. A bottle having independent loops attached to its neck combined with an inclosing frangible cap extending over the neck of the bottle and having on its inner sides engaging lugs or hooks adapted to engage the loops and hold the cap locked substantially as shown and described

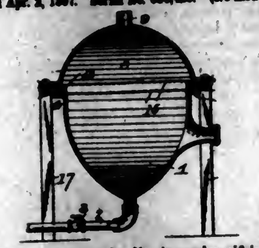


2. As an article of manufacture a frangible bottle-cap adapted to inclose the mouth and neck of the bottle, and having on its inner walls rigid inwardly-projecting lugs having locking-seats on their upper edges adapted to engage with loops attached to the bottle-neck substantially as and for the purpose described.

3. The bottle having flanges or collars a a^2, in combination with the wire yoke B having attached loops b b, and the frangible cap C with inwardly-projecting retaining lugs or catches c c engaging said loops substantially as and for the purpose described.

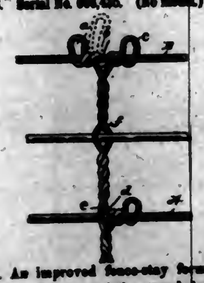
4. A bottle having loops attached to its neck portion combined with an inclosing cap extending over the neck of the bottle and having a central depressed end d and on its inner sides lugs or hooks adapted to engage the loops and hold the cap locked substantially as and for the purpose described.

5. The combination of a bottle having independent loops attached to its neck, an inclosing frangible cap extending down over the neck of the bottle and having rigid inwardly-projecting lugs adapted to lock beneath the loops, said bottle-neck and inclosing cap having interlocking clutch-sections to prevent the twisting of the cap substantially as and for the purpose described.



603,959. DRAFT-EQUALIZER. WARREN LEHEMY, Frederic, Kans. Filed Nov. 18, 1897. Serial No. 658,961. (No model.)

Claim.—1. In a device of the class described, the combination with a running-gear, of rods provided with eyes receiving the pivots of the singletrees, the hooks rigid with the eyes and arranged at right angles to the plane of the same, and engaging the front edge of the doubletree, and means for movably connecting the rods with the front axle, substantially as described.

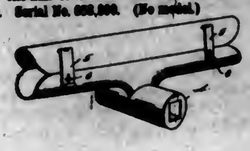


2. A draft equalizer comprising a pulley-block having a pulley and designed to be centrally connected with the front axle of a vehicle, a chain passing around the pulley, rods provided at their front ends with eyes to receive the pivots of singletrees and having hooks arranged at right angles to the plane of the eyes and adapted to engage the front edge of a doubletree, and means for connecting the rods with the ends of the chain, substantially as described.

603,960. GASOLENE-PURIFIER. FRANK MERRIOT, Bloomington, Ill. Filed Apr. 2, 1897. Serial No. 630,489. (No model.)

Claim.—In an apparatus for filtering and purifying gasolene the combination with the lower section having a rectangular upper end formed with horizontal and vertical flanges, and the sides curved so as to form a contracted lower end provided with a draw-off pipe, and said section formed with an inlet-opening above said contracted end, and the inlet-pipe connected therewith, of the upper section, rectangular at the lower end formed with horizontal flanges and the sides curved forming a contracted upper end, the outlet-pipe connected therewith, the rectangular frame seated on the horizontal flanges of said lower section, the canvas or textile material secured to opposite sides of said frame with a space therebetween, the bolts connecting said sections and the legs bolted to the flanges of the lower section, substantially as described.

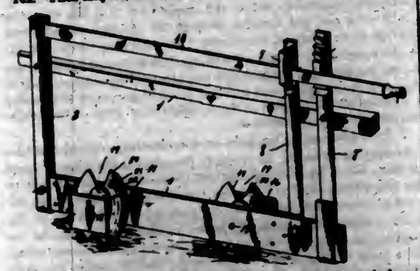
603,961. FENCE-STAY. CHARLEY R. MORROW, Pine, Ind. Filed Jan. 12, 1898. Serial No. 666,635. (No model.)



Claim.—1. An improved fence-stay formed of a plurality of strands twisted together, one of the strands being formed with projecting binding-loops with the other strand extending longitudinally past said loop and serving to hold the stay from longitudinal contraction while the loops are twisted about the fence-wires, substantially as shown and described.

2. An improved fence-stay formed of doubled and twisted wire, the upper end of the stay being formed into three loops a, b, and c, the center loop being adapted to receive the fence-wire, said loops a and c being adapted to be twisted about said wire, substantially as shown and described.

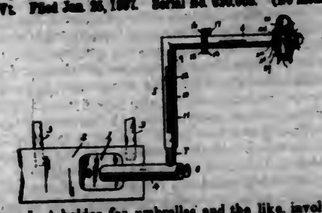
3. An improved fence-stay formed of a plurality of twisted strands, the upper end of the stay being formed into three loops a, b, c, the center loop adapted to receive the fence-wire, and the side loops adapted to be twisted around the fence-wire, and intermediate loops d, formed of one of the wires forming the stay, substantially as described.



4. An improved fence-stay formed of a plurality of wires twisted together, the upper end of the stay formed with two upwardly-projecting parallel loops adapted to receive the fence-wire between them and to be twisted thereabout, and one of the wires provided with an intermediate loop extending upward and longitudinal to the stay to receive and support a fence-wire while being placed in position, and to be twisted thereabout, substantially as shown.

603,962. BUGGY-BOW REST. NORMAN MCAWLAY, Hill City, S. D., assignor of one-half to Claudio Von Weyhrmann, same place. Filed Oct. 2, 1897. Serial No. 653,599. (No model.)

Claim.—A buggy-bow rest comprising a bolting-socket, a rest extending transversely across the top of the bolting-socket in a plane at a right angle thereto and provided with an upper concave side, a curved clasp conforming in shape to the said rest and hinged at one side thereto, and supplemental clasps movably attached to said curved clasp and adapted to engage locking devices on the rest, substantially as described.

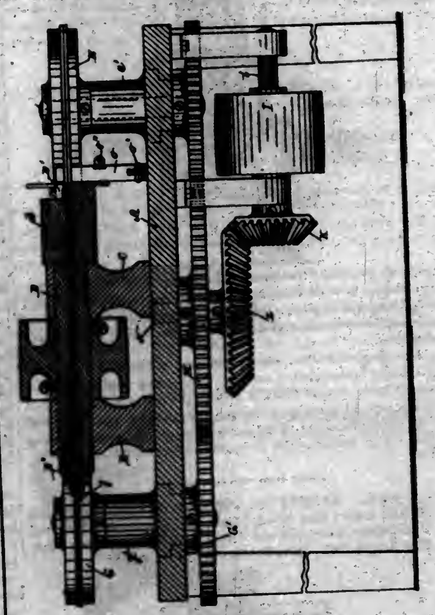


603,963. COTTON-CHOPPER. FRANK MCCLLOUGH, Mooreville, Tex. Filed May 26, 1897. Serial No. 638,094. (No model.)

Claim.—1. In cotton-choppers, the combination of a main bar or beam, a front standard, a hoe-carrier bar pivoted to the lower end of said standard and provided with bearing extensions having position on opposite sides thereof, a cotton-chopping hoe revolvable between the carrier-bar and each of said bearing extensions, a rear standard connected with the rear end of the main connecting-bar and provided with a loop-shaped retaining end adapted to receive the rear end of the hoe-carrying bar and provided at its upper end with a rack, and a lever pivoted to the upper end of the front standard and having its rear end adapted to engage with the said rack, substantially as described.

2. In a cotton-cultivator, the pivoted and adjustable hoe-bar provided with bearing extensions on its opposite sides, in combination with chopping-hoe disks journaled in said bar and bearing extensions provided with radial slots or openings, and cutting-blades adjustable in said slots, substantially as described.

603,964. UMBRELLA-HOLDER. LOUIS A. D. HOUGHTON, Shelburne, Vt. Filed Jan. 26, 1897. Serial No. 620,602. (No model.)

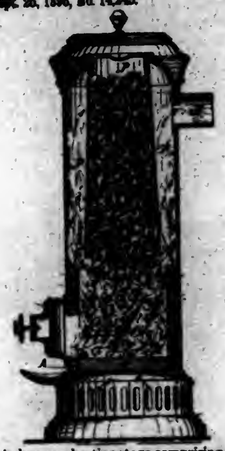


Claim.—1. A holder for umbrellas and the like, involving the combination of a base-plate for convenient attachment to a body-bolt or other like support having a vertical face, a main stem projecting horizontally from said base-plate, an axially-adjustable, telescopic piece extending vertically from the main stem, an axially-adjustable, horizontal socket-arm, and a socket, whereby the umbrella may be supported away from the body, and may be adjusted at any desired elevation and angle, substantially as described.

2. A holder of the class described, comprising a supporting-arm formed of a main stem, a socket-stem, and a sectional elbow connecting said stems, one end of said elbow being corrugated and fitted in the main stem, a screw carried by said main stem and adapted to engage the corrugated end of the elbow, whereby the latter is locked against rotation, means for locking the sections of the elbow together, adjustable connections between the elbow and the socket-stem, whereby said socket-stem is adjustable upon the elbow, a socket carried by the socket-stem and adapted to receive an umbrella or the like, said socket being adjustable upon said socket-stem, and locking-arms carried by said socket and adapted to secure an umbrella or the like within said socket, substantially as described.

603,965. DOWEL-MAKING MACHINE. OSCAR H. ORDWAY, South Framingham, Mass., assignor to Albert H. Ordway, same place. Filed Apr. 5, 1897. Serial No. 630,668. (No model.)

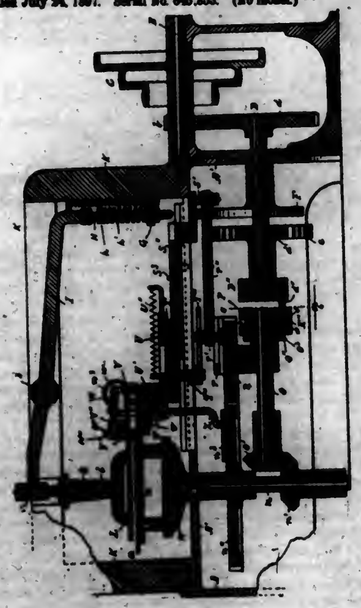
Claim.—In a dowel-making machine, the combination with leading feed-rollers having angularly-grooved peripheries for feeding a square dowel-blank, of the rotary hollow spindle arranged in bearings in rear of the feed-rollers and having a rearwardly-tapered delivery end, a cutter-head fixed on the forward end of the rotary spindle and carrying an adjustable cutter arranged to rotate circumferentially about the square blank and reduce it to cylindrical form, delivery-rollers having semicircular grooved peripheries for grasping the round dowel, the tapering delivery end of the spindle extending between the grooves of the delivery-rolls, and a guide for the blank arranged between the feed-rolls and cutter-head and in close proximity to the latter, said guide consisting of two yielding and expansible jaws having angular recesses on their inner adjacent sides each corresponding to one-half the sectional shape of the square blank and operating to hold the latter against the twisting action of the cutter-head, substantially as described.



603,966. THILL-COUPLING. JOHN J. PHILLIPS, Grayson, Ky. Filed Sept. 17, 1897. Serial No. 652,015. (No model.)

Claim.—1. In a coupling for thills and the like, the combination of a clip-iron having semispherical sockets in its opposite sides in transverse alinement, a pole or thill, irons placed upon opposite sides of the pole or thill and projecting in the rear thereof and having corresponding semispherical sockets in their inner faces, balls seated in the sockets of the clip-iron and the irons secured to the pole or thill and adapted to turn loosely so as to bring different portions in position to sustain the wear and strain, and means for adjustably connecting the irons with the pole or thill so as to compensate for wear between the balls and sockets, substantially as and for the purpose set forth.

2. In a coupling for thills and the like, the combination of a clip-iron having semispherical sockets in its outer sides in transverse alinement, a pole or thill, irons placed upon opposite sides of the pole or thill and having their rear ends extending beyond the rear end thereof and formed in their inner faces with semispherical sockets to register with the corresponding sockets in the clip-iron, balls loosely fitted in the corresponding and registering sockets of the clip and thill irons, a bolt adjustably connecting the thill-irons in the rear of the pole or thill to take up wear, and other bolts adjustably connecting the thill-irons with the pole or thill, substantially in the manner set forth for the purpose described.



608,967. SLOW-COMBUSTION STOVE. HENRI J. PIRON, Brussels, Belgium. Filed Oct. 16, 1896. Serial No. 608,128. (No model.) Patented in Belgium Aug. 17, 1892, No. 100,967; in France Sept. 20, 1892, No. 224,430; in Austria Sept. 26, 1892, No. 45,230; in Germany Oct. 11, 1892, No. 70,729; in Spain May 3, 1893, No. 14,560, and in Switzerland Sept. 25, 1896, No. 14,245.

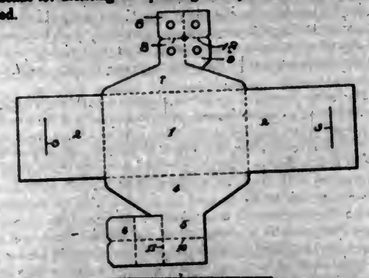
Claim.—1. A slow-combustion stove comprising a fire-holder provided with a closed bottom and a vertically-corrugated wall, and a casing fitting against the corrugated wall, providing vertical conduits open at top and bottom between the wall and the casing; substantially as described.

2. A slow-combustion stove comprising a fire-holder provided with a closed bottom and a vertically-corrugated wall, an envelop having exterior vertical gills and fitting against the corrugated wall providing vertical conduits open at top and bottom between the wall and the envelop and the casing surrounding the gills and providing vertical hot-air conduits open at top and bottom; substantially as described.

608,968. MACHINE FOR CUTTING OUT AND CHANNELING SOLES. ROBERT REID, Beverly, Mass., assignor of one-fourth to Sven M. Hallstrom, same place, and John F. Hendrickson, Boston, Mass. Filed July 24, 1897. Serial No. 645,803. (No model.)

Claim.—1. In a sole-cutting machine, in combination, a rotary drive-shaft, a rotary shaft in line therewith, clutch mechanism interposed between said shafts, a templet adapted to be rotated by said rotary shaft, a cutting-tool operating automatically to follow the contour of the templet during the rotation of the latter, a clamping device for holding the sole-blank on said templet, a pivoted lever supporting said clamping device at one end and at its opposite end carrying a depending rod provided with an adjusting-nut, a lever G pivoted at one end on the frame and intermediate its ends having an opening through which said rod extends, a coiled spring surrounding said rod and interposed between said adjusting-nut and lever G, a vertically-movable pin supporting the free end of said lever G, a cam operating to raise said pin, and thereby, through the mechanism described, operating to depress said clamp into yielding engagement with the sole-blank, means for releasing the clamp from such engagement when the cam has ceased to operate, and means operating automatically to throw said clutch mechanism into and out of engagement and to stop the rotation of the templet at the completion of each of its revolutions, substantially as described.

2. In a sole-cutting machine, in combination, a templet, means for rotating the same and for stopping the same at the completion of each of its revolutions, a clamping device operating automatically to clamp the sole-blank to the templet during the revolution of the latter and to release the sole at the completion of a revolution of the templet, a slide-plate mounted in guides in the frame, means for reciprocating said plate, a plate S' adjustably supported on said slide-plate, a plate T, pivotally supported on said plate S', means for oscillating said plate T, a tool-carrying slide U slidably supported in said plate T, a tool-carrier pivotally supported on said tool-carrying slide, and means for holding said tool-carrier normally in contact with the edge of the templet, substantially as described.



3. In a sole-cutting machine, in combination, a rotary drive-shaft, a rotary shaft in line therewith, clutch mechanism interposed between said shafts, means operating automatically to throw said clutch mechanism into and out of engagement and to stop the rotation of said rotary shaft when the clutch mechanism is out of engagement, a rotary templet-holder intermittently actuated by said rotary shaft, a clamping device operating automatically to clamp the sole-blank to the templet during the revolution of the latter and to release the sole at the completion of a revolution of the templet, an oscillating tool-carrier normally held in contact with the edge of the templet and operating automatically to follow the contour of the same during the rotation of the templet, substantially as described.

4. In a sole cutting, channeling and grooving machine a templet, means for rotating the same and for stopping the same at the completion of each of its revolutions, a clamping device operating automatically to clamp the sole-blank to the templet during the revolution of the latter and to release the sole at the completion of a revolution of the templet, an oscillating tool-carrier normally held in contact with the edge of the templet and operating automatically to follow the contour of the same during the rotation of the templet, a lever pivotally supported on the tool-carrier at one end and at its other end carrying the channeling and grooving tools, a spring holding said lever normally in a depressed position, and means operating automatically to lift said lever at a stated interval in the revolution of the templet whereby to raise the channeling and grooving tools out of contact with the sole-blank, substantially as described.

5. In a sole cutting, channeling and grooving machine, in combination, a templet, means for rotating the same and for stopping the same at the completion of each of its revolutions, a clamping device operating automatically to clamp the sole-blank to the templet during the revolution of the latter and to release the sole at the completion of a revolution of the templet, an oscillating tool-carrier normally held in contact with the edge of the templet and operating automatically to follow the contour of the same during the rotation of the templet, a lever pivotally supported on the tool-carrier at one end and at its other end carrying the channeling and grooving tools, a spring holding said lever normally in a depressed position, a vertically-movable rod journaled in the tool-carrier and having at its upper end a yoke located beneath said lever, and a gear rotating in unison with said templet and having on its upper surface a cam-surface adapted to engage the lower end of said rod at a stated interval in the revolution of the templet whereby to lift said lever and to raise the channeling and grooving tools out of contact with the sole-blank, substantially as described.

608,969. SAFETY-ENVELOP. JOHN W. RILEY, Ogden, Utah. Filed June 24, 1897. Serial No. 642,162. (No model.)

Claim.—A safety-envelop comprising a body with end folds or flaps having slits therein adapted to coincide, a lower flap with a laterally-projecting tongue, and an extension carrying an eyelet, the said tongue being passed through the coinciding slits in the end folds or flaps, and a closing-flap having a double tongue with an opening therein to engage the said eyelet, the said tongue on the lower flap being inserted in the slits in a longitudinal plane and said slits forming means for assisting in upsetting the eyelet, substantially as described.

608,970. AUTOMATIC BENCH CLAMP AND DOG. JAMES P. REESE, Kyle, Tex. Filed July 15, 1897. Serial No. 644,869. (No model.)

Claim.—1. In an automatic clamp for benches, the combination with a plate secured to the bench to be flush therewith, of a normally-fixed clamping member, having a straight clamping-face detachably secured to said plate, a movable clamping member detachably pivoted on said plate and having a curved clamping-face eccentric to its pivot, and provided with a slot concentric to the pivot, and a headed pin passing through the slot and detachably secured to said plate to prevent vertical movement of the pivoted member, substantially as described.

2. In an automatic clamp for benches, the combination with the plate removably secured to the bench and having a straight vertical flange at one side to form a clamping-face, of a segmental plate detachably pivoted at one of its apexes to the bench and having a curved clamping-face eccentric to the pivot, and a slot concentric thereto, and a headed pin passing through the slot and detachably secured to the bench to prevent vertical movement of the segmental plate, substantially as described.

3. In an automatic clamp for benches, the combination with a supporting-plate secured to the bench flush therewith, of a clamping-plate having a straight clamping-face, duck-bill pins projecting from the lower face of said clamping-plate and adapted to be removably seated in an undercut opening in the supporting-plate, straight pins projecting from the lower face of the clamping-plate adapted to be removably seated in openings in the supporting-plate, and a segmental plate removably pivoted at one of its apexes to the supporting-plate and having a curved clamping-face eccentric to its pivot, and means to hold the segmental plate against vertical movement, substantially as described.

4. In an automatic bench-clamp, the combination with a supporting-plate secured to the bench flush therewith and having a series of undercut openings, one of said openings having also a lateral recess, of a straight clamping-plate removably secured to the supporting-plate, a plate provided with a duck-bill pivot-pin removably seated in one of said undercut openings in the supporting-plate, said pivoted plate having a curved clamping-face eccentric to its pivot and a slot concentric therewith, and a pin extending through said slot and the opening in the supporting-plate having a lateral recess, said pin having spaced lugs on its lower end engaging respectively the upper and lower faces of the supporting-plate, and having also a shoulder to engage the pivoted plate on the side of the slot, substantially as described.

608,971. CARBID-CARTRIDGE. GEORGES DE ROBERT DE SALES, Lyons, France. Filed Feb. 10, 1897. Serial No. 622,823. (No model.) Patented in France Oct. 9, 1896, No. 260,880; in England Jan. 21, 1897, No. 1,033; in Switzerland Jan. 21, 1897, No. 13,983; in Hungary Jan. 21, 1897, No. 4,004; in Belgium Jan. 21, 1897, No. 125,850; in Russia Jan. 28, 1897, No. 1,051; in Austria Mar. 13, 1897, No. 871, and in Italy Apr. 12, 1897, LXXXV, 478.

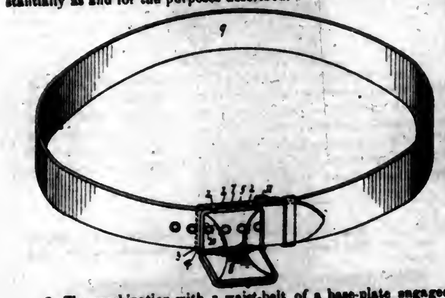
Claim.—As an improved article of manufacture, the herein-described carbid cartridge, consisting of a rigid sheath or casing provided with openings in the ends and side, a metallic carbid, such as calcium carbid, inclosed in said sheath with an agglomerating material to fill the interstices between the pieces of carbid, and removable waterproof coverings for the openings in the sheath or casing, substantially as specified.

608,972. PHOTOGRAPHIC-PLATE HOLDER. JACOB SCHAUB, Salt Lake City, Utah. Filed July 6, 1897. Serial No. 643,543. (No model.)

Claim.—1. A photographic-plate holder composed of a rigid frame, having an end section which is hinged longitudinally and provided with a groove in its inner side, and a shutter adapted to slide in said frame and engage the hinged section, for locking it closed, as specified.

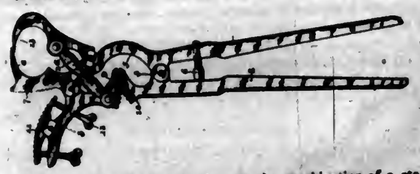
2. In a photographic-plate holder the combination, with a rigid rectangular frame, whose fixed end section 4, has a lengthwise rabbet, of a grooved movable section which is hinged longitudinally to such fixed section, and adapted to fold upon the same, and also engage the shoulder of the rabbet; and the slide or shutter adapted to enter the groove of the movable section, for locking it, as shown and described.

608,973. MEDICINE-DROPPER. JAMES R. SCHNEIDERMAN, Malden, N. Y. Filed July 20, 1897. Serial No. 645,206. (No model.)



Claim.—As a new article of manufacture, the herein-described medicine-dropper comprising the glass tube and rubber nipple secured thereto, a protective casing fitting on said tube and having a recess on its upper face receiving the lower edge of the nipple and the adjacent edge of the tube the side wall of said recess being undercut, whereby to receive an adhesive substance, and a stopper fitted on said tube below said protective casing, to which it is secured, said stopper being of a diameter less than said casing, whereby the latter will project over the upper edge of a bottle in which neck the said stopper is inserted, as and for the purpose set forth.

608,974. COMBINED BELT-BUCKLE AND PURSE OR BAG. ARNOLD W. SAMUELS, New York, N. Y., assignor to Mary Hess, same place. Filed Sept. 9, 1897. Serial No. 651,066. (No model.)



Claim.—1. A combined belt-buckle and purse, consisting of a base-plate having outwardly-projecting lugs and hooks at its upper and lower edge portions, and a purse composed of hinged frame-sections supported at their base by the outwardly-projecting lug, and one of the frame-sections engaged with and held by said hooks, substantially as and for the purposes described.

2. A combined belt-buckle and purse, consisting of a base-plate having outwardly-projecting lugs at its lower edge portion and engaging devices at its upper edge portion, and a purse composed of hinged frame-sections supported at their base by the outwardly-projecting lugs, and one of said frame-sections held and retained by said engaging devices at the upper edge portion of the base-plate, substantially as and for the purposes described.

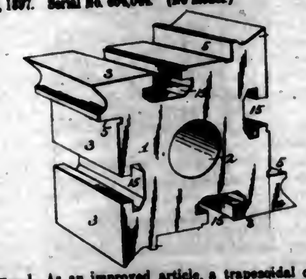
3. The combination with a waist-belt, of a base-plate engaged with the belt and having at its lower edge portion outwardly-projecting lugs and at its upper edge portion outwardly-projecting engaging devices, and a purse composed of hinged frame-sections supported at their base by the outwardly-projecting lugs and one of said frame-sections held and retained by said engaging devices, substantially as and for the purposes described.

608,975. HORSESHOE-NAIL CLENCHER AND HOOF-TRIMMER. MARTIN SCHMITT, Cahorn, Ind. Filed Nov. 13, 1897. Serial No. 658,998. (No model.)

Claim.—1. In a farrier's implement, the combination of a stationary handle, a jaw pivoted to the stationary handle, a lever bearing a bit and having pivotal connection between its ends with an extension of the stationary handle, a link connecting the pivoted jaw and lever, and an operating-handle pivoted to the stationary handle and adapted to actuate the aforesaid pivoted lever, substantially in the manner specified.

2. In a farrier's implement, the combination of a stationary handle having a jaw and a rest at its front end, a jaw pivoted to the stationary handle and adapted to act in opposition to the jaw thereof, a lever pivoted between its ends to the front portion of the stationary handle and bearing a bit to act in conjunction with the aforesaid rest, a link connecting the lever with the pivoted jaw, and an operating-handle pivoted to the stationary handle and adapted to actuate the aforesaid lever, substantially as and for the purpose described.

3. In a farrier's implement, the combination of operating-handles, a clenching-bit pivotally supported between its ends, and set-screws disposed to act upon the clenching-bit upon opposite sides of its pivotal connection for adjusting and holding it in an adjusted position, substantially as set forth.

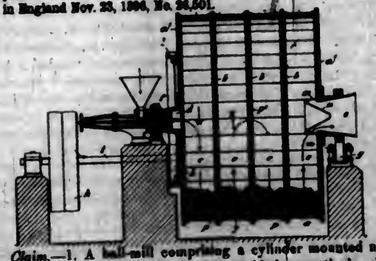


4. In a farrier's implement, the combination of a handle, a lever pivoted to the handle, a clenching-bit having pivotal connection between its ends with the lever, set-screws applied to the lever upon opposite sides of the pivotal connection therewith of the clenching-bit for properly positioning the latter and holding it in an adjusted position, and means for operating the pivoted lever, substantially as set forth.

5. In a farrier's implement, the combination of a stationary handle provided with a rest at its front end, a lever fulcrumed to the front portion of the stationary handle and having its rear end formed with a toothed segment, a clenching-bit having adjustable connection with the front end of the pivoted lever, and an operating-handle pivoted to the stationary handle and having a toothed segment at its front end intermeshing with the toothed segment of the pivoted lever, substantially as described.

6. In a farrier's implement, the combination of a stationary handle having a rest at its front end and a curved portion in the rear of the said rest, a lever pivoted between its ends to the front portion of the stationary handle and having a toothed segment at its rear end and its front end outwardly curved, a clenching-bit pivoted to the curved end of the lever and capable of adjustment, and an operating-handle pivoted to the stationary handle and having a toothed segment intermeshing with the toothed segment of the pivoted lever, both of the toothed segments adapted to enter the space formed by curving the front portion of the stationary handle, substantially as described.

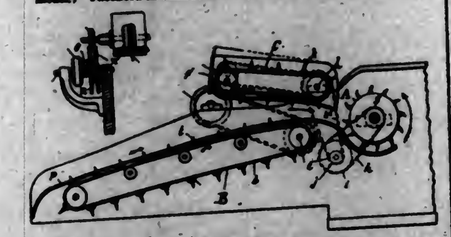
7. The herein-described farrier's implement, comprising a stationary handle having a jaw and a rest at its front end and its forward portion curved, a jaw pivoted to the front portion of the stationary handle, a lever pivoted between its ends to the front portion of the said handle and having its forward portion outwardly curved and a toothed segment at its rear end, a clenching-bit pivoted between its ends to the outer end of the pivoted lever, set-screws for adjusting and holding the clenching-bit in an adjusted position, links connecting the pivoted jaw with the rear end of the pivoted lever, and an operating-handle pivoted to the stationary handle and having a toothed segment at its front end intermeshing with the toothed segment of the pivoted lever, substantially as described.



608,976. CUTTER-HEAD. SAMUEL J. SHIMER, Milton, Pa. Filed Oct. 4, 1897. Serial No. 654,044. (No model.)

Claim.—1. As an improved article, a trapezoidal cutter-head formed with knife seats or faces formed with chip-breaks, beveled on the under side and alternately arranged and alternately inclined with respect to the axial line of the head, the shoulders formed integral with said head in rear of the chip-breaks and each shoulder parallel or coincident with the chip-break in front thereof, and extending from end to end of the head, forming an abutment for a gage, substantially as described.

2. As an improved article, a cutter-head formed with knife seats or faces extending from end to end of the head and each formed with a chip-break alternately arranged and alternately inclined inwardly and outwardly with respect to the axial line of the head, and said heads formed with T-slots intermediate the front and rear limits of the knife seats, the longitudinal shoulders each of which is parallel or coincident with the chip-break in rear of which it is located, but at an angle to the next succeeding chip-break, and said shoulders integral with said head and extending from end to end thereof, forming abutments for a gage, substantially as described.



608,977. BALL-MILL. REINHOLD SCHUBACH, Magdeburg-Buckau, Germany, assignor to the Fried. Krupp Grusonwerk, same place. Filed Dec. 21, 1896. Serial No. 616,561. (No model.) Patented in England Nov. 23, 1896, No. 24,501.

Claim.—1. A ball-mill comprising a cylinder mounted upon a horizontal axis, and having end walls provided respectively with an inlet and a hollow-trunnion outlet; said outlet having secured at its inner end a cylindrical wide-meshed sieve and a cone secured within and at the inner end of the sieve and projecting into the hollow-trunnion outlet; substantially as and for the purpose set forth.

2. A ball-mill comprising a horizontal cylinder having end walls provided respectively, with inlet and outlet hollow trunnions, the cylindrical wide-meshed sieve secured to the inner end of the outlet hollow trunnion, the cone secured within and at the inner end of the sieve and projecting into the outlet hollow trunnion, the vertical partitions having peripheral apertures or slots, a vertical partition having perforations at or near its center and located between the first-named partitions and means for rotating the cylinder; the partitions providing vertical ball-compartments; substantially as described.

608,978. THRESHING-MACHINE FEEDER. WILLIAM STEPHENSON, Morris, Canada. Filed Mar. 17, 1897. Serial No. 628,093. (No model.) Patented in Canada Jan. 26, 1896, No. 51,157.

Claim.—1. In a feeder for threshing-machines, the combination with a feeding-apron, of an auxiliary feeder mounted over the apron and capable of moving therefrom, and a differential friction-gear for driving the apron and consisting of two friction-wheels the relative position of which is varied by the position of the auxiliary feeder, whereby the apron is driven with a speed varying inversely with the distance separating the apron and the auxiliary feeder, substantially as described.

2. In a feeder for threshing-machines, the combination of two aprons between which the grain is fed, one of the aprons being movable whereby it may be moved away from the opposite apron by the grain, and a differential frictional gear driving one of the aprons and consisting of two friction-wheels, the relative position of which is varied by the position of the movable apron, whereby the apron is driven with a speed varying inversely with the distance separating the aprons, substantially as described.

3. In a feeder for threshing-machines, the combination of two aprons, between which the grain is fed, a pivoted frame carrying one of the aprons, whereby it may be swung away from the opposite apron by the grain, a friction-wheel mounted on the pivoted frame and driven from the pivoted apron, and a friction-disk bearing thereon and driving the opposite apron, whereby the relative position of the wheel and disk will be changed, and the speed of the apron driven thereby will be varied inversely with the distance separating the aprons, substantially as described.

4. In a feeder and band-cutter the combination of two traveling aprons, a pivoted frame for supporting one of the aprons, knives upon one of the aprons, means for driving one of the aprons, a differential gear between the two aprons, whereby one is driven by the other at a different and variable speed, the gear consisting of two friction-wheels the relative position of which is determined by the position of the frame, substantially as described.

5. In a feeder and band-cutter, the combination of two traveling aprons, a pivoted frame for supporting one of the aprons, knives upon one of the aprons, means for driving one of the aprons, a differential gear between the two aprons whereby one is driven by the other at a different and variable speed, the gear consisting of two disks and a wheel engaging therewith, the relative position of which disks and wheel is determined by the position of the frame, substantially as described.

6. In a feeder and band-cutter, the combination of a lower apron, a pivoted frame mounted therabove, an upper apron contained therein within the frame, knives upon the upper apron, and a differential gear consisting of two friction-wheels, the relative position of which is governed by the position of the movable frame, to communicate motion to the lower apron, whereby the lower apron is driven from the upper apron in a reverse direction, and at a speed slower than that of the upper apron, the speed varying inversely with the distance between the aprons, substantially as described.

7. In a feeder and band-cutter for threshing-machines, the combination with an upper and a lower apron, driven in opposite directions, of a frame pivoted at its rear end and carrying the upper apron, the grain being fed between the two aprons, cutting-knives upon and moving with the pivoted apron, and a differential gearing controlled directly by the position of the pivoted apron to drive the lower apron at a speed varying inversely with the distance separating the aprons, whereby the bands of the bundles will be cut and the bundles opened up and fed to the thresher, and the aprons will be separated upon excessive feed of bundles to the lower apron, substantially as described.

608,979. GANG-PLOW. WILLIAM STEPHENSON, Morris, Canada. Filed Mar. 17, 1897. Serial No. 628,040. (No model.) Patented in Canada Jan. 26, 1896, No. 51,157.

Claim.—1. The combination, in a gang-plow, of a frame having a series of slots therein, with a series of plows, the forward end of the beam of each plow resting within and being free for vertical movement in one of the slots, substantially as described.

2. The combination, in a gang-plow, of a frame with a series of plows held therein by guides in the front and in the rear of the plowshares, the forward guide of each plow permitting vertical movement when in use independently of all of the other plows, substantially as described.

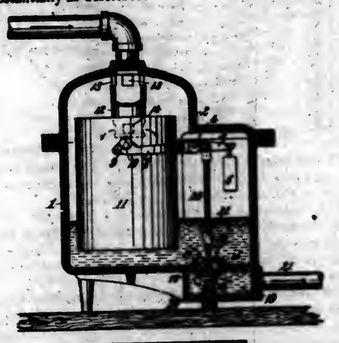
3. The combination, in a gang-plow, of a frame with a series of plows mounted and held therein by guides in the front and in the rear of the plowshares, the forward guide of each plow permitting independent vertical movement and the rear guides being secured by breakable pins which will let the plow swing to one side on striking an obstacle, substantially as described.

4. The combination, in a gang-plow of a frame, having a series of vertical slots, of a series of plows, each provided with a beam, the forward end of which plays up and down within the corresponding slot in the frame, substantially as described.

5. In a gang-plow, the combination, with a frame, having a series of vertical slots therein, of a series of plows, each provided with a beam the forward end of which plays up and down within the corresponding slot in the frame, and with a breakable part in the connections between the rear of each plow with the frame, substantially as described.

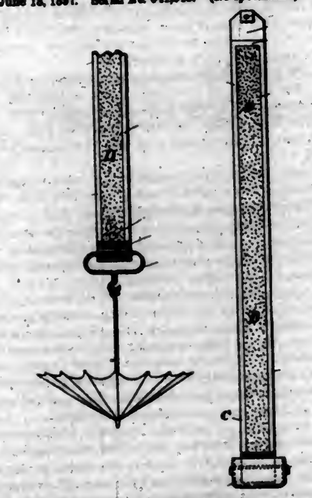
6. In a gang-plow, the combination with a frame, having a diagonal brace, provided with a series of vertical slots, of a series of plows, each provided with a beam the forward end of which plays up and down within the corresponding slot in the frame, traction-rods connected with the front of the frame and with the front of the beams, and a breakable part in the connection between the rear of each plow with the frame, substantially as described.

7. In a gang-plow, the combination, with a frame, having two diagonal braces, one of the said braces having a series of vertical slots therein, of a series of plows, each plow having a beam projecting forwardly through and vertically movable in one of the slots, a traction rod connected with the forward end of each beam, a series of adjustable brackets mounted on the other brace, a rod on each plow projecting rearwardly through one of the brackets, and a roller carrying the rear of the frame, substantially as described.



8. In a gang-plow, the combination, with a frame, having two diagonal braces and a front brace, one of the said diagonal braces having a series of vertical slots therein, of a series of plows, each plow having a beam projecting forwardly through and vertically movable in one of the slots, a traction-rod connected with the forward end of each beam, and spring interposed between the said rods and the front brace, substantially as described.

608,980. STEAM-TRAP. BERNHARD THIEME, New Orleans, La. Filed June 15, 1897. Serial No. 641,264. (No model.)

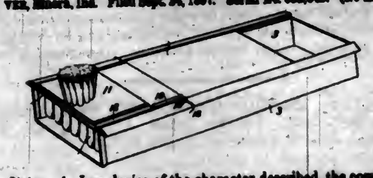


Claim.—1. In a steam-trap, the combination of a trap-chamber having an inlet in its top and an outlet at the bottom, a lever fulcrumed in said trap-chamber and provided with an open-top vessel at one end and a weight at the other end, an outlet-valve connected with said lever at a point between the weight and the lever-fulcrum, and a vertically-depending inlet-pipe connected with the trap-chamber inlet immediately above the open-top vessel and provided with a closed lower end and with lateral lower outlets for discharge of water into the open-top vessel and with lateral upper outlets or passages for steam to equalize the pressure in the trap-chamber and connected steam apparatus, substantially as described.

2. In a steam-trap, the combination of a trap-chamber having in its bottom an upwardly-seating outlet-valve, a lever fulcrumed in the trap-chamber and having an open-top vessel attached to one end and

a weight attached to the other end, means for suspending and operating the upwardly-seating outlet-valve from the said lever at a point between the lever-fulcrum and the said weight, an inlet-pipe connected with the cover of the trap-chamber at a point above the counterpoised open-top vessel, and a vertically-depending pipe closed at its lower end and having its upper end in communication with said inlet-pipe and the said depending pipe being provided in its lower portion with lateral outlets for discharge of water into the open-top vessel and having in its upper portion openings or passages for steam to equalize the pressure in the trap-chamber and the connected steam apparatus, substantially as described.

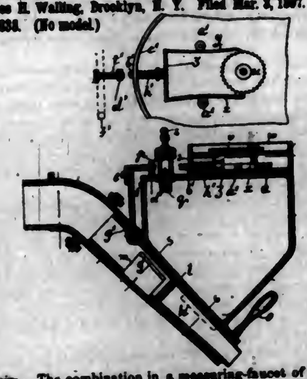
608,981. STICKY FLY-PAPER. HUGO TEUS, Grand Rapids, Mich. Filed June 13, 1897. Serial No. 641,315. (No specimens.)



Claim.—1. An insect-catcher comprising a strip of paper coated with sticky material forming a web adapted to fold upon itself and provided at one end with means for suspending the same, a hollow core secured to the opposite end of the web and upon which the latter is wound, a wire passed loosely through said hollow core, and a receptacle carried by said wire, said receptacle being adapted to catch the drippings falling from the web.

2. A strip of paper coated with sticky fly-catching material, forming a web adapted to fold upon itself, provided with suitable means for suspending the same at one end and having a marginal confining-border for the sticky material, a hollow core secured to the opposite end of the web, a wire passing loosely through said hollow core, and a receptacle mounted upon the wire, said receptacle having a relatively wide open mouth and adapted to catch the flies and drippings falling from the web.

3. A strip of paper coated with sticky fly-catching material forming a web adapted to fold upon itself and provided with a marginal confining-border for the sticky material, a hollow core secured to one end of the web, a wire loop passing loosely through the said hollow core and provided with a hook, and a receptacle for catching the drippings and flies, suspended from said hook, substantially as described.



608,982. POCKET SHOE-BLACKING OUTFIT. LEVI W. WEAVER, Elnora, Ind. Filed Sept. 24, 1897. Serial No. 652,849. (No model.)

Claim.—1. In a device of the character described, the combination with a casing, of a shining-brush, a blacking-brush hinged to the shining-brush, and means for reversibly securing the brushes to the casing, substantially as specified.

2. The combination with a casing provided with longitudinal grooves along the upper edges of its side walls and with transverse grooves along the end edges of said side walls, of a shining-brush, a blacking-brush hinged thereto, flanges extending along the longitudinal edges of the said brushes and designed to engage the longitudinal grooves in the casing, a hinged cover carried by the blacking-brush, a box detachably carried by the cover, and securing mechanism designed to secure the cover over the end of the casing or to secure the same in position to retain the blacking-brush, substantially as specified.

608,983. MEASURING-FAUCET. ERNEST DOERING, Yonkers, N. Y., assignor of three-fourths to William D. Baldwin, same place, and James H. Walling, Brooklyn, N. Y. Filed Mar. 3, 1897. Serial No. 625,631. (No model.)

Claim.—The combination in a measuring-faucet of the upright shell having the taper-bottom, the taper cylindrical valve-case on the side of the taper-bottom sloping from the back forward and having inlet and discharge ports communicating with the measuring-chambers through said bottom, the valve in said case controlling said ports, the registering ratchet-wheel located in an inclosing case on the top of the shell, reciprocating hook-pawl for shifting said wheel cam-headed staff of the pawl, and the laterally-projecting rocking arm of the valve adapted to actuate said staff, said valve-actuating arm and staff of the pawl adapted for registering prior to opening the discharge-port, and the pawl-retracting spring substantially as described.

608,984. BEER-MEASURING FAUCET. ERNEST DOERING, Yonkers, N. Y., assignor of three-fourths to William D. Baldwin, same place, and James H. Walling, Brooklyn, N. Y. Filed Mar. 3, 1897. Serial No. 625,630. (No model.)

Claim.—1. The combination with a faucet of an automatic spring-power-actuated indicator, valve-actuated spring-winder, and valve-actuated controlling-brake for the spring substantially as described.

2. The combination with a faucet of an automatic spring-power-actuated indicator, valve-actuated spring-winder, automatic spring-power-actuated tension-regulator for the spring, and valve-actuated controlling-brake for the spring substantially as described.

3. The combination with a faucet, of an automatic spring-power-actuated indicator, automatic spring-winding apparatus geared with the valve for being actuated thereby, and a spring-power-controlling brake also geared with the valve for release when the valve opens and for application when the valve closes substantially as described.

4. The combination with a faucet, of an automatic spring-power-actuated indicator ratchet-wheel for winding up the spring-pawl, pawl-lever for actuating the ratchet-wheel, and gears connecting the pawl-lever with the valve for actuating it thereby substantially as described.

5. The combination with a faucet, of an automatic spring-power-actuated indicator, ratchet mechanism geared with the valve for winding up the spring, means for disconnecting the actuating-pawl from the ratchet-wheel to limit overtension of the spring, and means for restoring the connection when the tension of the spring relaxes substantially as described.

6. The combination with a faucet, of an automatic spring-power-actuated indicator, ratchet mechanism geared with the valve for winding up the spring, whereof the ratchet-wheel is mounted on a screw-threaded pivot-center for release from the pawl to limit overtension, and said pivot-center is geared with the master-wheel of the spring-power for relaxing overtension of the spring substantially as described.

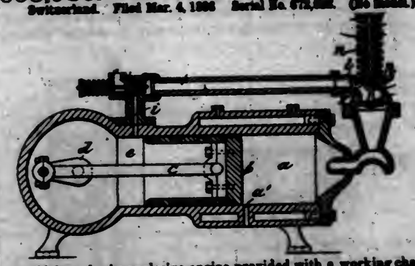
608,985. AUTOMATIC CUT-OFF FOR OIL-TANKS. HIRAM OVIES, JOHN P. KELLY, and AARON KESSEL, Cygnet, Ohio. Filed June 30, 1897. Serial No. 643,404. (No model.)

Claim.—1. In an automatic cut-off for storage-tanks, the combination with a weight and a valve adapted to be operated by the falling of the weight, of means for holding the weight in elevated position, a float within the tank, and means operated by the float to release the weight, substantially as set forth.

2. In an automatic cut-off for storage-tanks, the combination with the valve in the discharge-pipe, of a handle connected to the valve, a float located within the tank, a weight adapted to strike the handle of the valve, and means operated by the float to release the weight, substantially as shown and for the purpose set forth.

3. In an automatic cut-off for storage-tanks, the combination with the valve in the discharge-pipe having a handle, of a float located within the tank, a trip-lever connected to the float, and a weight supported by the bracket and adapted to be struck by the trip-lever, substantially as shown and for the purpose set forth.

4. In an automatic cut-off for storage-tanks, the combination with the valve in the discharge-pipe and handle for operating the same, of a bracket or frame and weight supported thereby, a trip-lever engaging the weight, and a float within the tank connected to the trip-lever, substantially as shown and for the purpose set forth.



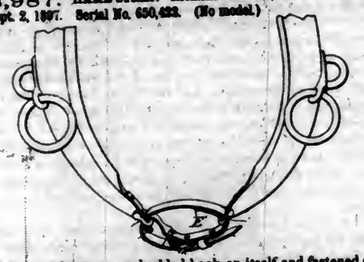
5. In an automatic cut-off for storage-tanks, the combination with the valve in the discharge-pipe and handle connected to the valve, of a bracket supported upon the tank and having guide-rods, a weight mounted upon one of the guide-rods and having a lug engaging the shoulder formed by the lower end of the slot in the bracket, a trip-lever mounted within the bracket to engage the weight, and a float sliding upon the other guide-rod and connected to the trip-lever, substantially as shown and for the purpose set forth.

6. In an automatic cut-off for storage-tanks, the combination with the valve in the discharge-pipe and handle connected to the valve, of a bracket secured to the upper end of the tank and having depending guide-rods, a weight mounted upon one of the guide-rods to strike the handle of the valve, said weight having a lug which engages the bracket, a trip-lever adapted to release the weight, a float located within the tank upon the other guide-rod, and a chain connected to the trip-lever and operated by the float, substantially as shown and for the purpose set forth.

7. In an automatic cut-off for storage-tanks, the combination with the valve in the discharge-pipe and handle connected to the valve, of a bracket supported upon the tank and having guide-rods, a sliding weight mounted upon one of the guide-rods and provided with a lug which engages the bracket, the handle of the valve projecting within the path of the weight, a trip-lever pivoted within the bracket and adapted to release the weight; together with a float located within the tank upon the other guide-rod, said float having a vertical opening through the same, a chain extending from the trip-lever through the opening in the float, and a ring adjustably connected to the chain, substantially as shown and for the purpose set forth.

8. In an automatic cut-off for storage-tanks, the combination with the discharge-pipe and valve, of a handle connected to the plug of the valve and having a bifurcated end, a bracket supported upon the tank and having a guide-rod which depends within the bifurcated end of the handle, a weight sliding upon the guide-rod and having a lug which engages the bracket, a trip-lever pivoted within the bracket and adapted to release the weight, and a float mounted within the tank and connected to the trip-lever, substantially as shown and for the purpose set forth.

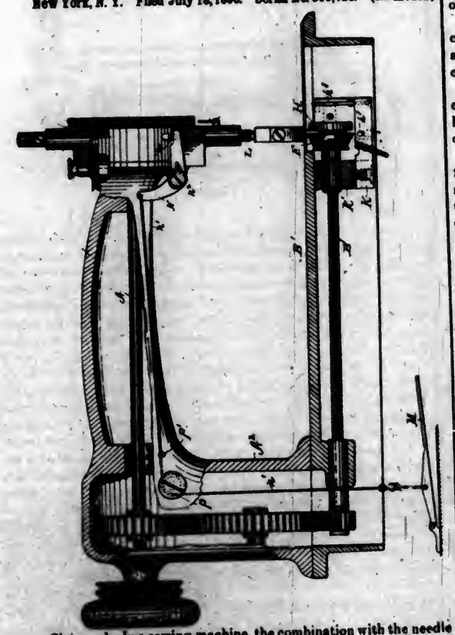
608,986. EXPLOSIVE-ENGINE. CHARLES B. HEBBERD, Berne, Switzerland. Filed Mar. 4, 1896. Serial No. 672,282. (No model.)



Claim.—1. An explosive-engine provided with a working chamber, a piston, a compression-chamber behind the piston, a valve-chamber having an inlet, a passage between the valve-chamber and the working chamber, and a passage-way between the valve-chamber and the compression-chamber, said passage-way being sufficiently constricted to retard the flow of fluid when the speed of the engine passes above the normal, in combination with valves in the valve-chamber, one being arranged to close the inlet during the power stroke of the engine and the other to close the passage from the valve-chamber to the working chamber during the opposite stroke of the engine, whereby the increase in speed of the engine beyond the normal rate will cause a delay in the operation of the valves and a consequent reduction in the charge supplied to the working chamber.

2. An explosive-engine provided with a working chamber, a piston, a compression-chamber behind the piston, a valve-chamber having an inlet, a passage between the valve-chamber and the working chamber, and a passage-way between the valve-chamber and the compression-chamber, said passage-way being sufficiently constricted to retard the flow of fluid when the speed of the engine passes above the normal, in combination with valves in the valve-chamber, one being arranged to close the inlet during the power stroke of the engine and the other to close the passage from the valve-chamber to the working chamber during the opposite stroke of the engine, whereby the amount of air supplied to the working cylinder varies with the speed of the engine, and a fuel-spray valve arranged to be operated by the supply of air to the working cylinder, whereby the quality of the charge is maintained substantially uniform.

3. An explosive-engine provided with a working chamber, a piston, a compression-chamber behind the piston, a valve-chamber having an inlet, a passage between the valve-chamber and the working chamber, and a passage-way between the valve-chamber and the compression-chamber, said passage-way being sufficiently constricted to retard the flow of fluid when the speed of the engine passes above the normal, in combination with valves in the valve-chamber, one being arranged to close the inlet during the power stroke of the engine and the other to close the passage from the valve-chamber to the



working chamber during the opposite stroke of the engine, whereby the amount of air supplied to the working cylinder varies with the speed of the engine, a check-valve in the said passage and arranged to be opened by the air on its way through the passage to the working cylinder, and a fuel-spray valve actuated by the movement of the said check-valve.

603,987. HAME-STRAP. RICHARD GRIBSBY, El Paso, Tex. Filed Sept. 2, 1897. Serial No. 650,422. (No model.)

Claim.—A hame-strap doubled back on itself and fastened so as to form two loops, a metallic hook secured in the outer loop, and a buckle and keeper held by the second loop, whereby the wearing strain is taken off from the main portion of the strap by the hook and looped portion and whereby the strain on the buckle is partially removed, substantially as described.

603,988. SEWING-MACHINE. CHARLES H. WILLCOX, New York, N. Y., CYRUS CARLETON, Providence, R. I., and STOCKTON BOSTON, Brooklyn, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed July 13, 1896. Serial No. 599,723. (No model.)

Claim.—1. In a sewing-machine, the combination with the needle and looper, of a take-up comprising a rotating plate or support, and two crank-pins on opposite sides respectively of said plate or support, substantially as described.

2. In a sewing-machine, a take-up comprising a rotary support and two crank-pins, one on each side of said support, in combination with a thread eye or guide through which the thread is passed between the pins, substantially as described.

3. In a sewing-machine, the take-up, comprising a rotary support and two crank-pins one on each side thereof, one of said pins being nearer the center of the support than the other, substantially as described.

4. In a sewing-machine, the take-up comprising a rotary support and two crank-pins one on each side of the support, and at points nearly diametrically opposite, so as to constitute in operation on the thread a double crank, substantially as described.

5. In a sewing-machine, a take-up comprising three plates, a crank-pin between the middle and inner plates, and a second crank-pin between the middle and outer plates, substantially as described.

6. The combination with the rotary take-up, needle and looper, of a spring for holding the thread taut while the needle is descending, and a cam carried by the take-up for intermittently raising said spring and leaving the thread free, substantially as described.

7. The combination with the cup-shaped rotary hook, of the inclosed bobbin-case provided with plugs inserted at intervals in its periphery or rim, substantially as described.

8. The combination with the cup-shaped rotary hook, of the non-rotating bobbin-case inclosed therein and supported entirely by the hook, said bobbin-case being provided with peripheral plugs of soft or antifriction material, such as leather, projecting a slight distance beyond the metal of the rim thereby preventing contact of the latter with the surface of the hook, substantially as described.

9. The combination with the cup-shaped rotary hook, of the non-rotating bobbin-case having a rim of larger diameter than the body of the case, said rim being provided with oblique cuts or grooves, substantially as and for the purpose set forth.

10. The combination with the needle and the cup-shaped rotary hook, of the inclosed bobbin-case having an annular rim cut away at its upper part to form a space for entrance of the thread into the hook, said rim being undercut on one side of said space forming an overhanging horn, substantially as and for the purpose set forth.

11. The combination with the needle and the cup-shaped rotary hook, of a bobbin-case inclosed in said hook and having an annular rim cut away at its upper part forming a thread-space, said rim being provided on one side of said space with a cut constituting a thread-passage, curving upwardly from the rear of said horn and terminating on the top of the rim, said passage having between it and the path of the hook a thin upright wall or shield, substantially as described.

12. The combination with the needle, the rotary hook, the inclosed bobbin-case, and the bobbin-holder, of a loop-detaining device acting upon the loop between the adjacent surfaces of the bobbin-case and bobbin-holder, substantially as described.

13. The combination with the needle, the rotary hook, the inclosed bobbin-case, and the bobbin-holder, of a floating plate on said holder, and a spring for pressing said plate toward the adjacent face of the bobbin-case, substantially as described.

14. The combination with the needle, the rotary hook, means for imparting to the rotary hook a plurality of revolutions to each reciprocation of the needle, the bobbin-case inclosed in said hook and the bobbin-holder, of a loop-detaining device acting upon the loop of needle-thread between the adjacent surfaces of the bobbin-case and bobbin-holder, substantially as described.

15. The combination with the bobbin-case provided with a hollow sleeve having a split end and an enlargement thereon, of a bobbin having a barrel adapted to fit over said sleeve and to be placed on and removed from the same by compressing the enlarged split end, the bore of said barrel being countersunk to receive said enlargement, substantially as described.

16. The combination with the bobbin-case having a hollow spindle for the bobbin, of a split sleeve fitted within said spindle, and having on its outer end an enlargement or bead, and a bobbin having a barrel countersunk at the end to receive said enlargement or bead, substantially as described.

17. The combination with the bobbin, of a bobbin-case having on its face a tension for the bobbin-thread, and a rim interrupted at the top forming abutments, said case having a thread-slit extending from the rear of the case to the space between said abutments, so that the thread can be led through said slit and space to the tension, substantially as described.

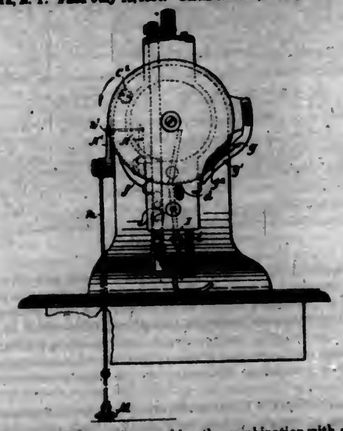
18. The combination with the bobbin, of the bobbin-case, and the tension on the face of said bobbin-case, the latter having a rim interrupted at the top forming abutments overhanging the tension, a thread-slit extending from the rear of the case to the space between said abutments, and adjacent to one of the abutments, and a thread guide or eye adjacent to the other abutment, substantially as described.

19. The combination of the bobbin-case, having a rim interrupted at the top forming a thread-passage and an abutment at one side of said passage, the tension on said bobbin-case, and a spring-tongue forming with said abutment a thread-guide the free end of said tongue pressing against the adjacent surface of the rim to close the thread-guide against the escape of the thread, substantially as described.

20. The combination with the hook-shaft, of the hollow or cup-shaped rotary hook having a hub axially bored for reception of said shaft, the bore extending into the chamber of the hook, and a washer covering the end of the shaft and secured to the rear wall of the hook, substantially as described.

21. In a sewing-machine, and in combination with the needle, take-up, and bobbin-case, of a cup-shaped rotary hook having a slot extending obliquely from the edge toward the rear or base of the cup and forming the hook-point or loop-catcher, and provided with a loop-detaining device in the form of a horn extending part way across said slot, so that the loop will be drawn against and detained by said horn, substantially as described.

22. In a sewing-machine, the combination with the rotary hook having an oil-flange, the hook-shaft having a bearing in the block beneath the bed-plate of the machine, and a bracket attached to said bearing beneath the hook and having a groove or recess to catch the oil thrown from said flange, and an inclined rib or shield extending beyond the sides and bottom of said bracket, substantially as described.



23. In a sewing-machine, the combination with the rotary hook having an oil-flange, the hook-shaft having a bearing in the block beneath the bed-plate of the machine, and a bracket attached to said bearing beneath the hook and having a groove or recess to catch the oil thrown from said flange, and an inclined rib or shield extending beyond the sides and bottom of said bracket, said shield being provided with a drip-angle, substantially as described.

24. In a sewing-machine the combination with the rotary hook having an oil-flange, the hook-shaft having a bearing in the block beneath the bed-plate of the machine, and a bracket attached to said bearing beneath the hook and having a groove or recess to catch the oil thrown from said flange, and an inclined rib or shield extending beyond the sides and bottom of said bracket, said shield having an oblique lower edge and an oblique side intersecting the same, and forming at one side of and beneath the bracket a drip-angle, substantially as described.

25. The combination with the presser-bar having a cross-pin or shoulder, of a bell-crank lever having one arm beneath said pin, a pulley inside the hollow vertical standard at the rear of the machine, a treadle beneath the machine, and a cord running from said lever over said pulley, and vertically through the interior of said standard to said treadle, substantially as described.

26. The combination with the needle-bar, and the shaft, crank and pitman for oscillating said bar, of a counterbalance extending from the shaft in the direction opposite to said crank, and having a projection on the side toward the needle-bar and overhanging said pitman, substantially as described.

603,989. SEWING-MACHINE. CHARLES H. WILLCOX, New York, N. Y., JAMES E. A. GIBBS, Rosslyn, Va., and STOCKTON BOSTON, Brooklyn, N. Y., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed July 13, 1896. Serial No. 599,722. (No model.)

Claim.—1. In a sewing-machine the combination with a needle, a looper and actuating mechanism, of a rotary take-up comprising two plates connected by a take-up pin, thread-guides arranged to conduct the thread across and in proximity to the edges of said plates, and a slack-taking device in the form of a horn projecting from the edge of one of said plates in position to engage the thread, and take up the slack when the take-up is releasing the thread, substantially as described.

2. In a sewing-machine, the combination of the take-up, comprising two plates connected by a crank-pin, a horn or projection on one of said plates for engaging the slack loop given up by the take-up pin, and a stripper or cast-off for releasing the loop from said horn or projection, substantially as described.

3. In a sewing-machine, the combination of a rotary take-up comprising two plates connected by a crank-pin, a thread-guide for leading the thread to the take-up, said guide being in close proximity to the line taken by the thread in leaving the take-up, a horn on the periphery of one of said take-up plates coming into action on the thread passing to said thread-guide after the take-up pin ceases to act, and means for releasing the loop from said horn, substantially as described.

4. The combination of the rotary take-up comprising two plates connected by a crank-pin, a slack-taker, in the form of a horn projecting from the periphery of one of said plates, thread-guides for conducting the thread to the take-up across the path of said horn, and a stripper or cast-off, substantially as described.

5. The combination with a rotary take-up in the head of the machine, said take-up comprising plates and a connecting crank-pin, and with stationary thread-guides in the rear of the head of the machine through which the thread passes to the take-up, of a vibrating thread-controller cooperating with said guides, and a spring actuating said controller whereby the slack thread, when given up by the take-up pin, is drawn back of the head of the machine, substantially as described.

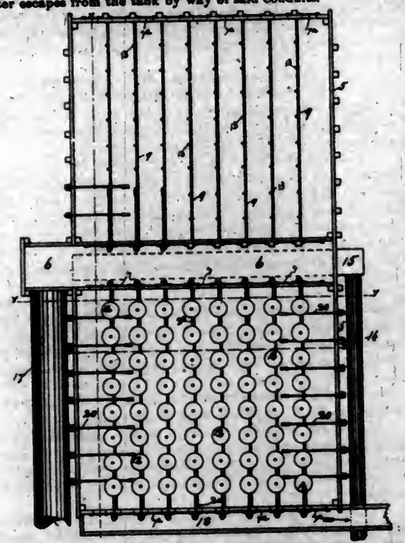
6. The combination with the rotary take-up comprising take-up plates and a crank-pin connecting them, of a thread-controlling device comprising stationary thread-guides through which the thread passes on its way to the take-up, an eye or ring between said guides carried by a pivoted arm, a spring tending to move said arm from between said guides, and a plug or pad of soft material, said arm being provided with an extension which strikes said pad when the arm is actuated by its spring, substantially as described.

7. The combination of the rotary take-up comprising two plates connected by a crank-pin, a horn projecting from the periphery of one of said plates, said plate and horn being grooved, and a stripper or cast-off having its point lying in said groove, substantially as described.

8. The combination of the rotary take-up, the slack-taker coming into action when the take-up is giving out thread, the cast-off for releasing the thread from said slack-taker, and the thread-detainer for putting a drag on the thread when released by the cast-off, substantially as described.

9. The combination of the take-up, the slack-taker for taking up the slack given out by the take-up, the cast-off releasing the thread from the slack-taker, and the thread-detainer having a narrow thread-passage through which the thread passes after being released by the cast-off, substantially as described.

10. The combination of the rotary take-up comprising take-up plates and a crank-pin, a horn projecting from one of said plates intersecting the path of the thread on its way to the take-up, means for releasing the thread from said horn, and a thread-detainer having a narrow thread-passage through which the thread passes after being released from said horn, said passage being provided with an enlargement, substantially as and for the purpose set forth.



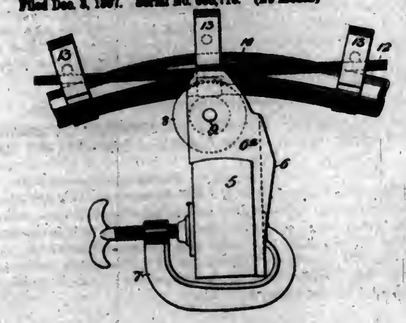
11. In a sewing-machine, the combination with the main shaft and the hook or looper shaft, of mechanism for oscillating the latter shaft at a varying speed so that the looper will move very rapidly when passing through the loop, and very slowly at other times, said mechanism comprising a large eccentric on the main shaft, a short pitman vibrated by said eccentric, a rocking arm vibrated at varying speed by said pitman, said arm being pivoted in the frame adjacent to said eccentric, extending close to the edge thereof and at its opposite end pivoted to said pitman, and connections between said arm and looper-shaft.

12. In a sewing-machine, the combination with the main shaft and looper-shaft, of mechanism for oscillating the latter from the former, said mechanism comprising a rocking arm having a curved limb, a wheel or pulley on said looper-shaft, and bands attached one at each end of said limb and wound in opposite directions around said looper shaft, and means for imparting to said arm a motion of varying speed, substantially as described.

603,990. APPARATUS FOR PURIFYING AND AERATING WATER. CHARLES P. ALLEN, Denver, Colo. Filed Oct. 16, 1897. Serial No. 655,443. (No model.)

Claim.—1. In an apparatus for settling and aerating water, the combination of a suitable tank or box for receiving the water, a flume having openings to allow the water to enter the box, gates controlling said openings, and one or more upright tubes or conduits whose lower extremities are inserted in apertures formed in the bottom of the box, the upper extremities of said tubes or conduits having relatively large mouths into which the top stratum of water is constantly flowing when the apparatus is in use.

3. In a water-settling apparatus, the combination of a suitable box or tank, a flume having openings to allow the water to enter the tank, partitions forming flushing-channels in the bottom of the tank which is provided with one or more outlets for the flushing-water, and suitable upright open-ended conduits attached to the tank and adapted to receive the water from the top of the tank only, which water escapes from the tank by way of said conduits.



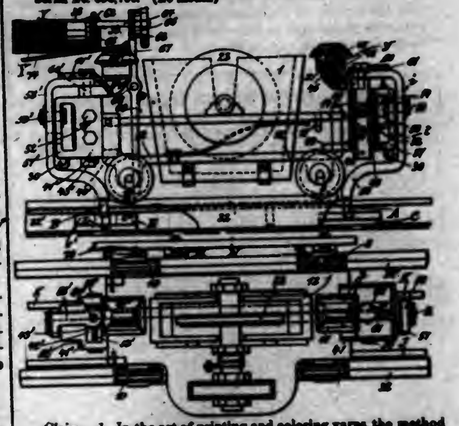
3. The combination with a suitable settling-tank, of one or more aerating-conduits each comprising a tube, a keeper secured to the top of the tube, a relatively large top having a reduced lower part engaging the keeper, set-bolts inserted in threaded apertures in the keeper for locking the said top in any desired position of adjustment, and a packing-ring for forming a water-tight joint between the keeper and the enlarged top of the device.

4. In a settling and aerating apparatus, the combination of a suitable box or tank, a flume having openings to allow the water to enter the tank, gates controlling said openings, partitions located in the tank and forming flushing-channels in the lower part of the tank, the tank having openings for the escape of the flushing-water, gates controlling said openings, aerating-conduits comprising upright tubes, and relatively large mouths adapted to receive the top stratum of water, the lower extremities of said tubes engaging apertures formed in the bottom of the tank, and one or more conduits located underneath the tank for receiving the water from the skimmers.

5. In an apparatus for settling and aerating water, the combination with a suitable tank or box for receiving the water, a flume having an opening to allow the water to enter the box, means for controlling said opening, and one or more conduits whose lower extremities are inserted in apertures formed in the bottom of the box, the upper extremities of said conduits having relatively large mouths.

608,991. CABLE-STRINGER. FRANK A. GARNER, Denver, Colo. Filed Dec. 3, 1897. Serial No. 660,716. (No model.)

Claim.—1. In a cable-stringer, the combination with suitable means for supporting the cable and suspension-wire, of a bracket adapted to be attached to said means, and a roller journaled on said bracket and adapted to engage the cable, the bracket being provided adjacent the roller with a ledge for supporting the suspension-wire.



2. In an aerial cable stringer, the combination with suitable means for supporting the cable and suspension-wire, of a bracket detachably applied to said means and projecting above the same, and a roller journaled in the upper part of the bracket and adapted to engage the cable during the operation of stringing, the bracket being provided with a groove or recess adjacent the roller, to receive the suspension-wire.

3. In an aerial cable-stringer, the combination with means for supporting the cable and suspension-wire, the cable being provided with hooks to engage said wire, of a bracket detachably applied to said supporting means and projecting above the same, a concave-faced roller journaled in the upper part of the bracket and adapted to support the cable during the stringing operation, the bracket being provided adjacent the roller with a groove or recess adapted to receive the suspension-wire, the construction being such that as the cable is drawn over the roller its hooks are disengaged from the suspension-wire, but reengage the same automatically as the hooks leave the roller.

4. In an aerial cable-stringer, the combination with suitable means for supporting the cable and suspension-wire, of a bracket detachably applied to said means, a roller journaled in said bracket and adapted to engage the cable during the operation of stringing, and means located adjacent the roller for supporting the suspension-wire.

5. In an aerial cable-stringer, the combination with suitable means for supporting the cable and suspension-wire, of a roller detachably mounted on said means and projecting above the same, said roller being adapted to support the cable during the operation of stringing, and suitable means located adjacent the roller and adapted to support the suspension-wire in approximately the same plane as the roller.

608,992. METHOD OF AND APPARATUS FOR PRINTING YARNS. CHARLES I. HOLMES, Brooklyn, N. Y. Filed Oct. 20, 1897. Serial No. 656,702. (No model.)

Claim.—1. In the art of printing and coloring yarns, the method herein described of successively applying streaks of color to yarn and partially equalizing the same, which consists in printing such a streak, subjecting during its printing a portion only of its width to rubbing action, then printing another streak and during the printing of the same subjecting a portion of the width of said successive streak and rubbed and unrubbed portions of the previous streak to rubbing actions.

2. In the art of printing and coloring yarns, the method herein described of successively applying streaks of color to the yarn and partially equalizing the same, which consists in printing such a streak, subjecting during its printing a portion only of its width to rubbing action, then printing an adjoining streak and during the printing of the same subjecting a portion of the said successive streak and an adjoining portion of the former streak left unrubbed during the printing of the same and a portion of the former streak rubbed during the printing of the same, to rubbing action.

3. In the art of printing and coloring yarns, the method herein described of successively applying streaks of color to the yarn and partially equalizing the same, which consists in printing such a streak, subjecting during its printing a portion only of its width to rubbing action, then printing an adjoining streak and during the printing of the same subjecting a portion of the said successive streak to rubbing action and simultaneously subjecting a portion of the former streak left unrubbed during the printing of the same to two independent rubbing actions and also subjecting a portion of said former streak previously rubbed to an additional rubbing action.

4. In the art of printing and coloring yarns, the method herein described of successively applying streaks of color to the yarn and partially equalizing the same, which consists in printing such a streak; subjecting during its printing a portion only of its width to rubbing action, then printing an adjoining streak and during the printing of the same subjecting a portion of the width of said successive streak to a rubbing action and simultaneously subjecting a portion of the former streak previously rubbed to an additional rubbing in a direction opposite to that of the previous rubbing.

5. In apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the distributing-wheel, of a support carrying a suitable rubbing-surface, mechanism for shifting said support into varying positions corresponding with varying operative positions of the rubbing-surface and means for enforcing sliding contact between said rubbing-surface and the yarn on the drum.

6. In apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the distributing-wheel, of a support carrying a suitable rubbing-surface, mechanism for shifting said support, and means independent of the color-carriage adapted to lock said support in varying positions corresponding with varying operative positions of the rubbing-surface.

7. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader secured in proper relation with the color-wheel, and means for moving said spreader laterally with reference to the path of the color-wheel.

8. In apparatus for printing yarns, the combination with the color wheel, of a spreader in proper relation thereto, a support for said spreader adapted to move laterally with reference to the path of the color-wheel and secured against up-and-down movement, and means for producing such lateral movement of said support

9. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a support carrying suitable spreading means and mechanism for alternately locking the same in different positions whereby spreading means are applied to the yarn alternately in different positions laterally relative to the path of the color-wheel, and mechanism for shifting the support of the spreader laterally.

10. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of spreading means, and mechanism for alternately producing rubbing-contact between portions of such spreading means and the yarn on the drum in different positions, laterally, relative to the path of the color-wheel.

11. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of spreading means in front and in the rear of the color-wheel and means for applying operative portions of such spreading means to the yarn in varying positions laterally, relative to the color-wheel.

12. In apparatus for printing yarns, the combination with the yarn-drum adapted to be swung step by step and the distributing-wheel, of two sliding spreaders adapted to travel one behind the other and adjusted to have one edge of the forward spreader extend laterally beyond the corresponding edge of the rear spreader and to have the other edge of the rear spreader extend laterally beyond the corresponding edge of the forward spreader, the minimum aggregate widths of the operative surfaces of said spreaders being equal to the peripheral travel of the drum during two successive steps.

13. In apparatus for printing yarns, the combination with the distributing-wheel adapted to apply successive streaks of color to yarn, of two spreaders one overlapping the other and adapted to jointly cover a portion only of the streak in course of application and a portion of previously-printed yarn, and means for holding said spreaders in such positions.

14. In apparatus for printing yarns, the combination with the distributing-wheel adapted to apply successive streaks of color to yarn, of two spreaders, one overlapping the other and adapted to jointly cover a portion only of the streak in course of application and a portion only of the adjoining streak previously printed, and means for holding said spreaders in such positions.

15. In apparatus for printing yarns, the combination with the distributing-wheel adapted to apply successive streaks of a color to yarn, of two spreaders, one overlapping the other and adapted to jointly cover a portion only of the streak in course of application and a portion only of the adjoining streak previously printed, and means for holding said spreaders in such positions.

16. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of two spreaders one overlapping the other, one adapted to cover a portion of the streak in course of application and a portion only of the adjoining streak previously made, and the other adapted to cover a portion only of the previous streak, and means for holding said spreaders in such positions.

17. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of two spreaders adapted to travel one behind the other and adjusted to have one edge of one of said spreaders extend laterally beyond the corresponding edge of the other spreader and means for reversing the relative lateral positions of such edges.

18. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader alined with the path of said wheel, and means for placing it out of alinement therewith.

19. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of two spreaders alined with each other and means for placing the same out of alinement with each other.

20. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of two spreaders placed out of alinement with each other and with the color-wheel, and means for placing said spreaders in alinement with each other and with said wheel.

21. In apparatus for printing yarns, the combination with the yarn-drum and the color-wheel, of a spreader in front of the color-wheel and covering the larger portion of the adjoining streak previously made and a portion of the path to be traversed by the color-wheel while making the streak in course of application, and a spreader in the rear of the color-wheel covering a smaller portion of the adjoining streak previously made and portion of the streak in course of application.

22. In apparatus for printing yarns, the combination with the yarn-drum and the color-wheel, of a spreader, and means for moving the same laterally, such spreader being provided with a laterally-sloping surface extending downward and outward from its contact-surface.

23. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader, a support upon which the same is mounted, and means for producing a parallel movement of said support laterally.

24. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader, a support for said spreader adapted to be moved laterally and provided with suitable recesses, and a spring-catch adapted to engage with such recesses.

25. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader, an upright support for the same, longitudinal grooves in said support, and an elongated spring-actuated projection adapted to engage with said grooves.

26. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader, a support for the same adapted to move laterally, means for producing such movement and a spring for yieldingly resisting the same.

27. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of suitable spreading means, mechanism for alternately applying such means in different operative positions, and a spring adapted to assist such mechanism.

28. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of suitable spreading means, mechanism for alternately applying such means in different positions with reference to said wheel, and springs for yieldingly resisting such movements in either direction.

29. In apparatus for printing yarns, the combination with the color-wheel, of a spreader in proper relation thereto, a sectional support on which said spreader is mounted, and a spring between the sections forming said support, one of the sections being provided with convex surfaces engaging with proper surfaces of the other section.

30. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader capable of lateral movement, a shifting block having a lateral deflecting-surface, a shoe adapted to travel along the same and means for imparting movement from said shoe to said spreader.

31. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader capable of lateral movement, a shifting block having a proper deflecting-surface, and a lever interposed between said block and said spreader.

32. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader capable of lateral movement, a shifting block having a proper deflecting-surface, a lever interposed between said block and said spreader, and means for varying the fulcrumage of said lever.

33. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader capable of lateral movement, a shifting block having a proper deflecting-surface, a shoe adapted to travel along the same, means for imparting movement from said shoe to said spreader, and mechanism for shifting said spreader independent of said shifting block.

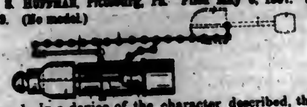
34. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader capable of lateral movement, a shifting block having a proper deflecting-surface, a shoe adapted to travel along the same, means for imparting movement from said shoe to said spreader and mechanism for displacing said shifting block.

35. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader capable of lateral movement, a shifting block for said spreader, and means for displacing said spreader and shifting block simultaneously.

36. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of two spreaders, supports on which said spreaders are mounted, each support having provided for it a pair of shifting blocks at opposite ends of the drum, independent of the shifting blocks for the other spreader, and joint means for displacing two of said shifting blocks.

37. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of two spreaders, proper supports for the same adapted to be moved laterally, and a joint shifting device adapted to simultaneously so move said supports.

38. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of a spreader, two bars joined together and shifting means interposed between said bars and said spreader and adapted to be actuated by each of said bars alternately in different directions.



39. In apparatus for printing yarns, the combination with the revoluble yarn-drum, the color-carriage and a color-distributor, of a locking device for preventing revolving of the drum, comprising gearing in proper engagement with the drum, a brake for locking said gearing, a lever actuating said brake and a tilting device connected with the carriage adapted to engage with said lever.

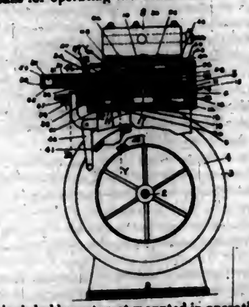
40. In apparatus for printing yarns, the combination with the revoluble yarn-drum, the color-carriage and a color-distributer, of a gearing for revolving the drum, a hand-wheel for actuating said gearing, a gear-wheel on the same shaft with said gear-wheel, levers 67 and 72, connection 74, between the same, and arms on the carriage adapted to engage with said levers.

41. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the distributing-wheel, of a spreader, a suitable support for said spreader, means for moving said support laterally and a drip-pan adapted to move with said support.

42. In apparatus for printing yarns, the combination with the yarn-drum and the distributing-wheel, of mechanism adapted to apply rubbing means to a single streak only, or to two streaks simultaneously.

608,993. DEVICE FOR PREVENTING DISCHARGE OF GAS. ADAM S. HUFFMAN, Pittsburg, Pa. Filed May 6, 1897. Serial No. 635,439. (No model.)

Claim.—1. In a device of the character described, the combination of a gas-tip, a valve therein, a shaft, the upper end of which is provided with outwardly-projecting wings, and the lower end thereof with a weight; a shelf or support for said weighted shaft, and means to connect said shaft and the valve in said tip, substantially as described.



2. In a device of the character described, the combination of a gas-tip having a bell-crank secured in the sides thereof, the said tip being provided with a shelf on the exterior thereof; a valve connected to said bell-crank and adapted to control the opening of said tip: a lever connected to the outer member of said crank; a shaft connected to said lever, the upper end being provided with outwardly-projecting wings, and the lower end with a weight, substantially as described.

608,994. METAL-WORKING MACHINE. NATHANIEL V. PERRY, Falls Church, Va., assignor to the N. V. Perry Manufacturing Company, Hartford, Conn. Filed May 11, 1897. Serial No. 636,081. (No model.)

Claim.—1. A blank-holder, a turret rotatively mounted in operative relation to and with its axis vertically arranged with respect to the axis of the holder and having tool-holding means, means for automatically rotating the turret independent of other movement thereof, and means for varying the degree of rotation of the turret.

2. A blank-holder, a turret rotatively mounted in operative relation to and with its axis vertically arranged with respect to the axis of the holder and having tool-holding means, means for automatically rotating the turret independent of other movement thereof, means for varying the degree of rotation of the turret, and a locking device for holding the turret against rotation.

3. A blank-holder, a turret rotatively mounted in operative relation to and with its axis vertically arranged with respect to the axis of the holder and having tool-holding means, means for automatically rotating the turret independent of other movement thereof, means for varying the degree of rotation of the turret, an index-ring secured to the turret, an index-bolt to engage shoulders on the index-ring, and means for operating the index-bolt.

4. A blank-holder, a turret mounted in operative relation to and with its axis vertically arranged with reference to the axis of the holder and having tool-holding means, means for automatically rotating the turret independent of other movement thereof, means for varying the degree of rotation of the turret, and means for varying the distance between the turret and blank-holder.

5. A blank-holder, a turret mounted in operative relation to and with its axis vertically arranged with respect to the axis of the holder and having tool-holding means, means for automatically rotating the turret independent of other movement thereof, means for varying the degree of rotation of the turret, a locking device for holding the turret during the operation of the tool, and means for varying the distance between the turret and blank-holder.

6. A blank-holder, a turret mounted in operative relation to the holder, a tool held by the turret, means for rotating the turret independent of other movement thereof, means for varying the degree of rotation of the turret, an index-ring secured to the turret, an index-bolt to engage the ring, means for operating the index-bolt, and means for varying the distance between the turret and blank-holder.

7. A turret, means for rotating the turret, a non-rotative friction-band supported in operative relation to the turret, and automatic means for causing the band to bind the turret.

8. A turret, means for rotating the turret, a beveled surface on the turret, a non-rotative friction-band having a beveled surface corresponding to the beveled surface on the turret, and automatic means for causing the band to bind the turret.

9. A rotating turret having a radially-beveled surface, means for rotating the turret, a non-rotative friction-band supported in operative relation to the turret and having a beveled surface corresponding to the beveled surface on the turret, and automatic means for causing the band to bind the turret.

10. A rotating turret having a radially-beveled surface, automatic means for rotating the turret independent of the reciprocating movement of the carriage, a non-rotative friction-band supported in operative relation to the turret and having a beveled surface corresponding to the beveled surface on the turret, an opening through the band, and means for causing the band to bind the turret.

11. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening through the side, a toggle-lug projecting from the band, a sliding yoke, a toggle pivoted to the yoke and toggle-lug, and means for operating the yoke.

12. A turret, means for rotating the turret, a friction band supported in operative relation to the turret and having an opening through the side, a toggle-lug projecting from the band, a sliding yoke, a toggle pivoted to the yoke and toggle-lug, means for operating the yoke, and a stop to limit the movement of the yoke.

13. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening through the side, toggle-lugs projecting from the band, a sliding yoke, toggles pivoted to the yoke and toggle-lugs, means for operating the yoke, and a stop to limit the locking movement of the yoke at a point with the end of the toggles connected with the yoke located at a point beyond a line passing through each of the opposite pivots.

14. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret an opening through the band, a sliding yoke, toggles pivoted to the yoke and to the band on opposite sides of the opening, means for operating the yoke, and a stop to limit the inward movement of the yoke at a point with the ends of the toggles connected to the yoke located beyond a line passing through each of the opposite pivots.

15. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening through the side, a yoke, a toggle pivoted to the band and yoke, a lever operatively connected with the yoke, and means for operating the lever.

16. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening through the side, a yoke, a toggle pivoted to the band and yoke, an index-ring secured to the turret, an index-bolt to engage the index-ring, an index bolt stud secured to the index-bolt and loosely engaging the yoke, and means for operating the index-bolt stud to move the index-bolt and yoke.

17. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret, and having an opening through the side, a yoke, adjusting-screws supported on the yoke, toggles pivoted to the band and adjusting-screws, and means for operating the yoke.

18. A blank-holder, a turret mounted in operative relation to and with its axis vertically arranged with respect to the axis of the holder, a gear in engagement with the turret, a gear operatively connected with the turret-gear, automatic means for intermittently rotating the gears, and means for varying the distance between the blank-holder and turret.

19. A reciprocating carriage, a turret mounted thereon, a cam-wheel bearing cams with means for operating said cam-wheel, and connecting means between the cam-wheel and turret for rotating the latter in any position of the carriage and whether moving or at rest.

20. A support, a turret mounted on the support, a gear engaged with the turret, an internal gear, an intermediate gear interposed between the turret and internal gear, a ratchet secured to the internal gear, and means for operating the ratchet.

21. A support, a turret mounted on the support, a gear engaged with the turret, a ratchet operatively connected with the turret-gear, a pawl arranged to engage the ratchet, a pawl-slide bearing the pawl, and means for reciprocating the pawl-slide.

22. A support, a turret mounted on the support, a gear engaged with the turret, an internal gear, intermediate gears interposed between the turret and internal gear, a ratchet secured to the internal gear, a pawl arranged to engage the ratchet, a pawl-slide bearing the pawl, and means for reciprocating the slide.

23. A support, a shouldered recess within the support, a turret having a beveled flange and located in said recess, a non-rotative friction-band having a beveled surface corresponding with the beveled surface on the turret-flange, a cap overlying the recess and friction-band, means for rotating the turret, and means for operating the friction-band.

24. A reciprocating carriage, a turret mounted on the carriage with its axis vertically arranged, automatic means for rotating the turret independent of the reciprocating movement of the carriage, and means for varying the degree of rotation of the turret.

25. A reciprocating carriage, a turret mounted thereon with its axis vertically arranged, and automatic means for rotating the turret independent of the reciprocating movement of the carriage.

26. A reciprocating carriage, a turret mounted thereon and with its axis vertically arranged, automatic means for rotating the turret independent of the reciprocating movement of the carriage, means for varying the degree of rotation of the turret, and a locking device for holding the turret against rotation.

27. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, means for varying the degree of rotation of the turret, an index-ring secured to the turret, an index-bolt to engage the index-ring, and means for operating the index-bolt.

28. A reciprocating carriage, a turret mounted thereon, automatic means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band supported in operative relation to the turret, and means for causing the band to bind the turret.

29. A reciprocating carriage, a turret mounted thereon and having a beveled surface, means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band having a beveled surface corresponding to the beveled surface on the turret, and automatic means for causing the band to bind the turret.

30. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band supported in operative relation to the turret and having an opening through the side, a toggle-lug projecting from the band, a sliding yoke, a toggle pivoted to the yoke and toggle-lug, means for operating the yoke, and a stop to limit the locking movement of the yoke at a point with that end of the toggle connected with the yoke located at a point beyond a line passing through the opposite toggle-pivot and located at a right angle to the plane of movement of the yoke.

31. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band supported in operative relation to the turret and having an opening through the side, a toggle-lug projecting from the band, a sliding yoke, a toggle pivoted to the lug and yoke, means for operating the yoke, and a stop to limit the locking movement of the yoke.

32. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band supported in operative relation to the turret, an opening through the band, a sliding yoke, toggles pivoted to the yoke and band, a lever operatively connected with the yoke, and means for operating the lever.

34. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band supported in operative relation to the turret and having an opening therethrough, a yoke, toggles pivoted to the band and yoke, an index-ring secured to the turret, an index-bolt to engage the index-ring, an index-bolt stud secured to the index-bolt and loosely engaging the yoke, and means for operating the index-bolt stud to move the index-bolt and yoke.

35. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a friction-band supported in operative relation to the turret and having an opening therethrough, a yoke, adjusting-screws supported on the yoke, toggles pivoted to the band and adjusting-screws, and means for operating the yoke.

36. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a gear engaged with the turret, a gear operatively connected with the turret-gear, and means for rotating the gears.

37. A reciprocating carriage, a turret mounted thereon, means for rotating the turret independent of the reciprocating movement of the carriage, a gear engaged with the turret, a gear for rotating the turret and operatively connected with the turret-gear, a ratchet secured to the turret-rotating gear, and means for operating the ratchet.

38. A reciprocating carriage, a turret mounted on the carriage, a gear engaged with the turret, an internal gear, an intermediate gear interposed between the turret and internal gear, a ratchet secured to the internal gear, and means for operating the ratchet.

39. A reciprocating carriage, a turret mounted thereon, a gear engaged with the turret, a ratchet operatively connected with the turret-gear, a pawl arranged to engage the ratchet, a pawl-slide bearing the pawl, and means for reciprocating the pawl-slide.

40. A reciprocating carriage, a turret mounted on the carriage, a gear engaged with the turret, an internal gear, intermediate gears interposed between the turret and internal gear, a ratchet secured to the internal gear, a pawl arranged to engage the ratchet, a pawl-slide bearing the pawl, and means for reciprocating the slide.

41. A reciprocating carriage, a turret rotatively mounted thereon and having a beveled flange, a non-rotative friction-band having a beveled surface corresponding with the beveled surface on the turret-flange, a cap overlying the friction-band, means for rotating the turret, and means for operating the friction-band.

42. A reciprocating carriage, a turret mounted thereon and having a radially-beveled surface, means for rotating the turret, a band supported in operative relation to the turret and having a beveled surface corresponding with the beveled surface on the turret, means for compressing the band against the turret, a slide continuously connected with the slide-operating means, and means for operating the slide.

43. A reciprocating carriage, a turret mounted on the carriage, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening through the side, toggle-lugs projecting from the band, a sliding yoke, toggles pivoted to the yoke and toggle-lugs, a slide continuously connected with the yoke, and means for operating the slide.

44. A reciprocating carriage, a turret mounted thereon, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening therethrough, a yoke, toggles pivoted to the band and yoke, a slide continuously connected with the yoke, a lever in engagement with the slide, and means for operating the lever.

45. A reciprocating carriage, a turret mounted thereon, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening therethrough, a yoke, toggles pivoted to the band and yoke, an index-ring secured to the tur-

ret, an index-bolt to engage the index-ring, an index-bolt stud secured to the index-bolt and loosely engaging the yoke, an index-stud slide having a groove engaging the index-bolt stud, and means for operating said slide.

46. A reciprocating carriage, a turret mounted on the carriage, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening therethrough, a yoke, adjusting-screws supported on the yoke, toggles pivoted to the band and adjusting-screws, a slide having a groove, a stud located in the groove and connected with the yoke, and means for operating the slide.

47. A turret, means for rotating the turret, a friction-band having an opening through the side and supported in operative relation to the turret, and automatic means for causing the band to bind the turret.

48. A turret, means for rotating the turret, a friction-band supported in operative relation to the turret and having an opening through the side, a yoke, an adjusting-screw supported on the yoke, a toggle pivoted to the band and adjusting-screw, and means for operating the yoke.

49. A support, a turret mounted on the support, a ratchet operatively connected with the turret, a pawl-slide, a pawl mounted thereon, and means for moving the slide toward the ratchet independent of any movement of the turret or turret-carriage.

50. A reciprocating carriage, a turret mounted on the carriage, means for rotating the turret, a friction-band supported in operative relation to the turret, means for causing the band to bind the turret, a slide continuously connected with the band-operating means, and means for operating the slide.

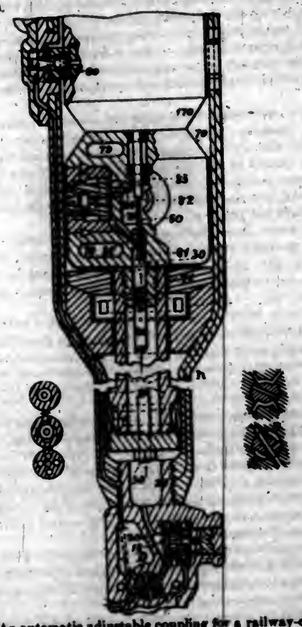
51. A blank-holder, a turret rotatively mounted in operative relation to and with its axis vertically arranged with reference to the axis of the holder and having tool-holding means, and automatic means for rotating the turret independent of other movement thereof.

52. A sliding carriage, a turret rotatively mounted on the carriage, means for rotating the turret, a turret-lock mounted on the carriage, means for operating the turret-lock, and mechanism continually connecting the turret-lock and the locking means.

53. A reciprocating carriage, a turret rotatively mounted on the carriage, means for rotating the turret, and automatic means for locking the turret in any position of the carriage.

54. A reciprocating carriage, a turret rotatively mounted on the carriage and with its axis vertically arranged, and automatic means for rotating the turret in any position thereof and whether moving or at rest.

55. A reciprocating carriage, a turret rotatively mounted on the carriage, automatic means for rotating the turret in any position thereof and whether moving or at rest, and automatic means for locking the turret in any position thereof.



608,995. HANDLE-BAR FOR BICYCLES. GEORGE C. POWELL, Cleveland, Ohio. Filed June 19, 1896. Renewed Feb. 19, 1898. Serial No. 670,973. (No model.)

Claim.—In a handle-bar, the head-post with parallel tubular sockets attached to its upper end and stamped or pressed outwardly to form flutings or corrugations at their front ends as shown, with tubular handle-bars having tubular thimbles attached to their inner ends which thimbles fit within the sockets of the head-post and are also stamped or pressed outwardly to form flutings or corrugations at their front ends to correspond and interlock with the flutings or corrugations of the socket, the rear ends of the thimbles projecting from the sockets and being provided with clamping-nuts which hold the corrugations into engagement, substantially as hereinbefore set forth.

608,996. CAR-COUPLING. ROBERT C. SAYER, Bristol, England. Filed June 14, 1897. Serial No. 640,792. (No model.)

Claim.—1. An automatic adjustable coupling for a railway-carriage consisting of a fixed tube rotatably mounted in bearings, two polygonally-bored heads connected to the ends of the tube by universal tubular joints so as to allow of the heads being adjusted to meet similar heads when coupling and at the same time to form a continuous communication for fluid-pressure and for mechanical rotation, polygonal pistons within the heads, provided with means for attaching to similar heads when coupling, and valves in the heads adapted to be operated by hand and controlling the fluid-pressure to the pistons.

2. An automatic adjustable coupling for a railway-carriage consisting of a fixed tube rotatably mounted in bearings, two polygonally-bored heads connected to the ends of the tube by universal tubular joints so as to allow of the heads being adjusted to meet similar heads when coupling and at the same time to form a continuous communication for fluid-pressure and for mechanical rotation, polygonal pistons within the heads, provided with means for attaching to similar heads when coupling, valves in the heads adapted to be operated by hand and controlling the fluid-pressure to the pistons, laterally-movable bearings for the heads and a means for moving the bearings laterally as the carriage-body varies relatively to the rails so as to automatically adjust the heads to the desired position of the track.

3. An automatic adjustable coupling for a railway-carriage consisting of a fixed tube rotatably mounted in bearings, two polygonally-bored heads connected to the ends of the tube by universal tubular joints so as to allow of the heads being adjusted to meet similar heads when coupling and at the same time to form a continuous communication for fluid-pressure and for mechanical rotation, polygonal pistons within the heads, provided with means for attaching to similar heads when coupling, coupling-recesses in the heads, valves in the heads controlling the pressure to the pistons so that the pistons can be forced outward, radial piston-lugs in the pistons, automatic valves that are opened when the couplings meet similar couplings and act to force out the radial piston-lugs into the recesses, automatic valves in the piston-lugs that connect the tubular communication between the two vehicles, and a chamber with non-return-valve communication with the back of the pistons to withdraw the pistons when the pressure is removed from their front ends.

4. An automatic adjustable coupling for a railway-carriage consisting of a fixed tube rotatably mounted in bearings, two polygonally-bored heads connected to the ends of the tube by universal tubular joints so as to allow of the heads being adjusted to meet similar heads when coupling and at the same time to form a continuous communication for fluid-pressure and for mechanical rotation, polygonal pistons within the heads, provided with means for attaching to similar heads when coupling valves in the heads, a cross-shaft with handles, a lever-arm on the cross-shaft, a sleeve adapted to slide on the tube when operated by the lever-arm, a rack on the sleeve, a pinion on the valve gearing with the rack, a flat on the cross-shaft and a spring-lever forced against the flat on the shaft.

603,997. LUBRICATOR. GUSTAV SEYFFARTH, Philadelphia, Pa. Filed Mar. 5, 1897. Serial No. 626,117. (No model.)

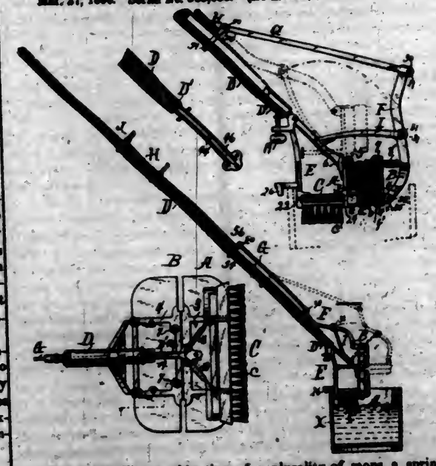
Claim.—1. A lubricating apparatus for hydraulic elevators comprising a hood, adapted to be secured to the end of the piston-rod, a spindle, set in the hood concentrically with the piston, an oil-holder suspended from the spindle, a hub, rotatably set on the spindle, extensible arms secured in the hub, mop-wipers secured to the arms, means for securing the mop-wipers to the arms, brackets secured to the extensible arms, elastic strips secured to the brackets, spoons or ladles secured to the strips, in position to enter the oil-holder for the purpose of supplying oil to the wipers, and means for imparting a rotary motion to the hub.

2. In a lubricating apparatus for hydraulic elevators, the combination with extensible arms, rotatably set on a spindle, secured to the piston, and with wipers secured to the arms, of a stationary oil-holder, suspended from the spindle, of ladles secured to the arms in position to enter the oil-holder for the purpose of supplying oil to the wipers and of means for imparting a rotary motion to the arms.

3. In a lubricating apparatus for hydraulic elevators, the combination with extensible arms rotatably set on a spindle, secured to the piston, ladles and wipers secured to the arms, and a stationary oil-holder, suspended from the spindle in such position that the ladles may enter it for the purpose of supplying oil to the wipers, of an extensible arm, rigidly connected with the other arms, a holder adjustably secured to the arm, a socket set in the holder, a fork set turnably in the socket, means for securing the fork in adjusted position and a friction-roller set in the fork.

4. In a lubricating apparatus for hydraulic elevators, the combination with extensible arms rotatably set on a spindle, secured to the piston, ladles and wipers secured to the arms and a stationary oil-holder, suspended from the spindle in such position that the ladles may enter it for the purpose of supplying oil to the wipers, of an extensible arm, rigidly connected with the other arms, and a friction-roller adjustably secured to the arm.

603,998. AUTOMATIC GAS SHUT-OFF. JOHN BAIRD, Uniontown, Pa. Filed July 12, 1897. Serial No. 644,185. (No model.)



Claim.—1. In an automatic gas cut-off, the combination with a burner, of an arm secured thereto, a lever fulcrumed in said arm and provided with an upwardly-extending arm, a shade upon the upper end of said arm in position to receive the current of heat from the gas in its upward movement to keep the said arm in elevated position and a cap actuated by said arm and adapted to fit over the tip of the burner when the arm of the pivoted lever falls toward the gas-burner, substantially as described and for the purpose set forth.

2. In an automatic gas cut-off, the combination of an angle-arm adjustably secured to the burner, a lever pivoted to the vertical arm of said angle-arm and provided with an arm extending above the gas-burner, and a depending arm provided with an opening near its lower end, a curved arm or wire pivoted to the angle-arm at one end and extending through the opening in said depending arm, said curved arm being provided with a cap or plate adapted to fit over the tip of a gas-burner, a shade at the upper end of the upwardly-extending arm of the pivoted lever adapted to receive the current of heat from the gas and keep the said lever in one position, and means for balancing said lever, substantially as and for the purpose described.

3. In an automatic gas cut-off, the combination with an angle-arm adjustably secured to the gas-burner, of a lever pivoted between the bifurcated ends of said angle-arm, said lever being provided at one end with an eye for the reception of a weighted screw to balance said lever and at the other end with a rod or arm extending above the gas-burner, a depending arm provided with a loop or opening, and an arm or wire passing through said opening and pivoted to the angle-arm at one end and provided with a cap or plate at the other, the upwardly-extending arm of the lever being provided with a shade adapted to be kept elevated by the heat of the gas, substantially as and for the purpose set forth.

603,999. MOP-HEAD. DE LAGY E. BALLAN, Brooklyn, N. Y., assignor, by mesne assignments, to Annie T. Grace, same place. Filed Mar. 27, 1896. Serial No. 585,088. (No model.)

Claim.—1. The combination of a plurality of mops, a spring-hinge therefor, a handle, and a wringing-lever, and a centering-rod pivotally connecting the wringing-lever and the handle, and said wringing-lever and centering-rod being adapted to press the working faces of said mops together, substantially as described.

2. The combination with a plurality of mops, of a hinge consisting of headed rods pivoted to one mop and working through another, and spiral springs between the heads of the rods and the latter mop, substantially as described.

3. The combination with the handle and mops, of a hinge consisting of headed rods pivoted to one mop and working through another, spiral springs between the heads of the rods and the latter mop, a wringing-lever, a centering-lever, and connecting-rods, substantially as described.

4. The combination with a handle and mops, of a hinge consisting of headed rods pivoted to one mop and working through another, spiral springs between the heads of the rods and the latter mop, a wringing-lever, a centering-rod, connecting-rod, and a clutch adapted to engage said handle, substantially as described.

5. The combination of two mops hinged together, a handle attached to one mop, a clutch adapted to engage thereon, a lever attached to the other mop, a connecting-rod from the clutch to said lever, and a centering-rod connected to said lever and to said handle, whereby the working faces of the mops may be pressed together, substantially as described.

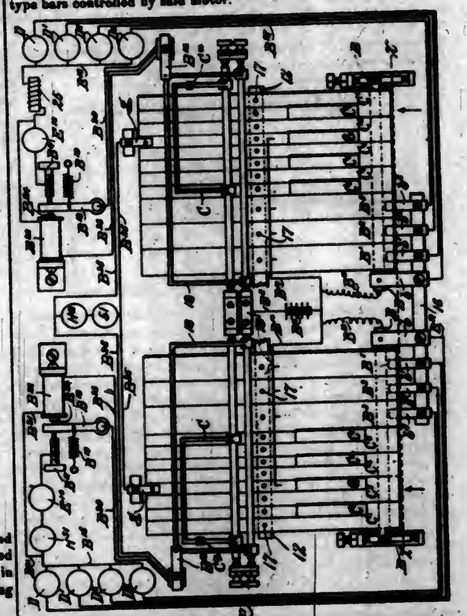
6. The combination with a handle and mop of a casting 3 provided with a jaw, a clamp E provided with a corresponding jaw, a brush within said jaws, an arm adapted to be pivoted on the handle, and an adjusting-screw working in the arm and against the handle and adapted to position said clamp E, substantially as described.

7. A finger-clutch consisting of a body part H provided with a guide-ring which works on a handle, and of spring-actuated arms pivoted on said plate H and normally engaging with the handle, substantially as described.

8. In a mop-head, the combination with the handle, of the wringing-lever F formed of malleable metal, a fork at the end thereof adapted to a pivotal connection with the mop and provided with pivotal pins, a centering-lever I provided with flaring ears at one end adapted to engage the pins of the wringing-lever F and with a goose-neck at the other end adapted to engage said handle, substantially as described.

604,000. BROOM. THADDEUS H. BROWN, Viroqua, Wis. Filed Sept. 9, 1897. Serial No. 651,144. (No model.)

Claim.—1. In a broom, the combination with the handle and straws, of a receptacle designed to receive the straws and provided with a handle-aperture in its bottom, and with a series of notches in its upper edge, and a binding-wire surrounding the broom and passing through the notches, substantially as specified.



2. In a broom, the combination with the straws and handle, of a receptacle designed to receive the straws and provided with a handle-aperture in its bottom and with a series of alternating notches and inwardly-bent pointed projections around its upper edge, and a binding-wire passed around the broom and through the notches, substantially as described.

604,001. TYPE-WRITING MACHINE, &c. THADDEUS CAHILL, New York, N. Y., assignor to James B. Lambie, E. Hilton Jackson, George Frederick Cahill, and Arthur T. Cahill, trustees. Filed June 19, 1897. Serial No. 641,518. (No model.)

Claim.—1. In a type-writing machine, or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (*a*) two sets of type-bars; (*b*) two sets of keys; (*c*) a quick-acting motor device controlled by the keys of one set and serving to impel all the type-bars controlled by said keys, each type-bar as required; and (*d*) a slow-acting motor device controlled by the keys of the other set and serving to impel all the type-bars controlled by such keys, each type-bar as required; the quick-acting motor device and the slow-acting motor device aforesaid having such differing rapidities of action that when keys of the two sets aforesaid are depressed simultaneously, the type-bars brought into action respectively by them print in rapid succession.

2. In a type-writing machine, or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (*a*) two sets of type-bars; the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (*b*) two sets of keys; (*c*) a quick-acting motor device, controlled by the keys of one set and serving to impel all the type-bars controlled by said keys, each type-bar as required; and (*d*) a slow-acting motor device controlled by the keys of the other set and serving to impel all the type-bars controlled by such keys, each type-bar as required; the quick-acting motor device and the slow-acting motor device aforesaid having such differing rapidities of action that when keys of the two sets aforesaid are depressed simultaneously, the type-bars brought into action respectively by them print in rapid succession.

3. In a type-writing machine or other similar instrument an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, in combination, two sets of type-bars; a quick-acting motor, operating to impel all the type-bars of one set; and a slow-acting motor, operating to impel all the type bars of the other set; and permutational character-selecting mechanism for each set of type-bars, whereby the two motors aforesaid are caused each to impel the required type-bar of the set of type bars controlled by said motor.

4. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, in combination, two sets of type-bars; a quick-acting type-bar-controlling mechanism, operating upon the type-bars of one of the sets before mentioned and serving to bring the bars of such set into action individually; and a slow-acting type-bar-controlling mechanism, operating upon the type-bars of the other set, and serving to bring the bars of such set into action individually; one of said type-bar-controlling mechanisms being a permutational type-bar-selecting device, said permutational type-bar-selecting device including (*a*) a motor device whereby all the type-bars of one of the two sets aforesaid are impelled, each type-bar as required; said type-bars being normally disconnected from said motor device; (*b*) keys, whereby the type-bars aforesaid are connected, each type-bar as required, with the motor device aforesaid; and (*c*) a motor-controlling device operated by a plurality of the keys aforesaid and serving to bring the motor device aforesaid into action for the impelling of the type-bar connected with it.

5. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, in combination, two sets of type-bars; a quick-acting type-bar-controlling mechanism, operating upon the type-bars of one of the sets before mentioned and serving to bring the bars of such set into action individually; and a slow-acting type-bar-controlling mechanism operating upon the type-bars of the other set, and serving to bring the bars of such set into action individually; one of said type-bar-controlling mechanisms being a permutational type-bar-selecting device, said permutational type-bar-selecting device, including (*a*) controlling elements, by the cosetting of which the different type-bars aforesaid are brought into action each as required and (*b*) a motor device serving to actuate a plurality of the controlling elements aforesaid, each as required.

6. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, two sets of type-bars; a quick-acting type-bar-controlling mechanism, operating upon the type-bars of one of the sets before mentioned and serving to bring the bars of such set into action individually; and a slow-acting type-bar-controlling mechanism, operating upon the type-bars of the other set, and serving to bring the bars of such set into action individually; one of said type-bar-controlling mechanisms being a permutational type-bar-selecting device, said permutational type-bar-selecting device, including (*a*) controlling elements, by the cosetting of which the different type-bars aforesaid are brought into action each as required;

(*b*) a motor device, serving to actuate a plurality of the controlling elements aforesaid; (*c*) key mechanism, whereby the controlling elements aforesaid are connected, each as required, with the motor device aforesaid.

7. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, in combination, two sets of type-bars; a quick-acting type-bar-controlling mechanism, operating upon the type-bars of one of the sets before mentioned and serving to bring the bars of such set into action individually; and a slow-acting type-bar-controlling mechanism, operating upon the type-bars of the other set, and serving to bring the bars of such set into action individually; one of said type-bar-controlling mechanisms being a permutational type-bar-selecting device, said permutational type-bar-selecting device, including (*a*) controlling elements by the cosetting of which the different type-bars aforesaid are brought into action each as required; (*b*) a motor device serving to actuate a plurality of the controlling elements aforesaid; and (*c*) keys whereby the controlling elements aforesaid are connected, each as required, with the motor device aforesaid, said keys serving also to bring said motor device into action for the impelling of the controlling element connected with it.

8. In a type-writing machine, a set of type-bars striking to a common printing-center; group-controlling devices, each controlling a group of the type-bars aforesaid, a plurality of the type-bars in each group being normally disconnected from the group-controlling device corresponding to them; means whereby the different type-bars of a group are connected with the proper group-controlling device, each as required; a motor, serving for the impelling of all the type-bars above mentioned; and means whereby the different group-controlling devices aforesaid are connected with said motor, each as required; said group-controlling devices being normally disconnected from said motor.

9. In combination, (A) a set of character-corresponding devices; (B) keys, fewer in number than the character-corresponding devices aforesaid; (C) a single motor device controlled by said keys, and acting to operate the character-corresponding devices aforesaid, each as required; and (D) permutational connections intermediate said motor and the character-corresponding devices aforesaid; said permutational connections being controlled by the keys aforesaid.

10. In combination, (A) a set of character-corresponding devices; (B) keys fewer in number than the character-corresponding devices aforesaid; (C) a motor device controlled by a plurality of said keys and acting to operate the character-corresponding devices aforesaid, each as required; and, (D) permutational connections intermediate said motor and the character-corresponding devices aforesaid; said permutational connections being controlled by the keys aforesaid; said keys serving, when depressed, (*a*) to affect the permutational connections intermediate the motor aforesaid and the character-corresponding devices, thereby selecting one of said character-corresponding devices to be actuated, and, (*b*) to bring the motor aforesaid into operation, so that it acts upon said character-corresponding devices.

11. In combination with suitable character-corresponding devices, permutational selecting mechanism, having (*a*) a plurality of controlling elements; and (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned each as required.

12. In combination with suitable character-corresponding devices, permutational selecting mechanism, having (*a*) a plurality of controlling elements; (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required, said controlling elements being normally disconnected from said motor; and (*c*) key mechanism, whereby the controlling elements last above mentioned are connected, each as required, with the motor device aforesaid.

13. In combination with suitable character-corresponding devices, permutational selecting mechanism, having (*a*) a plurality of controlling elements; (*b*) a motor device, serving to actuate a plurality of the controlling elements aforesaid; (*c*) keys, operating to connect the controlling elements last aforesaid, each as required, with the motor device aforesaid; and (*d*) means actuated by the keys aforesaid and serving to bring the motor device aforesaid into operation for the actuating of the controlling elements aforesaid.

14. In combination with suitable character-corresponding devices, permutational character-selecting mechanism having (*a*) controlling elements fewer in number than the character-corresponding devices controlled thereby; and (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required; the controlling elements before mentioned, acting, when moved by the motor device aforesaid to communicate movement to the proper character-corresponding device.

15. In combination with suitable character-corresponding devices, permutational character-selecting mechanism, having (*a*) controlling elements fewer in number than the character-corresponding devices controlled thereby; (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required, said controlling elements being normally disconnected from said motor; and (*c*) key mechanism, whereby the controlling elements last above mentioned are connected, each as required, with the motor device aforesaid; the controlling elements before mentioned, acting, when moved by the motor device aforesaid, to communicate movement to the proper character-corresponding device.

16. In combination with suitable character-corresponding devices, permutational character-selecting mechanism, having (*a*) controlling elements fewer in number than the character-corresponding devices controlled thereby; (*b*) a motor device, serving to actuate a plurality of the controlling elements aforesaid; and (*c*) keys, whereby the controlling elements last aforesaid are connected, each as required, with the motor device aforesaid, said keys serving also to bring said motor device into action for the actuating of the controlling elements aforesaid; the controlling elements before mentioned, acting, when moved by the motor device aforesaid, to communicate movement to the proper character-corresponding device.

17. In a type-writing machine, and in combination therein (A) a set of type-bars arranged in such a manner that they strike to a common printing-center; (B) keys, fewer in number than said type-bars; (C) a single motor device, controlled by said keys and acting to operate the type-bars aforesaid, each as required; and, (D) permutational connections intermediate said motor and the type-bars aforesaid; said permutational connections being controlled by the keys aforesaid.

18. In a type-writing machine, and in combination therein, (A) a set of type-bars arranged in such a manner that they strike to a common printing-center; (B) keys fewer in number than said type-bars; (C) a single motor device controlled by said keys and acting to operate the type-bars aforesaid, each as required; and, (D) permutational connections intermediate said motor and the type-bars aforesaid; said permutational connections being controlled by the keys aforesaid; said keys serving, when depressed, (*a*) to affect the permutational connections intermediate the motor aforesaid and the type-bars aforesaid, thereby selecting one of said type-bars to be actuated, and (*b*) to bring the motor aforesaid into operation, so that it acts upon said type-bar.

19. In a type-writing machine, and in combination therein with the type-bars, arranged to strike to a common printing-center, permutational selecting mechanism, having (*a*) controlling elements fewer in number than the type-bars controlled by them; and (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned.

20. In a type-writing machine, and in combination therein with type-bars, arranged to strike to a common printing-center, permutational selecting mechanism, having (*a*) controlling elements, fewer in number than the type-bars controlled by them; (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required, said controlling elements being normally disconnected from said motor; and (*c*) key mechanism, whereby the controlling elements last above mentioned are connected each as required, with the motor device aforesaid.

21. In a type-writing machine, and in combination therein with type-bars, arranged to strike to a common printing-center, permutational selecting mechanism; having (*a*) controlling elements, fewer in number than the type-bars controlled by them; (*b*) a motor device, serving to actuate a plurality of the controlling elements aforesaid; and (*c*) keys, operating to connect the controlling elements last aforesaid, each as required, with the motor device aforesaid, said keys serving also to bring said motor device into action for the actuating of the controlling elements aforesaid.

22. In a type-writing machine, and in combination therein with type-bars, arranged so that they strike to a common printing-center, permutational character-selecting mechanism, having (*a*) controlling elements fewer in number than the type-bars operated thereby; and (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required; the controlling elements before mentioned acting, when moved by the motor device, to communicate movement to the proper type-bar.

23. In a type-writing machine, and in combination therein with type-bars, arranged so that they strike to a common printing-center, permutational character-selecting mechanism, having (*a*) controlling elements fewer in number than the type-bars operated thereby; (*b*) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required, said controlling elements being normally disconnected from said motor; and (*c*) key mechanism, whereby the controlling elements last above mentioned are connected each as required, with the motor device aforesaid; the controlling elements before mentioned, acting, when moved by the motor device, to communicate movement to the proper type-bar.

24. In a type-writing machine, and in combination therein with type-bars, arranged so that they strike to a common printing-center,

permutational character-selecting mechanism, having (a) controlling elements fewer in number than the type-bars operated thereby; (b) a motor device, serving to actuate a plurality of the controlling elements aforesaid; and (c) keys, whereby the controlling elements last aforesaid are connected, each as required with the motor device aforesaid, said keys serving also to bring said motor device into action for the actuating of the controlling elements aforesaid; the controlling elements before mentioned acting, when moved by the motor device, to communicate movement to the proper type-bar.

25. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, (A) two sets of type-bars, the bars of each set striking to a printing-center common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) type-bar-controlling mechanism serving for the operating of the bars of one of the two sets above mentioned; said type-bar-controlling mechanism including (a) keys, fewer in number than said type-bars; (b) a single motor device controlled by said keys, and acting to operate the type-bars aforesaid, each as required; and, (c) permutational connections intermediate said motor and the type-bars aforesaid; said permutational connections being controlled by the keys aforesaid; and, (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

26. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) type-bar-controlling mechanism serving for the operating of the bars of one of the two sets above mentioned; said type-bar-controlling mechanism including, (a) keys fewer in number than said type-bars; (b), a single motor device controlled by said keys, and acting to operate the type-bars aforesaid, each as required; and, (c) permutational connections intermediate said motor and the type-bars aforesaid; said permutational connections being controlled by the keys aforesaid, said keys serving, when depressed, (1) to affect the permutational connections intermediate the motor aforesaid and the type-bars, thereby selecting one of said type-bars to be actuated, and (2) to bring the motor aforesaid into operation so that it acts upon said type-bar; and, (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

27. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, (A) two sets of type-bars, the bars of each set striking to a printing-center common to the bars of such set, the printing-centers of the two sets of bars being adjacent to each other; (B) type-bar-controlling mechanism serving for the operating of the bars of one of the two sets above mentioned; said type-bar-controlling mechanism including (a) keys, fewer in number than said type-bars; (b) a single motor device controlled by said keys, and acting to operate the type-bars aforesaid, each as required; and, (c) permutational connections intermediate said motor and the type-bars aforesaid: said permutational connections being controlled by the keys aforesaid; and, (C) type-bar-controlling mechanism similar to that last above described, serving to operate the type-bars of the other one of the two sets above mentioned.

28. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) type-bar-controlling mechanism serving for the operating of the bars of one of the two sets above mentioned; said type-bar-controlling mechanism including, (a) keys fewer in number than said type-bars: (b), a single motor device controlled by said keys, and acting to operate the type-bars aforesaid, each as required; and, (c) permutational connections intermediate said motor and the type-bars aforesaid; said permutational connections being controlled by the keys aforesaid; said keys serving, when depressed, (a) to affect the permutational connections intermediate the motor aforesaid and the type-bars, thereby selecting one of said type-bars to be actuated, and, (b) to bring the motor aforesaid into operation so that it acts upon said type-bar: and, (C) type-bar-controlling mechanism similar to that last above described, serving to operate the type-bars of the other one of the two sets above mentioned.

29. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) controlling elements, fewer in number than the type-bars controlled by them; and (b) a motor device serving to actuate a plurality of the controlling elements before mentioned each as required; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

30. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) controlling elements fewer in number than the type-bars controlled by them; (b) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required, said controlling elements being normally disconnected from said motor; and (c) key mechanism whereby the controlling elements last above mentioned are connected each as required, with the motor device aforesaid; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

31. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) permutational selecting mechanism serving for the operating of the bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) controlling elements, fewer in number than the type-bars controlled by them; (b) a motor device serving to actuate a plurality of the controlling elements aforesaid; and (c) keys, operating to connect the controlling elements last aforesaid, each as required, with the motor device aforesaid, said keys serving also to bring said motor device into action for the actuating of the controlling elements aforesaid; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

32. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the bars of one of the two sets before mentioned; said permutational selecting mechanism having; (a) controlling elements fewer in number than the type-bars operated thereby; and (b) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required; the controlling elements before mentioned acting, when moved by the motor device, to communicate movement to the proper type-bar; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

33. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of such set, the printing-points of the two sets of bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) controlling elements fewer in number than the type-bars operated thereby; (b) a motor device, serving to actuate a plurality of the controlling elements before mentioned, each as required, said controlling elements being normally disconnected from said motor; and (c) key mechanism, whereby the controlling elements last above mentioned are connected each as required, with the motor device aforesaid; the controlling elements before mentioned acting, when moved by the motor device, to communicate movement to the proper type-bar; and (C) suitable means for operating the type-bars of the other one of the two sets before mentioned.

34. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the bars of each set striking to a printing-point common to the bars of each set, the printing-points of the two sets of bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) controlling elements fewer in number than the type-bars operated thereby; (b) a motor device, serving to actuate a plurality of the controlling elements aforesaid; and (c) keys, whereby the controlling elements last aforesaid are connected, each as required with the motor device aforesaid, said keys serving also to bring said motor device into action for the actuating of the controlling elements aforesaid; the controlling elements before mentioned acting, when moved by the motor device, to communicate movement to the proper type-bar; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

35. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the type-bars of each set striking to a printing-point common to the type-bars of each set, the printing-points of the two sets of type-bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the type-bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) keys fewer in number than the type-bars controlled thereby; (b) a motor device, common to said type-bars and whereby all said type-bars are actuated, each as required; said type-bars being normally disconnected from said motor device; and (c) means whereby said type-bars are connected with the motor device before mentioned, each as required; said motor device being brought into action by the keys before mentioned, and operating thereupon independently of said keys to impel the type-bar corresponding to the key or combination of keys depressed; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

36. In a type-writing machine, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including (A) two sets of type-bars, the type-bars of each set striking to a printing-point common to the type-bars of such set, the printing-points of the two sets of type-bars being adjacent to each other; (B) permutational selecting mechanism, serving for the operating of the type-bars of one of the two sets before mentioned; said permutational selecting mechanism having (a) keys fewer in number than the type-bars controlled thereby; (b) a motor device, common to said type-bars and whereby all said type-bars are actuated, each as required; said type-bars being normally disconnected from said motor device; (c) means whereby said type-bars are connected with the motor device before mentioned, each as required; and (d) means whereby the keys are arrested; the keys serving when depressed to bring the motor device aforesaid into action; said motor serving after the keys have been depressed and arrested, to impel the type-bar independently of the keys; and (C) suitable means for operating the type-bars of the other one of the two sets above mentioned.

37. In a permutational character-selecting device, (a) a motor; (b) a group of elements adapted to be impelled by said motor, each as required; one of said elements being normally connected with said motor; and (c) means whereby the element before mentioned as being normally connected with the motor aforesaid is disconnected from said motor when any other element of the group of elements before mentioned is connected with said motor.

38. In a permutational character-selecting device, (a) a motor; (b) a group of elements adapted to be impelled by said motor, each as required; one of said elements being normally connected with said motor; (c) key mechanism whereby the other elements of the group of elements aforesaid are connected with the motor aforesaid, each as required; and (d) means whereby the element before mentioned as being normally connected with the motor aforesaid is disconnected from said motor when one of the other elements of the group of elements aforesaid is connected with said motor.

39. In a permutational character-selecting device, (a) a motor; (b) a group of elements adapted to be impelled by said motor, each as required; one of said elements being normally connected with said motor; (c) keys whereby the other elements of the group aforesaid are connected with the motor aforesaid, each as required; and (d) means operated by said keys and serving to break the connection between the motor aforesaid and that one of the elements before mentioned as being normally connected with said motor.

40. A permutational character-selecting mechanism, having (a) a plurality of controlling elements; and (b) a motor serving to actuate all said controlling elements, each as required; one of the controlling elements aforesaid being normally adapted to be operated by the motor aforesaid.

41. A permutational character-selecting mechanism, having (a) a plurality of controlling elements; (b) a motor serving to actuate all said controlling elements, each as required; one of the controlling elements aforesaid being normally adapted to be operated by the motor aforesaid; and (c) means whereby the controlling element before mentioned as being normally adapted to be operated by the motor aforesaid, is prevented from being operated thereby when any of the other controlling elements aforesaid is operated by said motor.

42. A permutational character-selecting mechanism, having (a) a plurality of controlling elements; (b) a motor serving to actuate all said controlling elements, each as required; one of the controlling elements aforesaid being normally adapted to be operated by the motor aforesaid; (c) key mechanism whereby the other controlling elements before mentioned are connected, each as required, with the motor aforesaid; and (d) means whereby the controlling element before mentioned as being normally adapted to be operated by the motor aforesaid is prevented from being operated thereby when any of the other controlling elements before mentioned is connected with the motor aforesaid.

43. A permutational character-selecting mechanism, having (a) a plurality of controlling elements; (b) a motor serving to actuate all said controlling elements, each as required; one of the controlling elements aforesaid being normally adapted to be operated by the motor aforesaid; (c) keys, whereby the other controlling elements before mentioned are connected, each as required, with the motor aforesaid; and (d) means operated by said keys, whereby the controlling element before mentioned as being normally adapted to be operated by the motor aforesaid, is prevented from being operated thereby when any of the other controlling elements before mentioned is connected with the motor aforesaid.

44. In combination, (a) a plurality of groups of character-corresponding devices; (b) a motor: (c) a group of elements, adapted to be impelled by said motor, each element as required; each of said elements controlling one of the groups of character-corresponding devices above mentioned; one of said elements being normally connected with said motor; and (d) means whereby the element before mentioned as being normally connected with the motor aforesaid, is disconnected from said motor when any other element of the group of elements before mentioned is connected with said motor.

45. In combination, (a) a plurality of groups of character-corresponding devices; (b) a motor; (c) a group of elements adapted to be impelled by said motor, each element as required; each of said elements controlling one of the groups of character-corresponding devices above mentioned; one of said elements being normally adapted to be operated by the motor aforesaid; (d) keys acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; and (e) means whereby the element before mentioned as being normally adapted to be operated by the motor aforesaid, is prevented from being operated by said motor, when any other element of the group of elements before mentioned is connected with said motor.

46. In combination, (a) a plurality of groups of character-corresponding devices; (b) a motor; (c) a group of elements adapted to be impelled by said motor, each element as required; each of said elements controlling one of the groups of character-corresponding devices above mentioned; one of said elements being normally connected with said motor; (d) keys, acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; and (e) means controlled by said keys and serving to break the connection between the motor aforesaid and that one of the elements before mentioned as being normally connected with said motor.

47. In combination, (a) a plurality of groups of character-corresponding devices; (b) a motor; (c) a group of elements adapted to be impelled by said motor, each element as required; each of said elements controlling one of the groups of character-corresponding devices above mentioned; one of said elements being normally connected with the motor aforesaid; (d) keys, acting to connect the other elements of the group of elements aforesaid, with the motor aforesaid, each as required; (e) means whereby the element before mentioned as being normally connected with the motor aforesaid is disconnected from said motor, when any other element of the group of elements before mentioned is connected with said motor; and (f) keys, acting to connect the different elements of the group above mentioned with the different character-corresponding devices which they respectively control.

48. In combination, (a) a plurality of groups of character-corresponding devices; (b) a motor; (c) a group of elements, adapted to be impelled by said motor, each element as required; each of said elements controlling the action of one of the groups of character-corresponding devices above mentioned; one of said elements being normally connected with the motor aforesaid; (d) keys, acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; (e) means controlled by the keys before mentioned and serving to break the connection between the motor aforesaid and that one of the elements before mentioned as being normally connected with said motor; and (f) keys, acting to connect the different elements of the group above mentioned with the different character-corresponding devices which they respectively control.

49. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, (a) a motor: (b) a group of elements adapted to be impelled by said motor, each as required; one of said elements being normally connected with said motor, and (c) means whereby the element before mentioned as being normally connected with the motor aforesaid is disconnected from said motor when any other element of the group of elements before mentioned is connected with said motor.

50. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, (a) a motor; (b) a group of elements adapted to be impelled by said motor, each as required; one of said elements being normally connected with said motor; (c) key mechanism whereby the other elements of the group of elements aforesaid are connected with the motor aforesaid, each as required; and (d) means whereby the element before mentioned as being normally connected with the motor aforesaid is disconnected from said motor when any other element of the group of elements before mentioned is connected with said motor.

the motor aforesaid, each as required; and (*d*) means whereby the element before mentioned as being normally connected with the motor aforesaid is disconnected from said motor when one of the other elements of the group of elements aforesaid is connected with said motor.

51. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, (*a*) a motor: (*b*) a group of elements adapted to be impelled by said motor, each as required; one of said elements being normally connected with said motor; (*c*) keys whereby the other elements of the group aforesaid are connected with the motor aforesaid, each as required; and (*d*) means operated by said keys, and serving to break the connection between the motor aforesaid and that one of the elements before mentioned as being normally connected with said motor.

52. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, (*a*) a group of controlling elements; and (*b*) a single motor serving to actuate all the controlling elements of the group aforesaid, each controlling element as required; one of the controlling elements of the group aforesaid being normally adapted to be operated by the motor aforesaid.

53. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, (*a*) a group of controlling elements; (*b*) a motor serving to actuate all the controlling elements of the group aforesaid, each controlling element as required; one of the controlling elements of the group aforesaid being normally adapted to be operated by the motor aforesaid; and, (*c*) means whereby the controlling element before mentioned as being normally adapted to be operated by the motor aforesaid, is prevented from being operated thereby when any other controlling element of the same group is operated by said motor.

54. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, ( ) a group of controlling elements; (*b*) a motor serving to actuate all the controlling elements of the group aforesaid, each controlling element as required; one of the controlling elements of the group aforesaid being normally adapted to be operated by the motor aforesaid; (*c*) key mechanism whereby the other controlling elements of the group before mentioned are connected, each as required, with the motor aforesaid; and (*d*) means whereby the controlling element before mentioned as being normally adapted to be operated by the motor aforesaid is prevented from being operated thereby when one of the other controlling elements of the group aforesaid is connected with the motor aforesaid.

55. In a type-writing machine, and in combination therein with a set of type-bars arranged in such a manner that they strike to a common printing-center, a permutational type-bar-selecting mechanism, including, (*a*) a group of controlling elements; (*b*) a motor, serving to actuate all the controlling elements of the group aforesaid, each controlling element as required; one of the controlling elements of the group aforesaid being normally adapted to be operated by the motor aforesaid; (*c*) keys, whereby the other controlling elements of the group before mentioned are connected, each as required, with the motor aforesaid; and (*d*) a frame, operated by said keys, whereby the controlling element before mentioned as being normally adapted to be operated by the motor aforesaid, is prevented from being operated thereby when one of the other controlling elements of the group aforesaid, is connected with the motor aforesaid.

56. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars, (*b*) a motor; (*c*) a group of elements adapted to be impelled by said motor, each element as required, each of said elements controlling one of the groups of type-bars above mentioned; one of said elements being normally connected with said motor; and (*d*) means whereby the element above mentioned as being normally connected with the motor aforesaid is disconnected from said motor, when any other element of the group of elements before mentioned is connected with said motor.

57. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor; (*c*) a group of elements adapted to be impelled by said motor, each element as required; each of said elements controlling one of the groups of type-bars above mentioned; one of said elements being normally adapted to be operated by said motor; (*d*) keys, acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; and (*e*) means whereby the element above mentioned as being normally adapted to be operated by the motor aforesaid is prevented from being operated by said motor when any other element of the group of elements before mentioned is connected with said motor.

58. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars, (*b*) a motor; (*c*) a group of elements adapted to be impelled by said motor, each element as required, each of said elements controlling one of the groups of type-bars above mentioned; one of said elements being normally connected with the motor aforesaid; (*d*) keys, acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; and (*e*) means controlled by said keys, serving to break the connection between the motor aforesaid, and that one of the elements before mentioned as being normally connected with said motor.

59. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, (*b*) a motor; (*c*) a group of elements adapted to be impelled by said motor, each element as required, each of said elements controlling one of the groups of type-bars above mentioned; one of said elements being normally connected with the motor aforesaid; (*d*) keys, acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; (*e*) means, whereby the element above mentioned as being normally connected with the motor aforesaid is disconnected from said motor when any other element of the group of elements before mentioned is connected with said motor and (*f*) keys, acting to connect the different elements of the group above mentioned with the different type-bars which they respectively control.

60. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor; (*c*) a group of elements adapted to be impelled by said motor, each element as required, each of said elements controlling one of the groups of type-bars above mentioned; one of said elements being normally connected with the motor aforesaid; (*d*) keys, acting to connect the other elements of the group of elements aforesaid with the motor aforesaid, each as required; (*e*) means, controlled by said keys and serving to break the connection between the motor aforesaid and that one of the elements which is before mentioned as being normally connected with said motor; and (*f*) keys, acting to connect the different elements of the group above mentioned with the different type-bars which they respectively control.

61. In a permutational character-selecting mechanism, (*a*) a frame or lever; (*d*) a group of elements adapted to be set in motion by said frame or lever; one of said elements being normally connected with said frame or lever, and (*c*) means whereby the element before mentioned as being normally connected with the frame or lever aforesaid, is disconnected from said frame or lever when any other element of the group of elements before mentioned is connected with said frame or lever.

62. In a permutational character-selecting mechanism, (*a*) a frame or lever; (*b*) a group of elements adapted to be set in motion by said frame or lever; one of said elements being normally connected with said frame or lever; (*c*) keys, whereby the other elements of the group aforesaid are connected with the frame or lever aforesaid, each element as required; and, (*d*) means whereby the element before mentioned as being normally connected with the frame or lever aforesaid, is disconnected from said frame or lever when any other element of the group of elements before mentioned is connected with said frame or lever.

63. In a permutational character-selecting mechanism, (*a*) a frame or lever; (*b*) a group of elements adapted to be set in motion by said frame or lever; one of said elements being normally connected with said frame or lever; (*c*) keys whereby the other elements of the group aforesaid are connected with the lever or frame aforesaid, each element as required; (*d*) means whereby the element before mentioned as being normally connected with the frame or lever aforesaid is disconnected from said frame or lever, when any other element of the group of elements before mentioned is connected with said frame or lever; and (*e*) means controlled by the keys aforesaid and serving to control the movements of the frame or lever before mentioned.

64. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of the group of character-corresponding devices aforesaid; and (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, each as required, thereby to operate the character-corresponding devices aforesaid.

65. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of the groups of character-corresponding devices aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices; and (*d*) keys, acting to connect the different elements above mentioned as each controlling one of the groups of character-corresponding devices aforesaid with the frame or lever aforesaid, each element as required; said keys acting also to control the movements of the frame or lever aforesaid.

66. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements, each controlling one of the groups of character-corresponding devices aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above

mentioned, thereby to operate the character-corresponding devices aforesaid; (*d*) keys, acting to connect the different elements above mentioned as each controlling one of the groups of character-corresponding devices aforesaid with the frame or lever aforesaid, each element as required; and (*e*) a motor device, controlled by said keys and serving, when said keys are acted upon, to impel the frame or lever before mentioned.

67. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of the groups of character-corresponding devices aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices; (*d*) keys acting to connect the different elements above mentioned as each controlling one of the groups of character-corresponding devices aforesaid, with the frame or lever aforesaid, thereby to operate the character-corresponding devices; said keys acting also to control the movements of the frame or lever aforesaid; and (*e*) keys controlling the action of the different elements above mentioned upon the different character-corresponding devices which they respectively control.

68. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements, each controlling one of the groups of character-corresponding devices aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices; (*d*) keys, acting to connect the different elements above mentioned as each controlling one of the groups of character-corresponding devices aforesaid, with the frame or lever aforesaid, each element as required; and (*e*) keys, controlling the action of the different elements above mentioned upon the different character-corresponding devices which they respectively control.

69. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a group of elements each controlling one of said groups of character-corresponding devices; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices aforesaid; one of said elements being normally connected with said frame or lever; and (*d*) keys, whereby the other elements of the group of elements aforesaid, are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever.

70. In combination, (*a*) a plurality of groups of character-corresponding devices, (*b*) a group of elements each controlling one of said groups of character-corresponding devices; (*c*) a frame or lever serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices aforesaid; one of said elements being normally connected with said frame or lever; (*d*) keys, whereby the other elements of the group of elements aforesaid, are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever; and (*e*) a motor device, controlled by said keys and serving, when said keys are acted upon, to impel the frame or lever aforesaid.

71. In combination, (*a*) a plurality of groups of character-corresponding devices, (*b*) a group of elements, each controlling one of said groups of character-corresponding devices; (*c*) a frame or lever serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices aforesaid; one of said elements being normally connected with said frame or lever; (*d*) keys, whereby the other elements of the group of elements aforesaid are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever; and (*e*) keys controlling the action of the different elements above mentioned upon the different character-corresponding devices which they respectively control.

72. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a group of elements, each controlling one of the groups of character-corresponding devices; (*c*) a frame or lever serving to communicate movement to the elements last above mentioned, thereby to operate the character-corresponding devices aforesaid; one of said elements being normally connected with said frame or lever; (*d*) keys, whereby the other elements of the group of elements aforesaid, are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever; (*e*) a motor device controlled by said keys and serving when said keys are acted upon to impel the frame or lever aforesaid; and (*f*) keys, controlling the action of the elements of the group above mentioned upon the different character-corresponding devices which they respectively control.

73. In combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common center; (*b*) a plurality of elements, each controlling one of the groups of type-bars aforesaid; and (*c*) a frame or lever, serving to communicate movement to the elements above mentioned, each element as required, thereby to operate the type-bars aforesaid.

74. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a plurality of elements each controlling one of the groups of type-bars aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-bars aforesaid, and (*d*) keys acting to connect the different elements above mentioned as each controlling one of the group of type-bars aforesaid, with the frame or lever aforesaid, each element as required; said keys acting also to control the movements of the frame or lever aforesaid.

75. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a plurality of elements, each controlling one of the groups of type-bars aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-bars aforesaid; (*d*) keys, acting to connect the different elements last above mentioned as each controlling one of the groups of type-bars aforesaid with the frame or lever aforesaid, each element as required; and (*e*) a motor, controlled by said keys and serving when said keys are acted upon to impel the frame or lever before mentioned.

76. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a plurality of elements each controlling one of the groups of type-bars aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-bars aforesaid; (*d*) keys, acting to connect the different elements above mentioned as each controlling one of the groups of type-bars aforesaid with the frame or lever aforesaid, each element as required; said keys acting also to control the movements of the frame or lever aforesaid, and (*e*) keys, controlling the action of the different elements last above mentioned upon the type-bars which they respectively control.

77. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a plurality of elements each controlling one of the groups of type-bars aforesaid; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-bars aforesaid; (*d*) keys acting to connect the different elements last above mentioned as each controlling one of the groups of type-bars aforesaid with the frame or lever aforesaid, each element as required; (*e*) a motor, controlled by said keys and serving when said keys are acted upon to impel the frame or lever before mentioned; and (*f*) keys controlling the action of the different elements last above mentioned upon the type-bars, which they respectively control.

78. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a group of elements each controlling one of said groups of type-bars; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-bars aforesaid, one of said elements being normally connected with said frame or lever; and (*d*) keys whereby the other elements of the group of elements aforesaid are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever.

79. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a group of elements each controlling one of said groups of type-bars; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-bars aforesaid, one of said elements being normally connected with said frame or lever; (*d*) keys, whereby the other elements of the group of elements aforesaid are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever; and (*e*) a motor, controlled by said keys and serving when the keys are acted upon to impel the frame or lever aforesaid.

80. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a group of elements each controlling one of said groups of type-bars; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned, thereby to operate the type-

bars aforesaid, one of said elements being normally connected with said frame or lever; (*d*) keys, whereby the other elements of the group of elements aforesaid, are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever; and (*e*) keys, controlling the action of the elements of the group above mentioned upon the different type-bars which they respectively control.

81. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a group of elements, each controlling one of said groups of type-bars; (*c*) a frame or lever, serving to communicate movement to the elements last above mentioned thereby to operate the type-bars aforesaid, one of said elements being normally connected with said frame or lever; (*d*) keys, whereby the other elements of the group of elements aforesaid, are connected with the frame or lever aforesaid, each element as required; the element above mentioned as being normally connected with the frame or lever aforesaid, being disconnected from said frame or lever when any other element of the same group is connected with said frame or lever; (*e*) a motor, controlled by said keys and serving when the keys are acted upon to impel the frame or lever aforesaid; and (*f*) keys, controlling the action of the elements of the group above mentioned upon the different type-bars which they respectively control.

82. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of said groups of character-corresponding devices; (*c*) a frame or lever, acting to give movement to the controlling elements aforesaid, each as required, thereby to actuate the character-corresponding devices; (*d*) a plurality of keys; (*e*) a plurality of tilting pieces connected with the controlling elements before mentioned and controlled by the keys; said tilting pieces lying normally out of the path of movement of the frame or lever aforesaid; each key serving when depressed to move the tilting piece controlled by it into the path of movement of the frame or lever aforesaid.

83. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of said groups of character-corresponding devices, and hereinafter in this paragraph termed "controlling elements;" (*c*) a frame or lever, acting to give movement to the controlling elements aforesaid, each as required, thereby to actuate the character-corresponding devices; (*d*) a plurality of keys; (*e*) a plurality of tilting pieces connected with the controlling elements before mentioned and controlled by the keys, said tilting pieces lying normally out of the path of movement of the frame or lever aforesaid; each key serving when depressed to move the tilting piece controlled by it into the path of movement of the frame or lever aforesaid; said keys controlling the movement of said frame or lever.

84. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements, each controlling one of said groups of character-corresponding devices and hereinafter in this paragraph termed "controlling elements," (*c*) a frame or lever acting to give movement to the controlling elements aforesaid, each element as required, thereby to actuate the character-corresponding devices; (*d*) a plurality of keys; (*e*) a plurality of tilting pieces, connected with the controlling elements before mentioned and controlled by the keys, said tilting pieces lying normally out of the path of movement of the frame or lever aforesaid, each key serving when depressed to move the tilting piece controlled by it into the path of movement of said frame or lever; and (*f*) a motor, controlled by said keys and serving to actuate the frame or lever aforesaid.

85. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of said groups of character-corresponding devices, and hereinafter in this paragraph termed "controlling elements;" (*c*) a frame or lever, acting to give movement to the controlling elements aforesaid, each element as required, thereby to actuate the character-corresponding devices; (*d*) a plurality of keys; (*e*) a plurality of tilting pieces connected with the controlling elements before mentioned and controlled by the keys; said tilting pieces lying normally out of the path of movement of the frame or lever aforesaid; each key serving when depressed to move the tilting piece controlled by it into the path of movement of said frame or lever; and (*f*) other keys controlling the action of the controlling elements aforesaid upon the different character-corresponding devices which they respectively control.

86. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements, each controlling one of said groups of character-corresponding devices and hereinafter in this paragraph termed "controlling elements;" (*c*) a frame or lever, acting to give movement to the controlling elements aforesaid, each element as required, thereby to actuate the character-corresponding devices; (*d*) tilting pieces connected with the controlling elements before mentioned, one of said tilting pieces being normally adapted to be impelled by the frame or lever aforesaid: and (*e*) keys whereby the other tilting pieces are connected, each as required, with the frame or lever aforesaid; that tilting piece before mentioned as being normally adapted to be impelled by the frame or lever aforesaid, being prevented from being impelled by said frame or lever when any other tilting piece is connected with said frame or lever.

87. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of said groups of character-corresponding devices, and hereinafter in this paragraph termed "controlling elements;" (*c*) a frame or lever, acting to give movement to the controlling elements aforesaid, each element as required, thereby to actuate the character-corresponding devices; (*d*) tilting pieces connected with the controlling elements before mentioned, one of said tilting pieces being normally adapted to be impelled by the frame or lever aforesaid; and (*e*) keys whereby the other tilting pieces are connected, each as required, with the frame or lever aforesaid; that tilting piece before mentioned as being normally adapted to be impelled by the frame or lever aforesaid being prevented from being impelled by said frame or lever when any other tilting piece is connected with said frame or lever; and (*f*) a motor, controlled by said keys and serving to actuate the frame or lever aforesaid.

88. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements each controlling one of said groups of character-corresponding devices and hereinafter in this paragraph termed "controlling elements;" (*c*) a frame or lever acting to give movement to the controlling elements aforesaid, each element as required, thereby to actuate the character-corresponding devices aforesaid; (*d*) tilting pieces connected with the controlling elements before mentioned, one of said tilting pieces being normally adapted to be impelled by the frame or lever aforesaid. (*e*) keys, whereby the other tilting pieces are connected, each as required, with the frame or lever aforesaid; that tilting piece before mentioned as being normally adapted to be impelled by the frame or lever aforesaid, being prevented from being impelled by said frame or lever when any other tilting piece is connected with said frame or lever; and (*f*) other keys controlling the action of the elements aforesaid upon the different character-corresponding devices which they respectively control.

89. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a plurality of elements, each controlling one of said groups of character-corresponding devices and hereinafter in this paragraph termed "controlling elements;" (*c*) a frame or lever, acting to give movement to the controlling elements aforesaid, each element as required, thereby to actuate the character-corresponding devices; (*d*) tilting pieces connected with the controlling elements before mentioned, one of said tilting pieces being normally adapted to be impelled by the frame or lever aforesaid; (*e*) keys whereby the other tilting pieces are connected, each as required, with the frame or lever aforesaid, that tilting piece before mentioned as being normally adapted to be impelled by the frame or lever aforesaid being prevented from being impelled by said frame or lever when any other tilting piece is connected with said frame or lever; (*f*) a motor, controlled by said keys and serving to actuate the frame or lever aforesaid; and (*g*) other keys, controlling the action of the controlling elements aforesaid upon the different character-corresponding devices which they respectively control.

90. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid, said element being normally disconnected from said motor; said key acting, when depressed, to connect said element with said motor; and (*e*) means whereby said element is connected with the different character-corresponding devices of the group before mentioned, each as required.

91. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid, said element being normally disconnected from said motor, said key acting when depressed to connect said element with said motor; and (*e*) key mechanism, whereby said element is connected with the different character-corresponding devices of the group before mentioned, each as required.

92. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid; the key before mentioned acting when depressed both to connect the element aforesaid with the motor aforesaid and to bring said motor into action, so that it gives movement to said element; and (*e*) means whereby said element is connected with the different character-corresponding devices of the group before mentioned, each as required.

93. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key, controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid; the key before mentioned acting when depressed both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action, so that it gives movement to said element, and (*e*) key mechanism, whereby said element is connected with the different character-corresponding devices of the group before mentioned, each as required.

94. In a type-writing machine, and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid, said element being normally disconnected from said motor; said key acting, when depressed, to connect said element with said motor; and (*e*) means whereby said element is connected with the different type-bars of the group before mentioned, each as required.

95. In a type-writing machine, and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and by the motor aforesaid, said element being normally disconnected from said motor; said key acting when depressed to connect said element with said motor; and (*e*) key mechanism, whereby said element is connected with the different type-bars of the group before mentioned, each as required.

96. In a type-writing machine and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid; the key before mentioned acting, when depressed, both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action, so that it gives movement to said element; and (*e*) means whereby said element is connected with the different type-bars of the group before mentioned, each as required.

97. In a type-writing machine and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid, the key before mentioned acting, when depressed, both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action, so that it gives movement to said element; and (*e*) key mechanism, whereby said element is connected with the different type-bars of the group before mentioned, each as required.

98. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid, said element being normally disconnected from said motor; said key acting when depressed to connect said element with said motor and (*e*) a member continuously in operative relation to the element above mentioned and movable to connect said element with the different character-corresponding devices of the group before mentioned, each as required.

99. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor: (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid; said element being normally disconnected from said motor; said key acting when depressed to connect said element with said motor: (*e*) a member continuously in operative relation to the element above mentioned: and (*f*) key mechanism, whereby said member is moved into different positions, thereby to connect the element above mentioned with the different character-corresponding devices of the group before mentioned, each as required.

100. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key controlling said motor, (*d*) a part or element normally disconnected from the motor aforesaid; the key before mentioned acting when depressed both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action so that it gives movement to said element; and (*e*) a member continuously in operative relation to the element above mentioned and movable to connect said element with the different character-corresponding devices of the group before mentioned, each as required.

101. In combination, (*a*) a group of character-corresponding devices; (*b*) a motor; (*c*) a key, controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid; the key before mentioned acting when depressed both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action, so that it gives movement to said element; (*e*) a member continuously in operative relation to the element above mentioned; and (*f*) key mechanism whereby said member is moved into different positions, thereby to connect the element before mentioned with the different character-corresponding devices of the group above mentioned, each as required.

102. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a motor; (*c*) a plurality of keys; (*d*) a plurality of elements each corresponding to and controlled by one of the keys aforesaid, conjointly with the motor aforesaid; each of said elements being normally disconnected from said motor; each of said keys acting, when depressed, to connect that one of the elements before mentioned which corresponds to said key with the motor aforesaid: and (*e*) a set of members corresponding to the elements aforesaid: each member being continuously in operative relation to that element with which it corresponds, said members being connected together and moving to connect the different elements with which they respectively correspond with the different character-corresponding devices of the groups which said elements respectively control.

103. In combination, (*a*) a plurality of groups of character-corresponding devices; (*b*) a motor; (*c*) a plurality of keys; (*d*) a plurality of elements each corresponding to and controlled by one of the keys aforesaid conjointly with the motor aforesaid; each of said elements being normally disconnected from said motor; each of said keys acting, when depressed, to connect that one of the elements before mentioned which corresponds to said key, with the motor aforesaid; (*e*) a set of members corresponding to the elements aforesaid, each member being continuously in operative relation to the element with which it corresponds, said members being connected together and movable to bring each member into operative relation with the different character-corresponding devices of the group with which each corresponds; and (*f*) key mechanism, controlling the movements of the set of members aforesaid.

104. In a type-writing machine, and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid, said element being normally disconnected from said motor; said key acting when depressed to connect said element with said motor; and (*e*) a member continuously in operative relation to the element above mentioned and movable to connect said element with the different type-bars of the group before mentioned, each as required.

105. In a type-writing machine, and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key; (*d*) an element controlled by the key and the motor aforesaid; said element being normally disconnected from said motor: said key acting when depressed to connect said element with said motor; (*e*) a member continuously in operative relation to the element above mentioned, and (*f*) key mechanism whereby said member is moved into different positions, thereby to connect the element above mentioned with the different type-bars of the group above mentioned, each as required.

106. In a type-writing machine, and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid; the key before mentioned acting when depressed both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action so that it gives movement to said element, and (*e*) a member continuously in operative relation with the element above mentioned, and movable to connect said element with the different type-bars of the group before mentioned, each as required.

107. In a type-writing machine, and in combination, (*a*) a group of type-bars; (*b*) a motor; (*c*) a key, controlling said motor; (*d*) a part or element normally disconnected from the motor aforesaid, the key before mentioned acting, when depressed, both to connect the element aforesaid with the motor aforesaid, and to bring said motor into action, so that it gives movement to said element; (*e*) a member continuously in operative relation to the element above mentioned: and (*f*) key mechanism, whereby said member is moved into different positions, thereby to connect the element before mentioned with the different type-bars of the group above mentioned, each as required.

108. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor; (*c*) a plurality of keys; (*d*) a plurality of elements each corresponding to and controlled by one of the keys aforesaid, conjointly with the motor aforesaid: each of said elements being normally disconnected from said motor; each of said keys acting, when depressed, to connect that one of the elements before mentioned which corresponds to said key with the motor aforesaid; and (*e*) a set of members corresponding to the elements aforesaid: each member being continuously in operative relation with that element with which it corresponds, said members being connected together and moving to connect the different elements with which they respectively correspond, with the different type-bars of the groups which said elements respectively control.

109. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor; (*c*) a plurality of keys; (*d*) a plurality of elements, each corresponding to and controlled by one of the keys aforesaid conjointly with the motor aforesaid; each of said elements being normally disconnected from said motor; each of said keys acting, when depressed, to connect that one of the elements before mentioned, which corresponds to said key, with the motor aforesaid: (*e*) a set of members corresponding to the elements aforesaid, each member being continuously in operative relation to the element with which it corresponds, said members being connected together and movable to bring each member into operative relation with the different type-bars of the group with which each member corresponds; and (*f*) key mechanism, controlling the movements of the set of members aforesaid.

110. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a motor, adapted to give movement to all of said character-corresponding levers, each lever as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling ele-

ments aforesaid, each as required, with the motor aforesaid; and (*f*) connecting members, intermediate the group-controlling elements aforesaid and the groups of character-corresponding levers, controlled respectively by said group-controlling elements; said connecting members being movable to connect the controlling elements corresponding respectively to them with the different character-corresponding levers which said group-controlling elements respectively control.

111. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a motor, adapted to give movement to all said character-corresponding levers, each as required; (*c*) a group of controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; said keys acting also to bring said motor into action for the impelling of the controlling elements connected with it, and (*e*) connecting members intermediate the group-controlling elements aforesaid, and the groups of character-corresponding levers which said group-controlling elements respectively control; said connecting members being movable to connect the controlling elements corresponding respectively to them with the different character-corresponding levers which said group-controlling elements respectively control.

112. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a motor, adapted to give movement to all said character-corresponding levers, each as required; (*c*) group-controlling elements normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) connecting members, equal in number to the number of groups of character-corresponding levers aforesaid and corresponding respectively each with one of said groups of character-corresponding levers, and with one of the controlling elements before mentioned; said connecting members being movable to connect the group-controlling elements aforesaid with the character-corresponding levers controlled respectively by them; and (*f*) key mechanism, whereby the connecting members aforesaid are moved to connect the different group-controlling elements aforesaid with the different character-corresponding levers that they respectively control.

113. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a frame or lever normally at rest; (*c*) group-controlling elements normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid with the frame or lever aforesaid, each as required, said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; and (*f*) connecting members intermediate the group-controlling elements aforesaid and the groups of character-corresponding levers controlled respectively by group-controlling elements aforesaid; said connecting members being movable to connect the group-controlling elements corresponding respectively to them with the different character-corresponding levers which said group-controlling elements respectively control.

114. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a frame or lever, normally at rest; (*c*) group-controlling elements normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid with the frame or lever aforesaid, each as required, said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; (*f*) a set of connecting members, equal in number to the number of groups of character-corresponding levers aforesaid, and corresponding respectively each with one of said groups of character-corresponding levers, and with one of the group-controlling elements before mentioned; said connecting members being movable to connect the group-controlling elements aforesaid with the character-corresponding levers controlled respectively by them; and (*g*) key mechanism, whereby the connecting members aforesaid are moved to connect the different group-controlling elements aforesaid with the character-corresponding levers which said group-controlling elements control.

115. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor, adapted to give movement to all of said type-bars, each type-bar as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) connecting members, intermediate the group-controlling elements aforesaid, and the groups of type-bars controlled respectively by said group-controlling elements; said connecting members being movable to connect the controlling elements corresponding respectively to them with the different type-bars, which said group-controlling elements respectively control.

116. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor adapted to give movement to all of said type-bars, each as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; said keys acting also to bring said motor into action for the impelling of the group-controlling element connected with it; and (*e*) connecting members intermediate the group-controlling elements aforesaid and the group of type-bars which said group-controlling elements respectively control; said connecting members being movable to connect the controlling elements corresponding respectively to them with the different type-bars which said group-controlling elements respectively control.

117. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor, adapted to give movement to all of said type-bars, each as required; (*c*) group-controlling elements normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) connecting members, equal in number to the number of groups of type-bars aforesaid, and corresponding respectively each with one of said groups of type-bars, and with one of the controlling elements before mentioned; said connecting members being movable to connect the group-controlling elements aforesaid with the type-bars controlled respectively by them; and (*f*) key mechanism, whereby the connecting members aforesaid are moved to connect the different group-controlling elements aforesaid with the different type-bars that they respectively control.

118. In a type writing machine, and in combination, (*a*) a plurality of groups of type-bars, (*b*) a frame or lever normally at rest; (*c*) group-controlling elements, normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid, with the frame or lever aforesaid, each as required, said keys acting also to bring the motor, aforesaid into action, so that it gives movement to the frame or lever aforesaid; and (*f*) connecting members, intermediate the group-controlling elements aforesaid, and the groups of type-bars controlled respectively by the group-controlling elements aforesaid, said connecting members being movable to connect the controlling elements corresponding respectively to them with the different type-bars which said group-controlling elements respectively control.

119. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a frame or lever, normally at rest; (*c*) group-controlling elements, normally disconnected from the frame or lever aforesaid, (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid with the frame or lever aforesaid, each as required, said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; (*f*) a set of connecting members, equal in number to the number of groups of type-bars aforesaid, and corresponding respectively each with one of said groups of type-bars and with one of the group-controlling elements before mentioned, said connecting members being movable to connect the group-controlling elements aforesaid with the type-bars controlled respectively by them; and (*d*) key mechanism, whereby the connecting members aforesaid are moved to connect the different group-controlling elements aforesaid with the type-bars which said group-controlling elements control.

120. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a motor adapted to give movement to all of said character-corresponding levers, each as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) pins, intermediate the group-controlling elements aforesaid, and the groups of character-corresponding levers aforesaid, controlled respectively by the different group controlling elements aforesaid; said pins being mounted and moving as a set to connect the group-controlling elements corresponding respectively to them, with the different character-corresponding levers which such group-controlling elements respectively control.

121. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a motor, adapted to give movement to all said character-corresponding levers, each as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) pins intermediate the group-controlling elements aforesaid, and the groups of character-corresponding levers controlled respectively by said group-controlling elements; said pins being mounted and moving as a set to connect the group-controlling elements corresponding respectively to them with the different character-corresponding levers which said group-controlling elements respectively control; and (*f*) key mechanism, whereby the pins above mentioned are moved.

122. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a frame or lever normally at rest; (*c*) group-controlling elements, normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid, with the frame or lever aforesaid, each as required; said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; and (*f*) pins intermediate the group-controlling elements aforesaid and the groups of character-corresponding levers controlled respectively by said group-controlling elements; said pins moving to connect the group-controlling elements corresponding respectively to them with the different character-corresponding levers which such group-controlling elements respectively control.

123. In combination, (*a*) a plurality of groups of character-corresponding levers; (*b*) a frame or lever normally at rest; (*c*) group-controlling elements normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid with the frame or lever aforesaid, each as required; said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; (*f*) pins intermediate the group-controlling elements aforesaid and the groups of character-corresponding levers controlled respectively by the group-controlling elements; said pins moving to connect the group-controlling elements corresponding respectively to them with the different character-corresponding levers; which such group-controlling elements respectively control; and (*g*) key mechanism, whereby the pins above mentioned are moved.

124. In combination, (*a*) a motor; (*b*) a plurality of groups of character-corresponding levers; (*c*) group-controlling levers, equal in number to the number of groups of character-corresponding levers aforesaid and corresponding each to one of the groups of levers aforesaid; (*d*) keys; (*e*) connections between the group-controlling levers aforesaid and the motor aforesaid, controlled by the keys aforesaid; and (*f*) pins, intermediate the group-controlling levers aforesaid and the character-corresponding levers, said pins being shiftable to connect the different levers of a group of character-corresponding levers, each as required, with the corresponding group-controlling lovers.

125. In combination, (*a*) a motor; (*b*) a plurality of groups of character-corresponding levers; (*c*) group-controlling levers, equal in number to the number of groups of character-corresponding levers aforesaid, and corresponding each to one of the groups of character-corresponding levers aforesaid; (*d*) keys; (*e*) connections between the group-controlling levers aforesaid and the motor aforesaid; said connections being controlled by the keys aforesaid; (*f*) pins, intermediate the group-controlling levers aforesaid and the character-corresponding levers; said pins being shiftable to connect the different levers of a group of character-corresponding levers, each as required, with the corresponding group-controlling lovers; and (*g*) key mechanism, whereby the pins aforesaid are moved into different positions, as required.

126. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a motor, adapted to give movement to all of said type-bars, each as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) pins, intermediate the group-controlling elements aforesaid and the groups of type-bars aforesaid; said pins being mounted and moving as a set to connect the group-controlling elements corresponding respectively to them with the different type-bars which said group-controlling elements control.

127. In a type-writing machine, and in combination, (*a*) a plurality of groups of type bars; (*b*) a motor, adapted to give movement to all of said type-bars, each as required; (*c*) group-controlling elements, normally disconnected from the motor aforesaid; (*d*) keys, acting to connect the different group-controlling elements aforesaid, each as required, with the motor aforesaid; (*e*) pins, intermediate the group-controlling elements aforesaid and the groups of character-corresponding levers, controlled respectively by said group-controlling elements; said pins being mounted and moving as a set to connect the group-controlling elements corresponding respectively to them with the different type-bars which said group-controlling elements respectively control; and (*f*) key mechanism whereby the pins above mentioned, are moved.

128. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a frame or lever, normally at rest; (*c*) group-controlling elements, normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid with the frame or lever aforesaid, each as required; said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; and (*f*) pins intermediate the group-controlling elements aforesaid, and the groups of type-bars controlled respectively by said group-controlling elements, said pins moving to connect the group-controlling elements corresponding respectively to them with the different type-bars which said group-controlling elements control.

129. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; (*b*) a frame or lever normally at rest; (*c*) group-controlling elements normally disconnected from the frame or lever aforesaid; (*d*) a motor; (*e*) keys, acting to connect the different group-controlling elements aforesaid, with the frame or lever aforesaid, each as required, said keys acting also to bring the motor aforesaid into action, so that it gives movement to the frame or lever aforesaid; (*f*) a set of pins, intermediate the group-controlling elements aforesaid, and the groups of type-bars controlled respectively by said group-controlling elements; said pins moving to connect the group-controlling elements corresponding respectively to them with the different type-bars, which such group-controlling elements respectively control and (*g*) key mechanism, whereby the pins above mentioned are moved.

130. In a type-writing machine, and in combination, (*a*) a motor; (*b*) a plurality of groups of type-bars; (*c*) group-controlling levers, equal in number to the number of groups of type-bars aforesaid; said group controlling elements corresponding each to one of the groups of type-bars aforesaid; (*d*) keys, (*e*) connections between the group-controlling levers aforesaid and the motor aforesaid, controlled by the keys aforesaid; and (*f*) pins, intermediate the group-controlling levers aforesaid and the type-bars aforesaid; said pins being shiftable to connect the different type-bars of a group, each type-bar, as required, with the corresponding group-controlling lever.

131. In a type-writing machine, and in combination, (*a*) a motor; (*b*) a plurality of groups of type-bars; (*c*) group-controlling levers, equal in number to the number of groups of type-bars aforesaid, said group-controlling levers corresponding each to one of the groups of type-bars aforesaid; keys; (*e*) connections between the group-controlling levers aforesaid and the motor aforesaid, said connections being controlled by the keys aforesaid; (*f*) a set of pins intermediate the group-controlling levers aforesaid, and the type-bars aforesaid; said pins being shiftable to connect the different type-bars of a group, each type-bar as required, with the corresponding group-controlling lever; and (*g*) key mechanism whereby the set of pins aforesaid is moved into different positions, as required.

132. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including in combination, (A) two sets of type-bars; the type-bars of each set being arranged in such a manner that they strike to a printing-point common to the bars of such set; and (B) a type-bar-controlling mechanism for each of the sets of type-bars above mentioned; one of the type-bar-controlling mechanisms above mentioned being a permutational type-bar-selecting device, having a number of keys less than the number of type-bars controlled by it; said permutational type-bar-selecting device being constructed and arranged in such a manner that its small number of keys, operating in various permutations or combinations, serves to bring the various type-bars controlled by it into action, each as required; said permutational type-bar-selecting device including (*c*) a single-motor device, common to the type-bars of the set controlled by said permutational type-bar-selecting device, and serving to impel all said type bars, each type-bar as required; a plurality of said type-bars being normally disconnected from said motor device; and (*b*) means, whereby said type-bars are connected, each as required, with the motor device aforesaid.

133. In a type-writing machine, or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including in combination, (A) two sets of type-bars; the bars of each set being arranged in such a manner that they strike to a printing-point common to the bars of such set; and (B) a type-bar-controlling mechanism for each of the sets of type-bars above mentioned; each of the type-bar-controlling mechanisms above mentioned being a permutational type-bar-selecting device, having a number of keys less than the number of type-bars controlled by it; said permutational type-bar-selecting device being constructed and arranged in such a manner that its small number of keys operating in various permutations or combinations, serves to bring the various type-bars controlled by it into action, each type bar as required; each of said permutational type-bar-selecting devices including (*a*) a motor device, common to the type-bars of the set controlled by each permutational type-bar-selecting device; said motor device serving to impel all said type-bars, each type-bar as required; a plurality of said type-bars being normally disconnected from said motor device; and (*b*) means whereby said type-bars are connected, each as required, with the motor device aforesaid.

134. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, in combination, (A) two sets of type-bars; the bars of each set being arranged in such a manner that they strike to a printing-point common to the bars of such set; (B) a quick-acting type-bar-controlling mechanism for one of the sets of type-bars above mentioned; and (C) a slow-acting type-bar-controlling mechanism for the other set of type bars above mentioned;

each of the type-bar-controlling mechanisms above mentioned being a permutational type-bar-selecting device, having a number of keys less than the number of type bars controlled by it; said permutational type-bar-selecting device being constructed and arranged in such a manner that a small number of keys operating in various permutations or combinations serves to bring the various type-bars controlled by it into action, each type-bar as required; each of said permutational type-bar-selecting devices including (*a*) a single motor device, common to the type-bars of the set controlled by such permutational type-bar-selecting device; said motor device serving to impel all said type-bars, each type-bar as required; a plurality of said type-bars being normally disconnected from said motor device; and (*b*) means whereby said type-bars are connected, each as required, with a motor device serving for the set of type-bars to which it belongs.

135. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organization including, two sets of type-bars, the type-bars of each set being arranged in such a manner that they strike to a printing-point common to the type-bars of such set, the printing-points of the two sets of type-bars being distinct from and adjacent to each other; two motor devices, one motor device serving to actuate all the type-bars of one of the two sets aforesaid, and the other motor device serving to actuate all the type-bars of the other set above mentioned; and permutational selecting mechanism for each set of type-bars, including (*a*) keys less in number than the type-bars of the set controlled by them; and (*b*) means, controlled by said keys acting singly and in different combinations, whereby the different type-bars of such set are connected, each type-bar as required, with the motor device serving for the type-bars of such set.

136. In a type-writing machine or other similar instrument, an organization for producing consecutive letters by simultaneous actions of the operator, said organizations including two sets of type-bars, the bars of each set being arranged in such a manner that they strike to a printing-point common to the bars of such set; (B) two motor devices, to wit, a quick-acting motor device, serving to actuate all the type-bars of one of the two sets aforesaid; and a slow-acting motor device, serving to actuate all the type-bars of the other set above mentioned; and (C) a permutational selecting mechanism for each of the sets of type-bars aforesaid; each of said permutational selecting mechanisms including (*a*) keys less in number than the type-bars of the set controlled by them; and (*b*) means controlled by said keys acting singly and in different combinations, whereby the different type-bars of such set are connected, each type-bar as required, with the motor device serving for the type-bar of such set.

137. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (*b*) a motor device, acting to impel all said type-bars, each as required; (*c*) keys, each controlling a different group of the type-bars aforesaid, and acting, when depressed, to cause some one of the type-bars of said group to be connected with the motor device aforesaid; and (*d*) means, controlling what type-bar of the group shall be connected with the motor device aforesaid.

138. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (*b*) a motor device, acting to impel all said type-bars, each as required; (*c*) keys, each controlling a different group of the type-bars aforesaid, and acting when depressed to cause some one of the type-bars of said group to be connected with the motor device aforesaid; and (*d*) means, operated by one or more other keys acting simultaneously with the keys aforesaid to control what type-bar of the group shall be connected with the motor device aforesaid.

139. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a single motor device, acting to impel all said type-bars, each type-bar as required; (*c*) a group of keys, each key controlling a different group of the type-bars aforesaid; (*d*) other keys, and means controlled thereby coacting with the keys first named to connect the type-bars aforesaid, each as required, with the motor device aforesaid; the keys first in this paragraph mentioned acting, when depressed, to control what group of type-bars shall have one of its bars connected with the motor device aforesaid, and the keys of the other group acting simultaneously to control what type-bar of such group shall be connected with the motor device aforesaid.

140. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a single motor device, acting to impel all said type-bars, each type-bar as required; (*c*) a group of finger-keys, each controlling a different group of the type-bars aforesaid; and (*d*) one or more thumb-keys, and means operated thereby coacting with the finger-keys to connect the type-bars aforesaid each as required, with the motor device aforesaid; the finger-keys aforesaid acting, when depressed, to control what group of type-bars shall have one of its bars connected with the motor device aforesaid, and the thumb-key or thumb-keys acting to control what type-bar of such group shall be connected with said motor device.

141. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (*b*) a single motor device, acting to impel all said type-bars, each type-bar as required; (*c*) keys, less in number than the groups of type-bars aforesaid, each of said keys controlling a different group of said type-bars, and acting to cause some one of the type-bars of the group controlled by it to be connected with the motor device aforesaid; (*d*) an element, controlling one or more other type-bars striking to the same printing-center as the type-bars above mentioned; said element being itself controlled by the keys above mentioned, and acting as an alternative to said keys; and (*e*) means, controlling what type-bar of the group shall be connected with the motor device aforesaid.

142. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (*b*) a single motor device, acting to impel all said type-bars, each type-bar as required; (*c*) keys, less in number than the groups of type-bars aforesaid, each of said keys controlling a different group of said type-bars and acting to cause some one of the type-bars of the group controlled by it to be connected with the motor device aforesaid; (*d*) an element, controlling one or more other type-bars striking to the same printing-center as the type-bars above mentioned; said element being itself controlled by the keys above mentioned and acting as an alternative to said keys, and (*e*) one or more other keys, controlling what type-bars of a group shall be connected with the motor device aforesaid.

143. In a type writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (*b*) a motor device, acting to impel all said type-bars, each type-bar as required; (*c*) finger-keys, less in number than the groups of type-bars aforesaid; said finger-keys each controlling a different group of said type-bars and acting to cause some one of the type-bars of the group controlled by it to be connected with the motor device aforesaid; (*d*) an element, controlling one or more other type-bars striking to the same printing-center as the other type-bars first above mentioned; said element being itself controlled by the keys above mentioned, and serving as an alternative to said keys; and (*e*) one or more thumb-keys, coacting with the finger-keys above mentioned to control what type-bar of the group controlled by the finger-key depressed shall be connected with the motor device aforesaid.

144. In combination, (A) a plurality of groups of character-corresponding devices; (B) a single motor device, serving to actuate all of said character-corresponding devices; each as required; and (C) double selective devices, acting both (*a*) to select what group of the character-corresponding devices aforesaid shall have one of its character-corresponding devices connected with the motor device aforesaid, and (*d*) to select what character-corresponding device in such group shall be connected with said motor device.

145. In combination, (A) a plurality of groups of character-corresponding devices; (B) a single motor device, serving to actuate all said character-corresponding devices, each as required; and (C) double selective devices acting both (*a*) to select what group of the character-corresponding devices aforesaid shall have one of its character-corresponding devices connected with the motor device aforesaid, and (*b*) to select what character-corresponding device in such group shall be connected with said motor device; said double selective devices including two groups of keys: the keys of one group controlling what group of the character-corresponding devices aforesaid shall have one of its character-corresponding devices connected with the motor device aforesaid; and the keys of the other group controlling what character-corresponding device in such group shall be connected with the motor device aforesaid.

146. In combination, (A) a plurality of groups of character-corresponding devices; (B) a single motor device, serving to actuate all of said character-corresponding devices, each as required; and (C) double selective devices, acting both (*a*) to select what group of the character-corresponding devices aforesaid shall have one of its character-corresponding devices connected with the motor device aforesaid; and (*b*) to select what character corresponding device in such group shall be connected with said motor device; said double selective devices including finger-keys, controlling what group of the character-corresponding devices aforesaid shall have one of its character-corresponding devices connected with the motor device aforesaid; and one or more thumb-keys, controlling what character-corresponding device in such group shall be connected with said motor device.

147. In a type-writing machine, and in combination, (A) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (B) a single motor device, acting to impel all said type-bars, each as required; and (C) double selective devices, acting both (*a*) to select what group of type-bars connected with the motor device aforesaid, and (*b*) to select what type-bar in each group shall be connected with said motor device.

148. In a type-writing machine, and in combination, (A) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (B) a single motor device, acting to impel all said type-bars, each as required; and (C) double selective devices, acting both (*a*) to select what group of type-bars shall have one of its type-bars connected with the motor device aforesaid; and (*b*) to select what type-bar in each group shall be connected with said motor device; said double selective devices including two groups of keys; the keys of one group controlling what group of the type-bars aforesaid shall have one of its type-bars connected with the motor device aforesaid; and the keys of the other group controlling what type-bars in each group shall be connected with the motor device aforesaid; some or all of the keys aforesaid controlling also the motor device aforesaid.

149. In a type-writing machine, and in combination, (A) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (B) a single motor device, acting to impel all of said type-bars, each as required; and (C) double selective devices, acting both (*a*) to select what group of type-bars shall have one of its type-bars connected with the motor device aforesaid, and (*b*) to select what type-bar in each group shall be connected with said motor device; said double selective devices including finger-keys, controlling what group of type-bars aforesaid shall have one of its type-bars connected with the motor device aforesaid, and one or more thumb-keys controlling what type-bars in each group shall be connected with said motor device; some or all of the keys aforesaid controlling the motor device aforesaid.

150. In combination, (A) a plurality of groups of character-corresponding devices; (B) a frame or lever, serving to give movement to all said character corresponding devices, each as required; and (C) double selective devices, acting both (*a*) to select what group of the character-corresponding devices aforesaid shall have one of its number connected with the frame or lever aforesaid, and (*b*) to select what character-corresponding device in each group shall be connected with said frame or lever.

151. In combination, (A) a plurality of groups of character-corresponding devices; (B) a frame or lever, serving to give movement to all said character-corresponding devices, each as required; (C) double selective devices, acting both (*a*) to select what group of the character-corresponding devices aforesaid shall have one of its number connected with the frame or lever aforesaid and (*b*) to select what character-corresponding device in each group shall be connected with said frame or lever; said double selective devices including a plurality of keys, controlling what group of the character-corresponding devices aforesaid shall have one of its number connected with the frame or lever aforesaid, and one or more other keys, controlling what character-corresponding device in each group shall be connected with said frame or lever.

152. In combination, (A) a plurality of groups of character-corresponding devices; (B) a frame or lever, serving to give movement to all said character-corresponding devices, each as required; and (C) double selective devices, acting both (*a*) to select what group of the character-corresponding devices aforesaid shall have one of its number connected with the frame or lever aforesaid, and (*b*) to select what character-corresponding device in each group shall be connected with said frame or lever; said double selective devices including finger-keys, controlling what group of the character-corresponding devices aforesaid shall have one of its number connected with the frame or lever aforesaid, and one or more thumb-keys controlling what character-corresponding device in each group shall be connected with said frame or lever.

153. In a type-writing machine and in combination, (A) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (B) a frame or lever, serving to give movement to all said type-bars, each as required; and (C) double selective devices, acting both (*a*) to select what group of type-bars shall have one of its type-bars connected with the frame or lever aforesaid, and (*b*) to select what type-bar in each group shall be connected with said frame or lever.

154. In a type-writing machine, and in combination, (A) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (B) a frame or lever, serving to give movement to all said type-bars, each as required; and (C) double selective devices, acting both (*a*) to select what group of type-bars shall have one of its type-bars connected with the frame or lever aforesaid, and (*b*) to select what type-bar in each group shall be connected with said frame or lever; said double selective devices including a plurality of keys, controlling what group of the type-bars aforesaid shall have one of its type-bars connected with the frame or lever aforesaid, and one or more other keys, controlling what type-bar in each group shall be connected with said frame or lever; some or all of the keys above mentioned controlling the frame or lever aforesaid.

155. In a type-writing machine and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (B) a frame or lever, serving to give movement to all said type-bars, each as required; and (C) double selective devices, acting both (*a*) to select what group of type-bars shall have one of its type-bars connected with the frame or lever aforesaid, and (*b*) to select what type-bar in each group shall be connected with said frame or lever; said double selective devices including finger-keys, controlling what group of the type-bars aforesaid shall have one of its type-bars connected with the frame or lever aforesaid, and one or more thumb-keys controlling what type-bar in each group shall be connected with said frame or lever; some or all of the keys aforesaid controlling the frame or lever aforesaid.

156. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center, (*b*) a frame or lever, serving to give movement to all said type-bars, each as required; (*c*) keys, each controlling a different group of the type-bars aforesaid, and acting, when depressed, to cause some one of the type-bars of said group to be connected with the frame or lever aforesaid; and (*d*) means controlling what type-bar of a group shall be connected with said frame or lever.

157. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars; said type-bars striking to a common printing-center; (*b*) a frame or lever serving to give movement to all said type-bars, each as required; (*c*) keys, each controlling a different group of the type-bars aforesaid, and acting, when depressed, to cause some one of the type-bars of said group to be connected with the frame or lever aforesaid; and (*d*) means, operated by one or more other keys acting simultaneously with the keys aforesaid to control what type-bar of a group shall be connected with the motor device aforesaid.

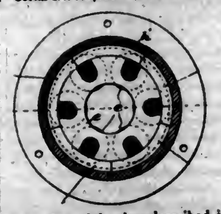
158. In a type-writing machine, and in combination, (*a*) a plurality of groups of type-bars, said type-bars striking to a common printing-center; (*b*) a frame or lever, acting to give movement to all said type-bars, each type-bar as required; (*c*) a group of finger-keys, each controlling a different group of the type-bars aforesaid; and (*d*) one or more thumb-keys and means operated thereby, coacting with the finger-keys to connect the type-bars aforesaid, each as required, with the frame or lever aforesaid; the finger-keys aforesaid acting, when depressed, to control what group of type-bars shall have one of its type-bars connected with the frame or lever aforesaid, and the thumb-key or thumb-keys acting to control what type-bar of such group shall be connected with said frame or lever.

604,002. ROTARY CUTTER FOR LEATHER-WORK. EUGENE CHILDS, Boston, Mass., assignor to the Trimont Manufacturing Company, Portland, Me. Filed Aug. 27, 1897. Serial No. 649,719. (No model.)

Claim.—1. A rotatable cutter-head composed of a flange or face having a plurality of eccentric crossing grooves; a plurality of cutter-blades each having a foot extended from its side substantially at right angles, each foot having a rib to enter one of said grooves; and means to clamp said feet closely to the face of the said head, substantially as described.

2. A rotatable cutter-head composed of a flange or face having a plurality of eccentric crossing grooves; a plurality of cutter-blades having each a foot extended from its concaved side, substantially at right angles, each foot having a rib to enter one of said grooves; means to clamp said feet closely to the face of the said head; and an adjustable ring having a plurality of stops to cooperate with the heels of and position the blades, substantially as described.

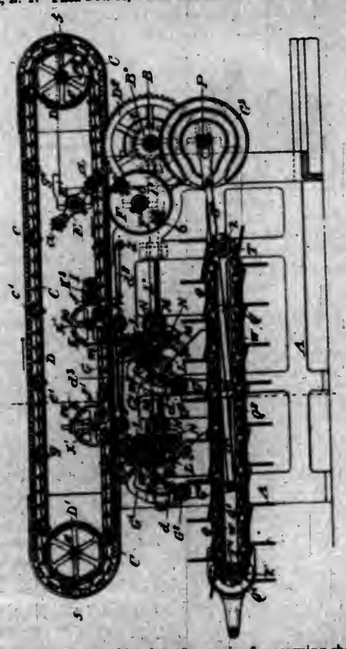
3. A rotatable cutter-head composed of a flange or face having a plurality of eccentric crossing grooves; a plurality of cutter blades having each a foot extended from its side substantially at right angles, each foot having a rib to enter one of said grooves; means to clamp said feet closely to the face of the said head; an adjustable ring having a plurality of stops, and a plurality of series of holes, the holes of each series of holes in the ring occupying varying positions with relation to said stops; and a device to hold the said ring in working position, whereby very minute adjustments of the cutter-blades may be gained, substantially as described.



4. A series of cutter-blades having each a foot extended inwardly therefrom, said foot having a concave-convex rib extending from it at its edge opposite the blade and in a direction opposite said blade, combined with a head to clamp and carry said cutter-blades, the

ribs of said blades entering a series of eccentric grooves and being adjustable therein, substantially as described.

5. The herein-described cutter, it presenting a longitudinally concavo-convex blade having extended inwardly from its concaved side a foot, the said foot at its edge opposite said blade having extended from it in a direction opposite the direction of said blade a narrow concavo-convex rib, said rib being equidistant throughout from the said blade, substantially as described.



6. In a rotary cutter, a plurality of blades, and means to hold said blades in position, combined with a stop-ring provided with a series of holes and stops by which to secure proper adjustments of said blades and means cooperating with said holes to enable said ring to be held in its adjusted position, substantially as described.

604,003. ANTIFRICTION HUB OR WHEEL BEARING. ROBERT CHILDS, Boston, Mass., assignor to Edward O. Hy, same place. Filed Dec. 17, 1897. Serial No. 662,300. (No model.)

Claim.—A hub-bearing of the class described, it being composed of a hollow body provided with an internal annular groove, said body being slotted externally to intersect a part of said annular groove; a set of rollers having annular grooves, and a bearing-ring; combined with a series of segments inserted through said external slot and entering the annular groove of said body and also the grooves of said rollers; and a keeper to close said slot and prevent the escape of said segments, substantially as described.

604,004. MACHINE FOR CUTTING AND FOLDING PAPER. EDGAR H. COTTRELL and CHARLES P. COTTRELL, Stonington, Conn., assignors to the C. B. Cottrell & Sons Company, same place and New York, N. Y. Filed Feb. 11, 1897. Serial No. 622,947. (No model.)

Claim.—1. The combination of a carrier for carrying sheets one before another, a folding apparatus, assembling-rollers located between the carrier and the folding apparatus and having a surface velocity less than that of the carrier for taking therefrom several sheets one after another and placing them in a pile on the folding apparatus, means for operating the folding apparatus to produce the folding at once of the several sheets of the pile and cutters for cutting at once the several sheets thus folded together, substantially as herein described.

2. The combination of a carrier for carrying sheets one before another, a reciprocating folding-blade under said carrier, a folding-bed having an opening for said blade, assembling-rollers located between said carrier and said bed and having a surface velocity less than that of said carrier for taking several sheets one after another from said carrier and placing them in a pile on said bed, and a stop-gage against which the sheets are successively received on said bed, substantially as herein described.

3. The combination of a carrier for carrying sheets one before another, a folding apparatus located under entirely below said carrier, sheet-assembling rollers independent of said carrier located between the carrier and the folding apparatus and having a surface velocity less than that of the carrier, a bar arranged crosswise of the carrier and having attached to it fingers which project downward to direct the sheets downward therefrom to the folding apparatus, substantially as herein described.

4. The combination of a carrier, cutters for cutting paper into sheets in said carrier, a folding apparatus, assembling-rollers independent of said carrier located between the said carrier and folding apparatus for taking from the said carrier one after another several sheets cut by said cutters and placing said sheets one at a time in a pile on the folding apparatus, and means for operating the folding apparatus to produce the folding at once of the several sheets of the pile, substantially as herein described.

5. The combination of a carrier, cutters for cutting a web into sheets in said carrier, a folding apparatus, assembling-rollers independent of said carrier located between the said carrier and the folding apparatus and having a surface velocity less than that of said carrier for taking therefrom one after another several sheets cut from the web therein by said cutters and placing said sheets in a pile on the folding apparatus, and means for operating the folding apparatus to produce the folding at once of the several sheets of the pile, substantially as herein described.

6. The combination of a carrier for carrying sheets one before another, a reciprocating folding-blade under said carrier, a folding-bed consisting of a slotted plate stationary under said carrier with a downward inclination in the direction of the operating movement of the carrier, assembling-rollers for taking the sheets from said carrier to said plate, bars arranged across said plate above and below its folding-slot and carrying-fingers for guiding the sheets over the face of said plate and confining them thereto, substantially as herein described.

7. The combination of an endless carrier provided with sheet-holding grippers, and a pair of assembling-rollers having a surface velocity less than that of the carrier for taking sheets one after another from said carrier, one of said rollers having notches for the passage of the grippers between said rollers, substantially as herein described.

8. The combination of a carrier, rotary cutters for cutting a web transversely into sheets in said carrier, a folding apparatus arranged below said carrier for folding the cut sheets parallel with their cuts, assembling-rollers for taking the sheets one at a time from said carrier and presenting them in a pile to said folding apparatus, and cutters for slitting at once the several folded sheets of a pile transversely to their folds, substantially as herein described.

9. The combination of two folding apparatuses arranged one before the other, sheet-carrying devices running to both of said apparatuses, a pair of assembling rollers for each folding apparatus and mechanism for separating the assembling-rollers of one pair to allow sheets to pass by that pair and its respective folding apparatus to be taken by the other pair to the other folding apparatus, substantially as herein described.

10. The combination of two folding apparatuses arranged one before the other, a sheet-carrier having grippers in alternate series running past both of said apparatuses, a pair of assembling-rollers for each folding apparatus, and mechanism for separating the assembling-rollers of one pair to allow sheets carried by the grippers of one series to pass by that pair and its respective folding apparatus to be taken by the other pair to the other folding apparatus, substantially as herein described.

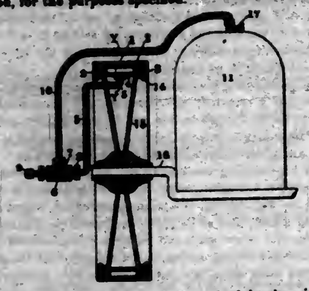
11. The combination of two folding apparatuses arranged one before the other, a sheet-carrier having grippers in alternate series running past both of said apparatuses, a pair of assembling-rollers for each folding apparatus, a bar with attached fingers for directing the sheets from the grippers of one series from one pair of assembling-rollers to the folding apparatus for that pair and means for operating said bar and fingers to allow the sheets in the grippers of the other series to pass by said fingers to the other folding apparatus, substantially as herein described.

12. The combination of two folding apparatuses arranged one before the other, a sheet-carrier running past both of said apparatuses to present sheets to each of them, and an intermittently-traveling delivery-carrier common to both feeding apparatuses for receiving folded sheets first from one and afterward from the other of said folding apparatuses, substantially as herein described.

13. The combination of two folding apparatuses arranged one before the other, a sheet carrier running past both of said apparatuses to present sheets to each of them, an intermittently-traveling delivery-carrier common to both feeding apparatuses for receiving folded sheets first from one and afterward from the other of said folding apparatuses, and cutters between each folding apparatus and the delivery-carrier, substantially as herein described.

14. The combination for locking and unlocking the cam-lever U^6 to control the operation of the delivery-carrier, of the geared tappet-wheels V W and their tappets v v', the catch-hook u^4 for engaging with a projection u^5 on said lever and the trip-lever t^6 through which the tappet v acts upon said catch-hook, substantially as herein described.

604,005. FEEDING MECHANISM FOR SEWING-MACHINES. GEORGE H. BURNS and WILBUR F. DAY, Bridgeport, Conn., assignors to The Wheeler & Wilson Manufacturing Company, same place. Filed Feb. 2, 1897. Serial No. 621,889. (No model.)



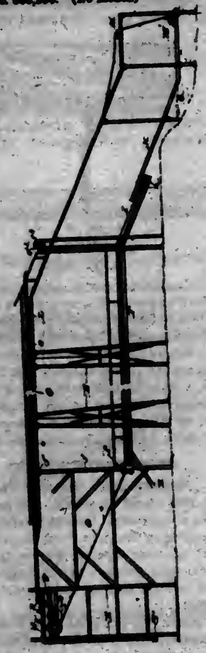
Claim.—1. In a sewing-machine, a cylindrical arm for the reception of the work, a presser-foot, a feeding mechanism comprising a carrier provided with a horizontally-arranged guide and having a vertical guideway and two attached ears or lugs to constitute guides, and a feed-dog having at one end a cam-strap and at its opposite end a feed-point, which, as it is raised, engages the material under the presser-foot, the shank of said feed-dog entering the guideway of the carrier and the strap fitting between the said ears or lugs; combined with means to reciprocate said carrier horizontally and an independent rotatable shaft having a cam located in said strap and acting only on said feed-dog to impart to it vertical movement in said carrier, substantially as described.

2. The cylindrical arm, the transversely-movable carrier therein having a horizontally-arranged guide adapted to slide in said arm; the shaft A^5 having a cam A^{20}; a rock-shaft B having an attached arm d^{14}, means to actuate said rock-shaft; an auxiliary rock-shaft parallel therewith and extended into said cylindrical arm, and provided at its rear end with an arm d^{12} which is joined at d^{13} to the said arm d^{14}, said auxiliary rock-shaft having at its front end an arm, and connections between said arm and said carrier, whereby said carrier is moved back and forth by or through the said auxiliary rock-shaft, and the feed-dog mounted in said carrier is moved vertically through the action of said cam A^{20}, substantially as described.

3. In a sewing-machine, a rotating shaft A^5 provided with a cam A^{20} and with a grooved collar, a cylindrical arm, through which said shaft is extended, a carrier composed of two parts d and $d^{\times}$ and slotted to slide horizontally on said shaft, one of said parts entering the groove of said collar, said carrier also having a vertically-arranged guideway, an auxiliary rock-shaft extended through said cylindrical arm, means to actuate said rock-shaft and connections between said rock-shaft and said carrier to enable the said auxiliary rock-shaft to move the carrier horizontally, combined with a feed-dog fitted to be moved vertically in the guideway of the said carrier and acted upon by the cam on the said shaft A^5, substantially as described.

604,006. TRACTION-WHEEL. HENRY G. DURRELL, Beecher, Ill. Filed Aug. 14, 1897. Serial No. 648,286. (No model.)

Claim.—1. A traction-wheel having a hollow air-tight rim, with a partition 13 therein, and a discharge-cock on one side of said partitions opening out of the rim, in combination with steam connections communicating with said rim on the opposite side of the partition, and adapted to convey steam or hot air into said rim while the wheel is in motion, for the purposes specified.



2. A traction-wheel having a hollow air-tight rim; in combination with a pipe 5 communicating therewith at one end, having its other end bent in line with the axle of the wheel, and having a port 6 therein; an air-tight connection in which said other end is journaled; and a pipe 10 secured to said connection for conveying steam or hot air through the port 6 and into said rim, for the purposes specified.

3. A traction-wheel having a hollow, air-tight rim with a partition 13 therein, and a discharge-cock on one side of said partition opening out of the rim; in combination with a pipe 5 communicating therewith at one end, on the opposite side of the partition, having its other end bent in line with the axle of the wheel and having a port 6 therein; an air-tight connection in which said other end is journaled, and a pipe 10 secured to said connection for conveying steam or hot air through the port 6 and into said rim, for the purposes specified.

4. A traction-wheel having an inner rim 4 and an outer rim 2 secured to same and grooved so as to form an air-tight compartment between said rims, and a gasket 3 intervening said rims on either side, in combination with steam connections, adapted to convey steam or hot air into said compartment while the wheel is in motion, substantially as and for the purposes specified.

604,007. ICE-HANDLING MACHINERY. ARTHUR GIFFORD, Hudson, N. Y., assignor to Gifford Brothers, same place. Filed Jan. 17, 1898. Serial No. 666,936. (No model.)

Claim.—1. In ice-handling machinery the combination with an adjustable gallery having slideways for the ice and a conveyer passing along said gallery for propelling the ice, of an incline hinged to said gallery at one end and a telescoping section in said incline, said incline also having a slideway corresponding to the slideway on the gallery; substantially as described.

2. In ice-handling machinery the combination with the supporting-towers and a vertically-adjustable gallery mounted therein, of a telescoping incline hinged to one end of said gallery and extending down to the source of supply, with a conveyer traveling up said incline and along the gallery; substantially as described.

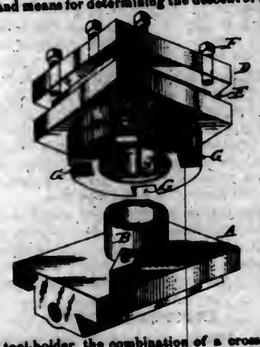
3. In ice-handling machinery the combination with the vertically-adjustable conveyer-gallery and the permanent section of the incline at one end thereof, of a telescoping incline hinged at its upper end to said gallery and at its lower end to the permanent section of the incline, said telescoping and permanent sections of the incline having slideways corresponding to the slideways on the gallery, and a conveyer passing along said gallery and incline; substantially as described.

4. In ice-handling machinery the combination with the series of towers, the vertically-adjustable gallery suspended in said towers with means for raising and lowering the same and the permanent section of the incline at one end of said gallery, of a telescoping section hinged at one end to said gallery and at the opposite end to the permanent section of the incline, the parts of said telescoping section being united by hangers and having antifriction-rollers interposed therebetween, and the conveyer passing along the gallery and incline; substantially as described.

5. In ice-handling machinery the combination with the vertically-adjustable gallery having the slideways for ice thereon and the incline extending from said gallery to the source of ice-supply, and a continuous conveyer-chain passing along said gallery in one direction, of a driving mechanism for moving said conveyer-chain and a weighted take-up cooperating with said conveyer-chain to equalize the tension on the same when the gallery is adjusted; substantially as described.

6. In ice-handling machinery the combination with the vertically-adjustable gallery having slideways thereon and the telescoping incline at the end of said gallery extending down to the source of ice-supply, of a conveyer-chain passing along said gallery and incline, a driving mechanism for moving said chain and a weighted take-up over which said chain passes for equalizing the tension on said chain when the gallery is raised or lowered and the telescoping incline extended or contracted; substantially as described.

604,008. DESK OR TABLE ATTACHMENT FOR FURNITURE. EMMA HUGHES, Wichita, Kans. Filed June 4, 1892. Serial No. 435,483. (No model.)



Claim.—A table-adjusting device comprising a clamp adapted to be secured to a fixed support and formed with a vertically-projecting disk, a rod provided with a vertically-projecting disk on its lower end, said disk being adapted to coact with the disk on the clamp to form a hinge, a sleeve adapted to loosely receive the rod, a thumb-screw for binding the rod in the sleeve, a disk formed on the upper end of the sleeve, a plate adapted to be secured to the under side of a table and formed with a depending disk adapted to coact with the disk on the sleeve to form a hinge, and thumb-screws uniting the respective pairs of disks, substantially as and for the purposes stated.

604,009. TOOL-HOLDER. HERBERT S. JOHNSON, Madison, Wis. Filed Nov. 22, 1897. Serial No. 660,473. (No model.)

Claim.—1. In a tool-holder, the combination of a cross-slide or base; a post extending up therefrom; a shell mounted upon said post and provided with an outer tapering face; a tool-carrier provided with an internal tapering bore surrounding said shell; a connection between said shell and tool carrier; and a screw for raising and lowering the taper-shell.

2. In a tool-holder, the combination of a cross-slide or base; a post extending up therefrom; a shell mounted upon said post and provided with an outer tapering face; a tool-carrier provided with an internal tapering bore surrounding said shell; a connection between said shell and tool-carrier; a screw for raising and lowering the taper-shell; and means for determining the descent of the tool-carrier.

3. In a tool-holder, the combination of a cross-slide or base; a post extending up therefrom; a shell mounted upon said post and provided with an outer tapering face; a tool-carrier provided with an internal tapering bore surrounding said shell; a connection between said shell and tool-carrier; recesses formed in the base of the carrier; a post extending up from the base in line with said recesses; adjusting-screws passing through the tool-carrier into said recesses; and a screw working in the post connected to the shell and designed to elevate and lower the parts.

4. In a tool-holder, the combination of a cross-slide or base; a post extending up therefrom; a shell mounted upon said post and provided with an outer tapering face and slots J in its side; a tool-carrier provided with an internal tapering bore surrounding said shell and with recesses or pockets G and adjusting-screws H; a connection between said shell and tool-carrier; a block extending up from the base in line with the recesses in the tool-carrier; and a screw working in the upper end of the post and connected to the shell.

5. In a tool holder, the combination of a cross-slide or base; a post extending up therefrom; a shell mounted upon said post provided with an outer tapering face and slots J in its side; a tool-carrier provided with an internal tapering bore surrounding said shell, and with recesses or pockets G in its base; adjusting-screws extending through the carrier into said recesses; a block extending up from the base in line with said recesses; a screw L secured in the tool-carrier and extending into an opening K in the shell; and a screw working in a nut carried in the upper end of the post, said screw being connected to the shell, substantially as described.

6. In a tool-holder, the combination of a cross-slide or base; a post extending upwardly therefrom; a tool-carrier; a wedge-shaped shell intermediate said carrier and post; means for raising and lowering the carrier and shell; and means for preventing the parts from rotating about the post when in their lowered and clamped position.

604,010. MECHANICAL MOVEMENT. CHARLES B. JUDD, Detroit, Mich. Filed Jan. 27, 1897. Serial No. 620,991. (No model.)

Claim.—1. In a mechanism for producing mechanical movements, the combination of a shaft having a disk rigidly mounted upon one end thereof, said disk having a triangular recess in that face lying farthest from the shaft, the sides of said triangle being curved inward and uniting with the side walls of the angles to form guides, a bar adapted to extend across said triangular recess, rollers mounted upon said bar adapted to engage two sides of said triangle at each angle thereof, a crank-shaft supported in axial line with said main shaft, a crank rigidly secured to said shaft and having its free end pivoted to a point in said bar substantially midway between the two rollers, and means for guiding the opposite end of said bar, substantially as described.

2. In a machine for the purpose set forth, the combination of the driven shaft journaled in bearings, a disk secured to said driven shaft, said disk having an angled recess in its face opposite the side to which said shaft is secured; a vibrating lever having friction-rollers pivoted thereto, said rollers adapted to travel in said angled recess, a cross-head secured to said bar, a guideway in which said head is adapted to reciprocate, a crank-arm secured to said bar between said friction-rollers, and the driven shaft suitably journaled in the frame and fastened to said crank-arm, substantially as and for the purpose set forth.

DESIGNS.

28,552. HANDLE FOR BUTTON-HOOKS OR SIMILAR ARTICLES. HERMAN F. W. SCHLOEMER, Newark, N. J., assignor to Eastwood & Park, same place. Filed Mar. 9, 1898. Serial No. 673,273. Term of patent 3½ years.

Claim.—The design for a handle of a button-hook or similar article, substantially as herein shown and described.

28,553. HANDLE FOR BUTTON-HOOKS, &c. FRANK R. STAFFORD, Providence, R. I., assignor to the Waite, Thrasher Company, same place. Filed Feb. 22, 1898. Serial No. 671,696. Term of patent 3½ years.

Claim.—The design for a handle for button-hooks and similar articles, herein shown and described.

28,554. HANDLE FOR BUTTON-HOOKS OR SIMILAR ARTICLES. EUSTACE CREES and CHARLES S. COURT, Providence, R. I., assignors to the Waite, Thrasher Company, same place. Filed Feb. 25, 1898. Serial No. 671,695. Term of patent 3½ years.

Claim.—The design for a handle for button-hooks and similar articles, herein shown and described.

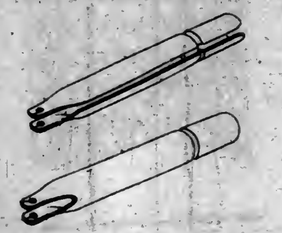
28,555. HANDLE FOR BUTTON-HOOKS OR SIMILAR ARTICLES. EUSTACE CREES and CHARLES S. COURT, Providence, R. I., assignors to the Waite, Thrasher Company, same place. Filed Mar. 19, 1898. Serial No. 674,541. Term of patent 3½ years.

Claim.—The design for a handle for button hooks and similar articles herein shown and described.

28,556. HANDLE FOR BUTTON-HOOKS OR SIMILAR ARTICLES. EUSTACE CREES and CHARLES S. COURT, Providence, R. I., assignors to the Waite, Thrasher Company, same place. Filed Mar. 19, 1898. Serial No. 674,542. Term of patent 3½ years.

Claim.—The design for a handle for button-hooks and similar articles, herein shown and described.

28,557. HANDLE FOR BUTTON-HOOKS OR SIMILAR ARTICLES. EUSTACE CREES and CHARLES S. COURT, Providence, R. I., assignors to the Waite, Thrasher Company, same place. Filed Mar. 19, 1898. Serial No. 674,543. Term of patent 3½ years.



Claim.—The design for a handle for button-hooks, and similar articles, &c., herein shown and described.

28,558. LEAD-PENCIL. BYRON B. GOLDSMITH, New York, N. Y. Filed Feb. 8, 1898. Serial No. 669,594. Term of patent 14 years.

Claim.—The design for a lead-pencil substantially as herein shown and described.

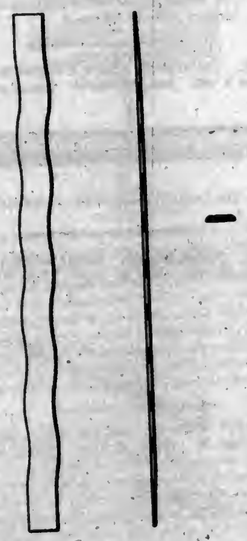
28,559. PENCIL-HOLDER. NATHAN D. INGRAM, Holyoke, Mass. Filed Mar. 30, 1898. Serial No. 675,807. Term of patent 14 years.

Claim.—The design for a pencil-holder, substantially as herein described and shown.

28,560. SUSPENDER-BUCKLE. AARON COLEMAN, New York, N. Y. Filed Mar. 19, 1898. Serial No. 674,630. Term of patent 7 years.

Claim.—A design for a suspender-buckle, as herein shown and described.

28,561. HOOK FOR GARMENT-CLASPS. FREDERICK A. IVES, Cheshire, Conn., assignor to the Cheshire Manufacturing Company, same place. Filed Sept. 20, 1897. Serial No. 653,054. Term of patent 14 years.



Claim.—The design for a hook for garment-clasps, as herein shown and described.

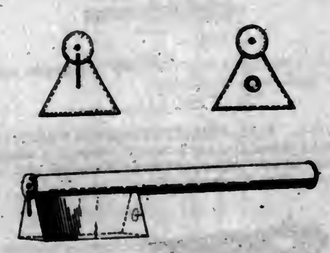
28,562. TIP FOR UMBRELLA OR PARASOL RIBS. CHARLES H. FREDERICK, Jr., New York, N. Y. Filed Mar. 15, 1898. Serial No. 673,982. Term of patent 3½ years.

Claim.—The design for the tip of an umbrella or parasol rib, substantially as shown and described.

28,563. TRUNK-SLAT. GEORGE CROUSE, New York, N. Y. Filed Dec. 20, 1897. Serial No. 663,751. Term of patent 14 years.

Claim.—The design for a trunk-slat, substantially, as shown and described.

28,564. TRUNK-SLAT. GEORGE CROUSE, New York, N. Y. Filed Mar. 17, 1898. Serial No. 674,270. Term of patent 14 years.



Claim.—The design for a trunk-slat, substantially as shown and described.

28,565. CLAMP FOR DOOR-SECURERS. ELISHA P. BRAINE, Waterville, Me. Filed Feb. 21, 1898. Serial No. 671,901. Term of patent 7 years.

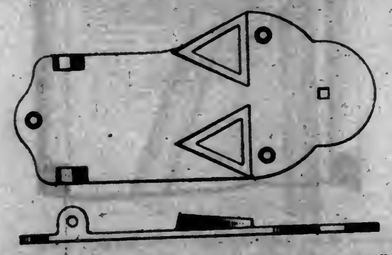
Claim.—The design for a clamp for a door-securer, substantially as herein shown and described.

28,566. HAND-SPRAYER. THOMAS A. GALE, Sterling, Ill. Filed Mar. 15, 1898. Serial No. 673,903. Term of patent 7 years.

Claim.—The design for a hand-sprayer as herein shown and described.

28,567. PLUMBER'S TRAP. LOUIS H. BRIEGMAN, Brooklyn, N. Y., assignor to the New York Pipe Bending and Machine Company, same place. Filed Jan. 22, 1897. Serial No. 620,677. Term of patent 14 years.

28,567.



Claim.—The design for a plumber's trap, substantially as shown and described.

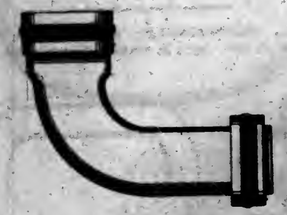
28,568. HANDLE SOCKET-PIECE FOR HAND-SCRAPERS. WILBUR B. HARRIMAN, North Chatham, N. H. Filed Mar. 30, 1898. Serial No. 675,806. Term of patent 7 years.

Claim.—The design for a handle socket-piece for hand-scrapers, herein shown and described.

28,569. SICKLE-GRINDER BASE. HARRY W. BELDEN, Port Washington, Wis. Filed Mar. 4, 1898. Serial No. 672,607. Term of patent 14 years.

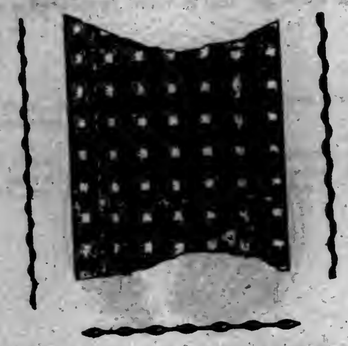
Claim.—The design for a sickle-grinder base, substantially as herein shown and described.

28,570. VALVE-DISK. JOSEPH BERES, River Forest, Ill. Filed Apr. 18, 1898. Serial No. 678,010. Term of patent 7 years.



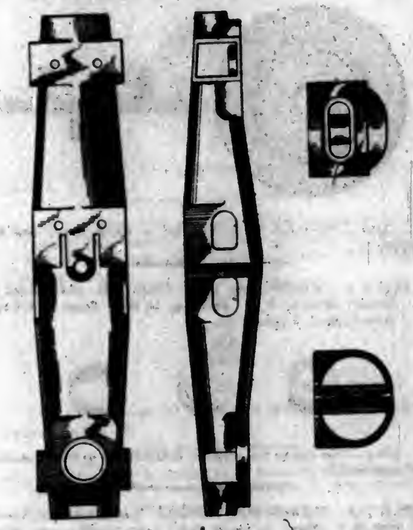
Claim.—The design for a valve-disk, as herein shown and described.

28,571. WASHER FOR THILL-COUPLINGS. CHRISTOPHER C. BRADLEY, Syracuse, N. Y. Filed Mar. 14, 1898. Serial No. 673,574. Term of patent 14 years.



Claim.—The design for a washer substantially as herein shown and described.

28,572. QUARTER-BEND COUPLING. CLARENCE H. ROSE, Watertown, N. Y., assignor to the Hitchcock Lamp Company, same place. Filed Mar. 5, 1898. Serial No. 672,757. Term of patent 14 years.

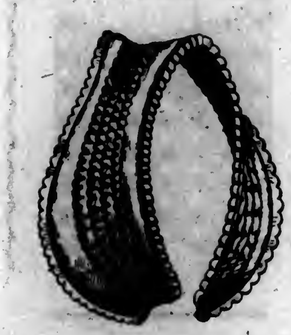


Claim.—The design for a coupling, substantially as hereinbefore described and illustrated in the accompanying drawing.

28,573. PATTERN FOR PIPE-COVERINGS. CHARLES BROOKS, New York, N. Y. Filed Aug. 31, 1897. Serial No. 649,084. Term of patent 14 years.

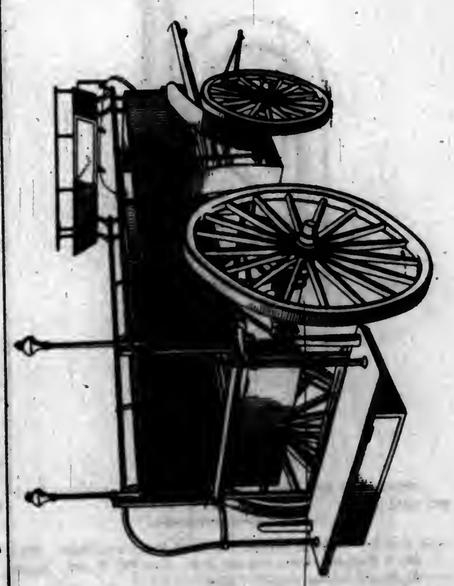
Claim.—The design for a pattern of pipe-covering, substantially as shown and described.

28,574. CAR-BOLSTER. JOHN PLAYER, Topeka, Kans. Filed Mar. 17, 1898. Serial No. 674,365. Term of patent 14 years.



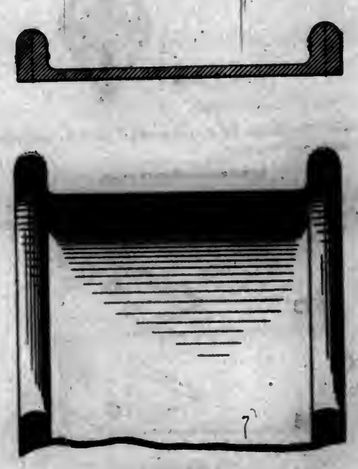
Claim.—A design for a car-bolster substantially as herein shown and described.

28,575. BOILER-DRUMHEAD. HORACE SEE, New York, N. Y. Filed Feb. 11, 1898. Serial No. 669,965. Term of patent 14 years.



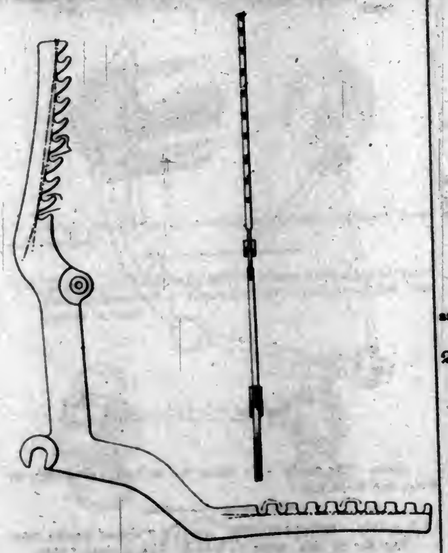
Claim.—The design for a boiler drumhead substantially as herein shown and described

28,576. SWEAT-PAD. EDWARD L. MCCLAIN, Greenfield, Ohio. Filed Nov. 20, 1897. Serial No. 659,339. Term of patent 14 years.



Claim.—The design for a sweat-pad, as herein shown and described.

28,577. FIRE-HOSE-WAGON BODY. GABRIEL STRAMER, Oshkosh, Wis. Filed Feb. 14, 1898. Serial No. 670,230. Term of patent 7 years.



Claim.—The design for a fire-hose-wagon body, substantially as herein shown and described.

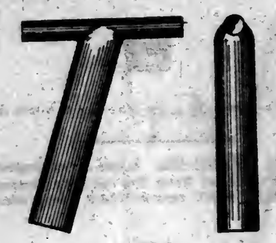
28,578. CONCENTRATOR-BAND. SAMUEL JOHNSON, San Francisco, Cal. Filed Feb. 10, 1897. Serial No. 623,263. Term of patent 14 years.

Claim.—The design for an ore-concentrator band, substantially as shown and described.

28,579. JACK-LEVER. GEORGE F. HYPOLITE, Worcester, Mass. Filed Dec. 22, 1897. Serial No. 663,369. Term of patent 14 years.

Claim.—The design for a jack-lever, substantially as shown and described.

28,580. OIL-CAN. JOSEPH W. CUSHMAN, New York, N. Y., assignor of one-half to George F. Wilkinson, same place. Filed Sept. 20, 1897. Serial No. 653,536. Term of patent 14 years.

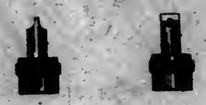


Claim.—The design for an oil-can as herein shown and described.

28,581. BICYCLE L SADDLE-POST. ERWIN G. PALMER, Cleveland, Ohio, assignor to the Standard Tool Company, same place. Filed Sept. 18, 1897. Serial No. 652,196. Term of patent 3½ years.

Claim.—The design for a bicycle L saddle-post as herein shown and described.

28,582. BICYCLE T SADDLE-POST. ERWIN G. PALMER, Cleveland, Ohio, assignor to the Standard Tool Company, same place. Filed Sept. 18, 1897. Serial No. 652,197. Term of patent 3½ years.

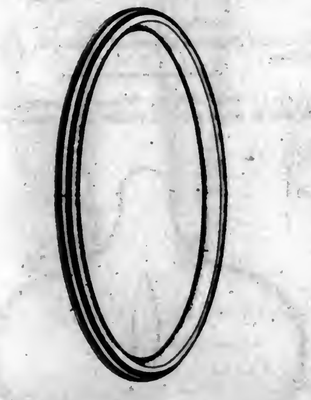


Claim.—The design for a bicycle T saddle-post, as herein shown and described.

28,583. SADDLE-SEAT. WILLIAM I. BUSHER, La Grange, Ill. Filed Mar. 31, 1898. Serial No. 675,909. Term of patent 14 years.

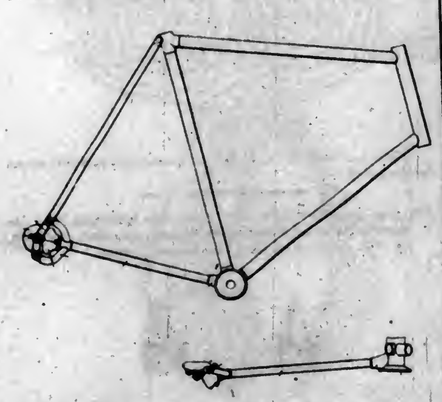
Claim.—A design for a saddle-seat substantially as herein shown and described.

28,584. TIRE-VALVE CAP. JOHN LIBBY, Waterbury, Conn., assignor to The Scovill Manufacturing Company, same place. Filed Oct. 18, 1897. Serial No. 655,639. Term of patent 7 years.



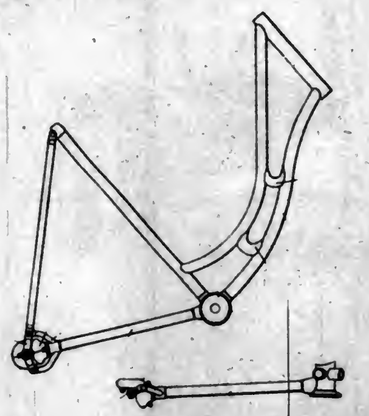
Claim.—The design for a tire-valve cap as herein shown and described.

28,585. TIRE-VALVE CAP. JOHN LIEBE, Waterbury, Conn., assignor to The Scovill Manufacturing Company, same place. Filed Oct. 18, 1897. Serial No. 655,640. Term of patent 7 years.



Claim.—The design for a tire-valve cap as herein shown and described.

28,586. ELASTIC TIRE. ROBERT COWEN, Cambridge, Mass., assignor to the Boston Woven Hose and Rubber Company, Boston, Mass. Filed Dec. 4, 1897. Serial No. 660,815. Term of patent 14 years.

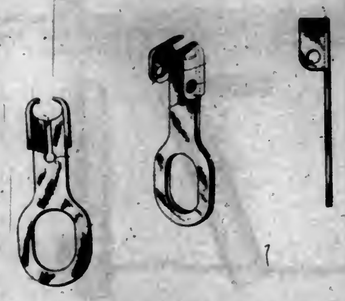


Claim.—The design for an elastic tire substantially as herein shown and described.

28,587. BICYCLE-FRAME. JAMES S. COPELAND, Hartford, Conn., assignor to the Pope Manufacturing Company, same place and Portland, Me. Filed Mar. 21, 1898. Serial No. 674,666. Term of patent 14 years.

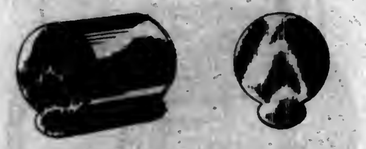
Claim.—The design for a frame for a bicycle substantially as shown and described.

28,588. BICYCLE-FRAME. JAMES S. COPELAND, Hartford, Conn., assignor to the Pope Manufacturing Company, same place and Portland, Me. Filed Mar. 21, 1898. Serial No. 674,667. Term of patent 14 years.



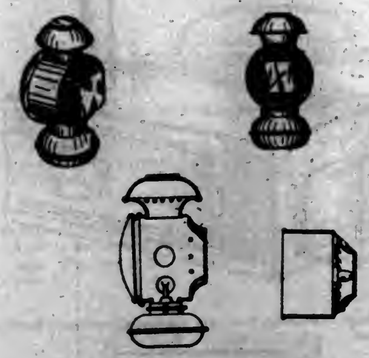
Claim.—The design for a frame for bicycles substantially as shown and described.

28,589. BICYCLE-HOLDER. HENRY S. WHEDON, Guilford, Conn. Filed Mar. 23, 1898. Serial No. 674,942. Term of patent 7 years.



Claim.—The design for a bicycle-holder substantially as herein shown and described.

28,590. CYCLOMETER-BRACKET. EDWIN HART, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Mar. 24, 1898. Serial No. 675,043. Term of patent 14 years.

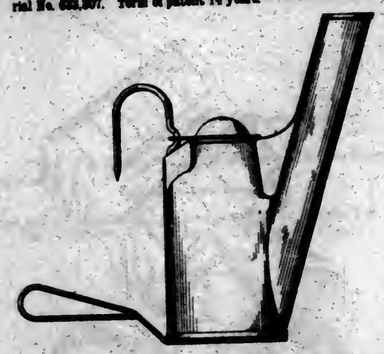


Claim.—The design for a bracket, substantially as shown and described.

28,591. CYCLOMETER-CASING. EDWIN HART, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Mar. 17, 1898. Serial No. 674,269. Term of patent 14 years.

Claim.—The design for a casing, substantially as herein shown and described.

28,592. BICYCLE-LAMP BODY. GEORGE HAVELL and ALFRED G. WILLIAMS, Newark, N. J. Filed Aug. 9, 1897. Serial No. 647,636. Term of patent 3½ years.



Claim.—The design for a bicycle-lamp body substantially as shown and described.

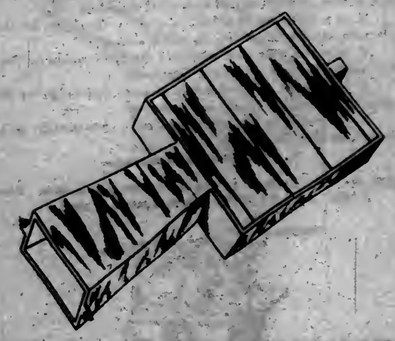
28,593. VEHICLE-LAMP. JOHN BERRIMAN, Chicago, Ill., and FRANKLIN I. WHITE, Waterbury, Conn.; said White assignor to said Berriman. Filed June 18, 1897. Serial No. 641,264. Term of patent 7 years.

Claim.—A design for a vehicle-lamp, substantially as herein shown and described.

28,594. MINER'S LAMP. ROBERT F. LOVE, Scranton, Pa., assignor of one-half to George A. Long, same place. Filed Apr. 24, 1897. Serial No. 633,307. Term of patent 14 years.

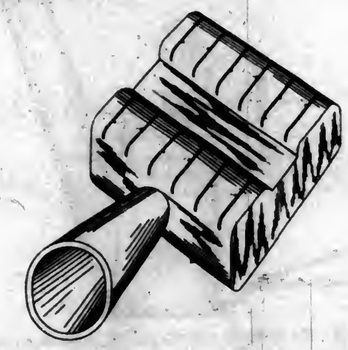
Claim.—The design for a miner's lamp as herein shown and described.

28,595. LAMP-CASE. FRANK R. SNOW, Chicago, Ill., assignor to Jennie B. Lawson, same place. Filed Oct. 8, 1897. Serial No. 654,662. Term of patent 3½ years.



Claim.—A design for a lamp-case, consisting of a sphere having a truncated cone mounted at one side and flaring outwardly, and terminating in the segment of a sphere, as shown and described.

28,596. HOLDER FOR SHADES OF INCANDESCENT LAMPS. ROBERT FARIS, Decatur, Ill. Filed Dec. 28, 1897. Serial No. 663,102. Term of patent 7 years.



Claim.—The design for a holder for shades of incandescent lamps, substantially as herein shown and described.

28,597. SHELL FOR GAS-FUEL BURNERS. FRANK P. GILLESPIE, Erie, Pa., assignor of one-half to Jos. I. Town, same place. Filed Apr. 1, 1897. Serial No. 630,302. Term of patent 7 years.

Claim.—The design for a shell for a gas-fuel burner, substantially as herein shown and described.

28,598. SHELL FOR GAS-FUEL BURNERS. FRANK P. GILLESPIE, Erie, Pa., assignor of one-half to Jos. I. Town, same place. Filed Apr. 1, 1897. Serial No. 630,303. Term of patent 7 years.

Claim.—The design for the shell of a gas-fuel burner, substantially as herein shown and described.

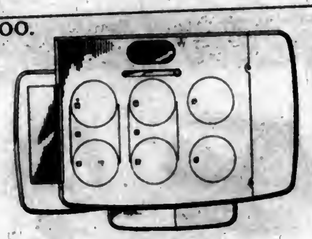
28,599. SHELF-SECTION FOR STOVES OR RANGES. BRADLEY WOODRUFF, Dunmore, Pa., assignor to the Scranton Stove Works, Scranton, Pa. Filed Feb. 25, 1898. Serial No. 671,700. Term of patent 14 years.

Claim.—1. In a design for shelf section of stove, the design for the shelf E, substantially as shown and described.

2. In a design for shelf-section of stove, the design for the smoke-pipe section, substantially as shown and described.

3. In a design for shelf-section of stove, the design for the side brackets, substantially as shown and described.

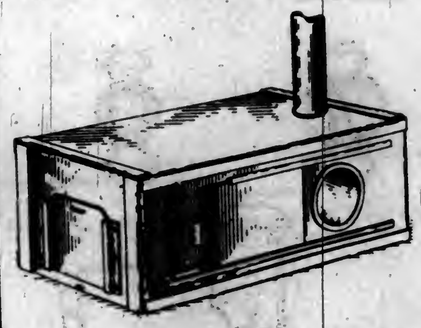
4. In a design for shelf-section of stove, the design for the back rail, substantially as shown and described.



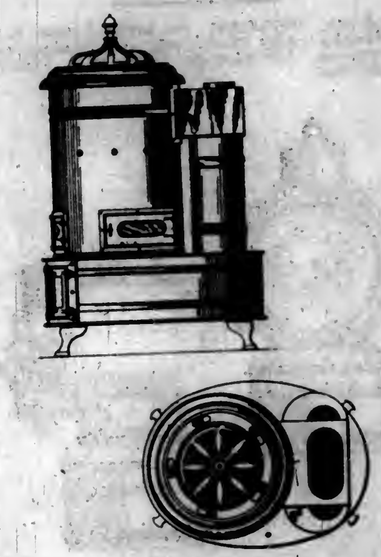
5. In a design for shelf-section of stove, the design for the top strip, substantially as shown and described.

6. The design for shelf-section of stove, substantially as herein shown and described.

28,600. RANGE. ARTHUR W. WALKER, Malden, Mass. Filed Jan. 7, 1898. Serial No. 665,979. Term of patent 14 years.

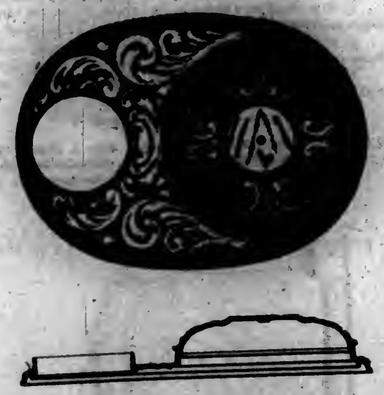


28,600.



Claim.—The design for a range, substantially such as herein shown and described.

28,601. STOVE. ALBERT R. MCMILLAN, Auburn, Wash. Filed Jan. 29, 1898. Serial No. 668,494. Term of patent 3½ years.

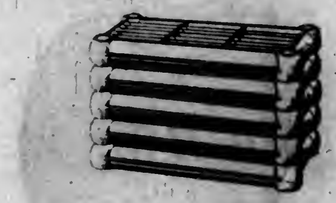


Claim.—The design for a stove, substantially as herein shown and described.

28,602. STOVE. JOHN P. LYBOYT, Louisiana, Mo. Filed Jan. 24, 1898. Serial No. 667,839. Term of patent 14 years.

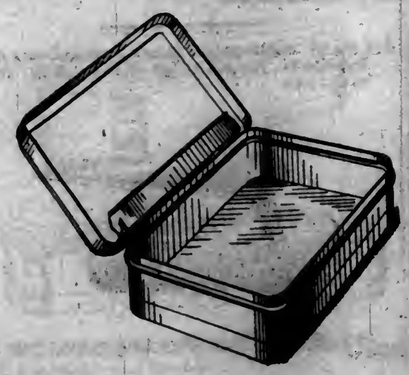
Claim.—The design for a stove, substantially as herein shown and described.

28,603. HEATER. FERDINAND S. WELLS, Quincy, Ill., assignor to the W. J. Loth Stove Company, Waynesborough, Va. Filed Mar. 21, 1898. Serial No. 674,685. Term of patent 7 years.



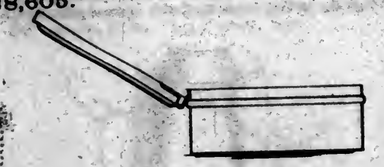
Claim.—1. In a design for a heater, the design for the top, substantially as shown and described.

2. In a design for a heater, the design for the cover, substantially as shown and described.



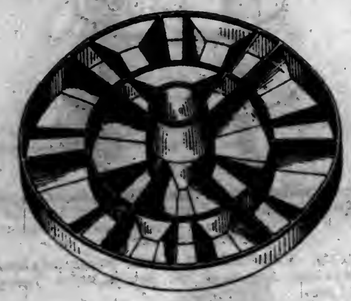
3. The design for a heater, substantially as shown and described.

28,604. RADIATOR. ARTHUR H. FOWLER, Philadelphia, Pa., assignor to the Fowler & Webb Manufacturing Company, of Pennsylvania. Filed Dec. 15, 1897. Serial No. 662,057. Term of patent 14 years.

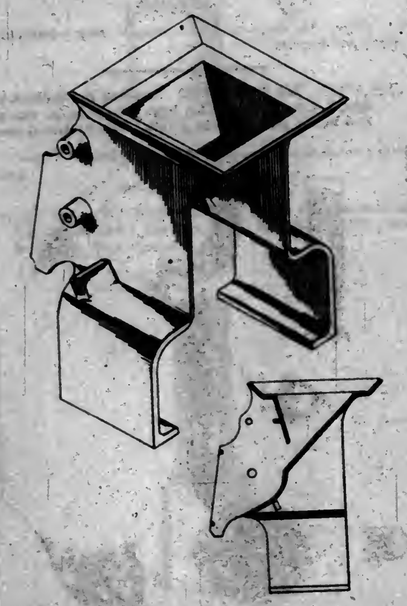


Claim.—The design for a radiator consisting of the shape or conformation substantially as herein shown and described.

28,605. SPICE-CABINET. EDWARD F. SNYDER, Brooklyn, N. Y. Filed Oct. 23, 1897. Serial No. 656,217. Term of patent 7 years.

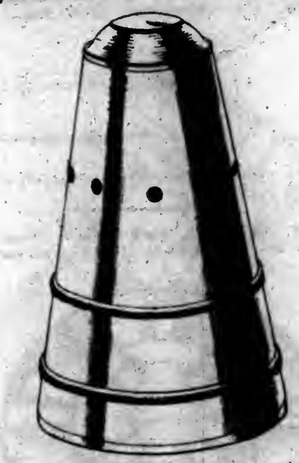


28,605.



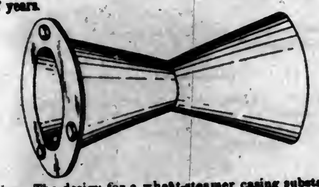
Claim.—A design for a spice-cabinet substantially as shown and described.

28,606. CHURN-DASH. JOHN R. REEVES, Jr., Vernon, Tex. Filed Feb. 10, 1898. Serial No. 669,857. Term of patent 7 years.



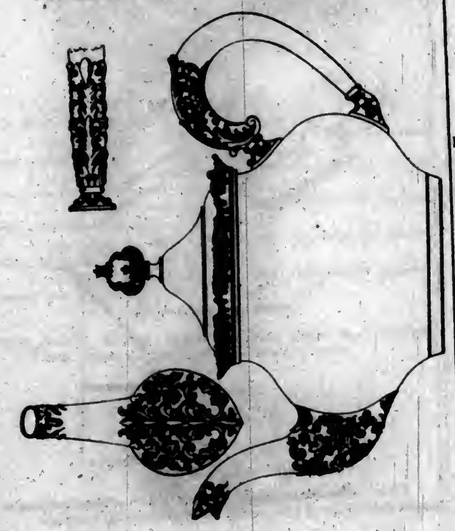
Claim.—The design for a churn-dash substantially as herein shown and described.

28,607. FRAME FOR FRUIT-SEEDING MACHINES. JOHN WILSON BROWN, Jr., Philadelphia, Pa. Filed Mar. 26, 1898. Serial No. 675,238. Term of patent 14 years.



Claim.—The design for the frame of a fruit seeding machine as herein described and as shown in the accompanying drawings.

28,608. CHOPPING-KNIFE. SYDNIA C. REEVES, Lansing, Mich. Filed Mar. 18, 1898. Serial No. 674,594. Term of patent 7 years.



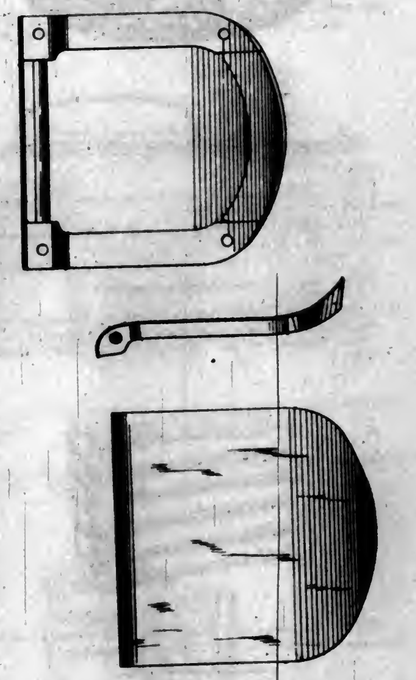
Claim.—A design for a chopping-knife substantially as herein shown and described.

28,609. WHEAT-STEAMER CASING. WILLIAM JOHN MERRIAM, Almont, Mich. Filed Nov. 24, 1897. Serial No. 659,716. Term of patent 7 years.

Claim.—The design for a wheat-steamer casing substantially as shown and described.

28,610. TEA OR COFFEE POT. FREDERICK W. VAN BERGH, Rochester, N. Y., assignor to the Van Bergh Silver Plate Co., same place. Filed Mar. 24, 1898. Serial No. 675,045. Term of patent 3½ years.

Claim.—1. In a design for a teapot or like article, the body having the shape and the ornamental band or border at the upper portion, substantially as shown and described.



2. In a design for a teapot or like article, the top having the shape and ornamentation, substantially as shown and described.

3. In a design for a teapot or like article, the handle having the shape and ornamentation, substantially as shown and described.

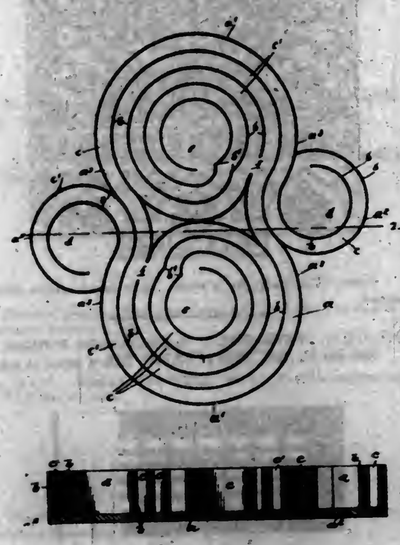
4. In a design for a teapot or like article, the spout having the shape and ornamentation, substantially as shown and described.

5. The design for a teapot or like article, substantially as herein shown and described.

28,611. BENT-WOOD CHAIR-SEAT. FRED A. DESSERT, Sheboygan, Wis. Filed Feb. 16, 1898. Serial No. 670,867. Term of patent 14 years.

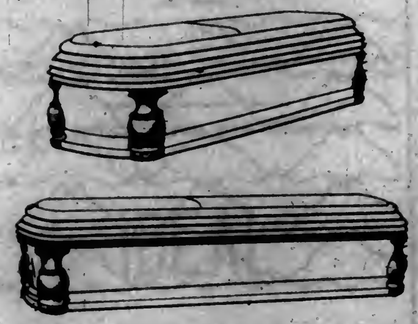
Claim.—The design for a bent-wood chair-seat, substantially as herein shown and described.

28,612. IRONING-BOARD. ERWIN F. BROWN and HARRY E. JOHNS, Homestead, Pa. Filed Sept. 17, 1898. Serial No. 692,186. Term of patent 7 years.



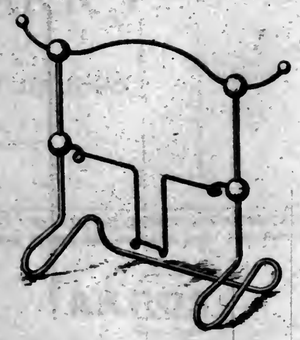
Claim.—The design for an ironing-board as herein shown and described

28,613. PACKING-JAR. ROBERT PEARSON, Brenham, Tex. Filed Feb. 18, 1898. Serial No. 670,864. Term of patent 14 years.



Claim.—The design for a packing-jar for cigars, substantially as herein shown and described.

28,614. PUZZLE-BOX. HIRAM C. GLAZIER, West Winfield, N. Y. Filed Jan. 6, 1898. Serial No. 666,864. Term of patent 3½ years.



Claim.—The design for a puzzle-box, as herein shown and described.

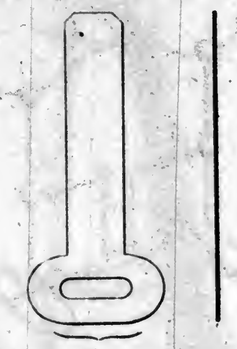
28,615. BURIAL-CASKET. STANLEY REYNOLDS, Rochester, N. Y., assignor to the Stein Casket Company, New York, N. Y. Filed Feb. 5, 1898. Serial No. 669,375. Term of patent 3½ years.

Claim.—The design for a burial-casket having a pilaster substantially as herein shown and described.

28,616. FRAME FOR LOOKING-GLASSES. BENJAMIN F. STARNES, Chicago, Ill., assignor to Gabe Feisenthal, same place. Filed Jan. 22, 1898. Serial No. 667,854. Term of patent 7 years.

Claim.—The design for a frame for looking-glasses or similar articles, substantially as shown and described.

28,617. ADVERTISING-COLUMN. ALBERT GERSTENDORFER and MAX GERSTENDORFER, New York, N. Y. Filed Mar. 17, 1898. Serial No. 674,261. Term of patent 3½ years.

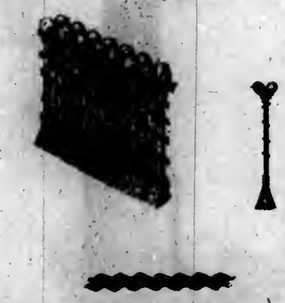


Claim.—The design for an advertising-column, as shown and described.

28,618. ADVERTISING-COLUMN. ALBERT GERSTENDORFER and MAX GERSTENDORFER, New York, N. Y. Filed Mar. 17, 1898. Serial No. 674,262. Term of patent 3½ years.

Claim.—The design for an advertising-column, as shown and described.

28,619. TAG. JAMES FRANKLIN MCFADDEN, Philadelphia, Pa., assignor to George H. McFadden & Brother, same place. Filed Feb. 7, 1898. Serial No. 669,453. Term of patent 7 years.



Claim.—A design for a tag, substantially as herein shown and described.

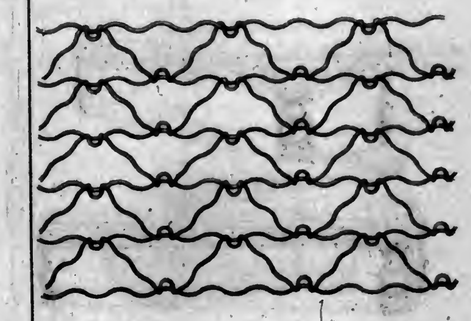
28,620. CURTAIN. FLORA V. REAM, Somerset, Ohio. Filed June 28, 1897. Serial No. 642,754. Term of patent 7 years.

Claim.—The design for a curtain herein shown and described.

28,621. FRINGE. CARL F. BUECHNER, New York, N. Y. Filed Mar. 25, 1898. Serial No. 675,189. Term of patent 7 years.

Claim.—The design for fringe, substantially as herein shown and described.

28,622. WOVEN FABRIC. CHARLES FRAHS, New York, N. Y., assignor to A. A. Vantine & Co., same place. Filed Mar. 1, 1898. Serial No. 672,208. Term of patent 3½ years.



Claim.—The design for a woven fabric herein shown and described.

28,623. WOVEN FABRIC. SAMUEL BOTTOMLEY, Providence, R. I. Filed Mar. 31, 1898. Serial No. 675,902. Term of patent 14 years.

Claim.—The design for woven fabric herein shown and described.

28,624. PATTERN FOR WIRE FABRIC. CHARLES G. SMITH, Detroit, Mich. Filed Nov. 23, 1897. Serial No. 659,637. Term of patent 14 years.

Claim.—The design for a pattern for wire fabric substantially as herein shown and described.

TRADE-MARKS

REGISTERED MAY 10, 1898.

81,515. WRITING PAPER. WRITING PAPER COMPANY, Holyoke, Mass. Filed Mar. 8, 1898.

CLINGSTONE

Essential feature.—The word "CLINGSTONE." Used since October, 1881.

81,516. CERTAIN NAMED PUBLICATIONS. LEOPOLD GENSLE, Chattanooga, Tenn. Filed Jan. 28, 1898.

ST JOSEPH'S

Essential feature.—The abbreviation and word "ST. JOSEPH'S." Used since January 1, 1890.

81,517. COLLARS AND CUFFS. FRED R. FAY, Los Angeles, Cal. Filed Mar. 11, 1898.

Essential feature.—The compound word "NO-SAW-EDGE." Used since November 15, 1895.

81,518. BOYS' TROUSERS. A. SHUMAN & Co., Boston, Mass. Filed Mar. 3, 1898.

Cavalry Knee and Seat

Essential feature.—The words "CAVALRY KNEE AND SEAT." Used since February 14, 1898.

81,519. LEATHER. GEORGE S. WOLFF, Philadelphia, Pa. Filed Feb. 17, 1898.

IDEAL

Essential feature.—The word "IDEAL." Used since July, 1897.

81,520. VARNISH FOR INTERIOR AND EXTERIOR FINISHING. THE AKRON VARNISH COMPANY, Akron, Ohio. Filed Mar. 11, 1898.

AKROS

Essential feature.—The word "AKROS." Used since November, 1895.

81,521. FIRE-EXTINGUISHING COMPOUNDS AND RECEPTACLES THEREFOR. MECHANICAL FIRE APPLIANCE CO., New York, N. Y. Filed Feb. 2, 1898.

Kilfyre

Essential feature.—The word "KILFYRE." Used since December 1, 1897.

81,522. CEMENT FOR UNITING VARIOUS MATERIALS AND ARTICLES. MCCAW, STEVENSON & ORR, Limited, Belfast, Ireland. Filed Feb. 26, 1898.

"SECCOTINE"

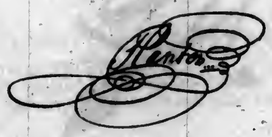
Essential feature.—The word "SECCOTINE." Used since March, 1891.

81,523. DYNAMITE, DYNAMITE-CARTRIDGES, BLASTING-GELATIN, DETONATING CAPS, AND FUSES. THE ATLAS POWDER COMPANY, Atlas, Ind., and Chicago, Ill. Filed Mar. 9, 1898.

LION

Essential feature.—The word "LION." Used since November 1, 1897.

81,524. PORTLAND CEMENT. TRETOHIA MESSTORFER PORTLAND CEMENTWERK, Hintburg, Germany. Filed Mar. 10, 1898.



Essential feature.—A representation of the Hermann monument. Used since August 28, 1897.

81,525. CAPSULES. JOHN RUTGERS PLANTEN, New York, N. Y. Filed Jan. 12, 1898.

PLANTENS

Essential feature.—The word "PLANTEN'S" or its equivalent in any of the European languages. Used since 1836.

81,526. CAPSULES. JOHN RUTGERS PLANTEN, New York, N. Y. Filed Jan. 12, 1898.

Essential feature.—The name "PLANTEN." Used since 1836.

81,527. INTESTINAL ASTRINGENTS. FARBENFABRIKEN OF ELBERFELD COMPANY, New York, N. Y. Filed Mar. 5, 1898.

TANNOPINE

Essential feature.—The word "TANNOPINE." Used since February 1, 1898.

81,528. MEDICINAL PREPARATIONS HAVING ANTISEPTIC QUALITIES. CHARLES V. RYAN, Springfield, Mass. Filed Mar. 9, 1898.

MODOFORMAL

Essential feature.—The word "MODOFORMAL." Used since February 1, 1898.

81,529. LIQUID COUGH MEDICINE. CLARENCE S. MCILVEE, Columbus, Ohio. Filed Mar. 5, 1898.

EAGLE

Essential feature.—The word "EAGLE," the letters forming this word being arranged in vertical alinement one above the other, and the word thus produced being intersected centrally by the same word, the letters of which are arranged in horizontal alinement, the central letter "G" serving for both words. Used since February 1, 1898.

81,530. DYSPEPSIA-PADS AND PADS FOR CURE OF DISEASE BY ABSORPTION. CHARLES DEYOUNG, Philadelphia, Pa. Filed Feb. 18, 1898.

Essential feature.—A view of a terrestial globe having in front an oviform pad represented as quilted into a series of quadrangular cushions, the word "GUTTERMAN" inscribed above the quilted pad and "DYSPEPSIA PAD" below it. Used since January 22, 1898.

81,531. LIQUID REMEDY FOR DIARRHŒA, DYSENTERY, AND DYSPEPSIA. SLOAT BROS. Co., Valdosta, Ga. Filed Feb. 14, 1898.

Essential feature.—A picture of Underhill H. Sloat, a deceased member of the firm. Used since August 1, 1897.

81,532. COLIC AND LUNG-FEVER CURE. WILLIAM O. BROWNE, Lumberton, N. C. Filed Mar. 10, 1898.

Essential feature.—A picture of the registrant, holding in the left hand the bottom half of a carton, a bottle, and a syringe. Used since February 15, 1898.

81,533. CERTAIN NAMED MEDICAL COMPOUNDS. Leavell & Gentle, Chattanooga, Tenn. Filed Jan. 26, 1898.

ST. JOSEPH'S

Essential feature.—The abbreviation and word "St. JOSEPH'S." Used since January 1, 1892.

81,534. MEDICATED OINTMENT FOR THE SKIN. JOHNSON, HOLLOWAY & Co., Philadelphia, Pa. Filed Feb. 24, 1898.

HEBERELL

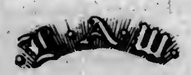
Essential feature.—The word "HEBERELL." Used since February 4, 1880.

81,535. SOAP. VEUVE CHARLES MORRE, Marseilles, France. Filed Mar. 27, 1897.

LA BONNE MERE

Essential feature.—The words "LA BONNE MERE." Used since 1865.

81,536. STARCH. JACOB J. HEMMEDER, New Haven, Conn. Filed Feb. 8, 1898.



Essential feature.—The representation of a washtub. Used since June, 1897.

81,537. CANDY. GREGORY L. HEBERDEN, Boston, Mass. Filed Jan. 26, 1898.

Essential feature.—The representation of a monkey. Used since October, 1894.

81,538. WHISKY. BOYLE & MCGLEIN, Philadelphia, Pa. Filed Mar. 9, 1898.

Essential feature.—The letters "L. A. W." Used since November 1, 1897.

81,539. BOTTLES. JEFFERIS GLASS WORKS, Fairton, N. J., and Philadelphia, Pa. Filed Feb. 14, 1898.

"BRILLIANTINE"

Essential feature.—The word "BRILLIANTINE." Used since May 1, 1896.

81,540. LAMP-CHIMNEYS. THOMAS EVANS COMPANY, Pittsburg, Pa. Filed Feb. 26, 1898.

ZENITH

Essential feature.—The word "ZENITH." Used since May 15, 1895.

81,541. PIANOFORTES AND ORGANS. PEMBER & SMITH, New York and Saratoga Springs, N. Y.; Washington, D. C.; Jersey City, Newark, and Paterson, N. J.; Chicago, Ill., and Kansas City, Mo. Filed Mar. 11, 1898.

Imperial

Essential feature.—The word "IMPERIAL." Used since March, 1878.

81,542. IRONING-MACHINES. FRED B. FAY, Los Angeles, Cal. Filed Mar. 11, 1898.

Essential feature.—The compound word "SAW-EDGE." Used since November 15, 1895.

81,543. PNEUMATIC TIRES. MORGAN & WRIGHT, Chicago, Ill. Filed Mar. 10, 1898.

CACTUS

Essential feature.—The word "CACTUS." Used since February 12, 1896.

81,544. PNEUMATIC TIRES. MORGAN & WRIGHT, Chicago, Ill. Filed Mar. 10, 1898.

PLANK ROAD

Essential feature.—The words "PLANK ROAD." Used since July 14, 1897.

THE NORRIS PEULIS CO.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

Erratum.

OFFICIAL GAZETTE, vol. 83, No. 5, May 3, 1898, Decisions of the Commissioner, *Hammond* v. *Hart*, p. 746, second column, line 16, the word "Neither" should read *Either*.

COMMISSIONER'S DECISIONS.

EX PARTE KEYSER.

Decided February 24, 1898.

DIVISIONAL APPLICATION—ADDITIONAL FUNCTION.

In a divisional application a mere enlargement or extension of a certain feature whereby an additional function or capability is given the apparatus may be permitted.

ON petition.

ELECTRICALLY-ACTUATED SAFETY DEVICES FOR ELEVATORS.

Application of Nelson B. Keyser filed October 29, 1897, No. 656,779.

Mr. Marcus B. May for the applicant.

GREELEY, *Assistant Commissioner:*

This application is asserted by the petitioner to be a division of an application filed earlier disclosing several species of his device. The drawings of this application are identical with the drawings of the original application, so far as the particular species disclosed is concerned. The description is also identical with the description in the original application, so far as the construction and operation are concerned, except in one particular. In the original application the contact-strip on the car through which the circuit is closed to the clutching device by which the starting and stopping rope is gripped is not stated to be of any particular length, either long or short, but is shown as less in length than the length of the car, though much more than a mere contact. In the present application it is stated that it may, if desired, be of the full length of the car.

In the original application the use of this contact is stated to be to keep the circuit closed through the clutching device so long as the landing-door remains open, so that the starting-rope will be held from movement and the car cannot be started either up or down until the door is closed. In the present application it is stated to have this use and in addition is stated to be for the purpose of closing the circuit through the clutching device to cause it to operate to grip the rope and prevent the further movement of the car.

It is evident that the device as shown and described in the original application has every function which is stated in the present application, the extent of the space through which it is capable of acting being considerable, but necessarily limited by the length of the contact. Obviously lengthening the contact lengthens the space through which the device is capable of acting. It follows that the length of the contact-strip may be varied as desired. A statement of so obvious a modification would not involve new matter if made in the original application and does not involve new matter in the present application.

The present application is properly stated to be a division of the earlier application, and the requirement made by the Examiner that this statement should be eliminated is overruled.

The petition is granted.

EX PARTE CLARK-JEWELL-WELLS CO.

Decided February 24, 1898.

1. TRADE-MARK—CLASSES OF GOODS—SEPARATE REGISTRATION.

The Office is not warranted in requiring that a trade-mark be separately registered for each class of goods with which it is used in order to conform to the Office classification.

2. SAME—SAME—LENGTH OF USE ON DIFFERENT GOODS.

Where a trade-mark used on several classes of goods is covered by a single registration, the applicant should state for each class of goods the length of time the trade-mark has been used for that class.

ON petition.

TRADE-MARK FOR GROCERIES.

Application for registration filed October 9, 1897.

Mr. J. F. Beale for the applicant.

GREELEY, *Assistant Commissioner:*

This is a petition taken from the action of the Examiner of Trade-Marks requiring the applicant to limit the goods to which his mark is applied to one class.

It is stated in the application that the mark has been applied to groceries, and the particular goods said to be included in that class are "canned goods, flour, tobacco, cigars, dried fruit, condiments, farinaceous foods, flavoring extracts, coffee, and lard, hams, bacon, and canned beef." The Examiner states that if so many different kinds of goods are allowed to be covered by one registration confusion in the Office classification will result. Under the statute the Office should not register a mark which has been previously registered to some other applicant for the same class of goods, and in order to prevent this duplication in registration it is nec-

essary that the Office observe some form of classification.

The petitioner urges that there is no authority of law for the requirement of division in trade-mark applications to conform to the Office classification and cites in support of his position *ex parte Silvers*, (67 O. G., 811.)

Office classification of trade-marks is necessary in order to determine whether or not a trade-mark presented for registration has been before registered, and it is desirable for the purposes of such classification that a trade-mark be registered only for a particular class of goods. Yet there is not the necessity for requiring that the application for registration be so restricted that exists for restricting an application for patent to a single invention. But one trade-mark may be covered by a single registration; but, however desirable it may be, the Office is not warranted in requiring that the trade-mark be registered for but one class of goods. To require that a trade-mark be registered for each class of goods with which it is used—in the present case to require that the trade-mark be registered separately for five different classes of goods at an expense of five fees—would be a most onerous requirement.

The applicant should, however, be required to state for each class of goods the length of time for which the trade-mark has been used for that class of goods.

Subject to this requirement the petition is granted.

FOREIGN PATENT LAWS.

Condensed Statement of the Conditions and Formalities Required in the Principal Industrial Countries for Obtaining a Patent of Invention.

[*From La Propriété Industrielle of August 31, 1897.*]

UNITED STATES PATENT OFFICE,
May 2, 1898.

La Propriété Industrielle, the official organ of the International Union for the Protection of Industrial Property, in the number for August, 1897, contains a comparative tabular statement in condensed form of the conditions and formalities requisite for obtaining a patent in certain foreign countries.

For the information of the Patent Office and those inventors who may seek protection for their inventions in foreign countries this condensed statement, together with the explanatory note which accompanies it, has been translated at the Scientific Library of this Office, and the translation, after having been carefully revised, is herewith published.

The statement has in case of each of the countries considered been carefully compared with the patent law and requirements of that country, and in this work of comparison and revision the Patent Office has had the assistance of attorneys familiar with practice before the patent offices of the several countries. The Patent Office cannot, however, vouch for the accuracy of the statement in all details.

The fact that a patent can be obtained in those countries in which patents are granted without preliminary examination does not necessarily mean that such patent is valid or even likely to be valid. If the invention is new and is in other respects patentable under the law of the particular country and the prescribed formalities are complied with in applying for patent, the patent will be valid; otherwise, though granted in due form and bearing the Government seal, it is invalid.

The publication of a United States patent or even the publication of so much of a patent as is usually published in THE OFFICIAL GAZETTE, if prior to the application for patent in a foreign country, may, and in some countries does, invalidate the patent granted on such application.

The countries hereinafter referred to in which no preliminary examination as to novelty is provided for by law are:

Belgium,
Brazil,
France,
Germany, (Gebrauchsmuster,)
Great Britain,
Italy,
Mexico,
Portugal,
Russia,
Spain,
Switzerland,
Tunis.

The countries included by *La Propriété Industrielle* in the tabular statement are the principal European countries, together with Brazil and Tunis, both of which are members of the International Union. To these has been added a condensed statement with regard to Canada, Japan, and Mexico. The members of the International Union (Convention of Paris of March 20, 1883) are:

Belgium,
Brazil,
Denmark, with the Färöe Islands,
Dominican Republic,
France, with Algeria and the French colonies,
Great Britain, with New Zealand and Queensland,
Italy,
The Netherlands, with Dutch East Indies, Surinam, and Curacoa,
Norway,

Portugal, with the Azores and Madeira,
Servia,
Spain, with Cuba, Porto Rico, and the Philippines,
Sweden,
Switzerland,
Tunis,
United States.

The essential features of the Union are that, so far as patents for invention are concerned, the subjects or citizens of each country shall enjoy in all the other countries of the Union the same privileges which are accorded by the laws of the respective countries to their own subjects or citizens (Art. 2) and that a person who has regularly applied for a patent in one of the countries of the Union shall have a "right of priority" of six months (for countries over seas seven months) within which he may make application in other countries of the Union (Art. 4)—that is, six months (or seven months, as above) within which he may publish or exploit his invention without forfeiting his right to a patent.

To the statement as contained in *La Propriété Industrielle*, statements as to the requirements of the several countries in respect to working—that is, the commercial production of the invention in the country—have been added.

The taxes referred to in the statement are required in most of the countries mentioned to be paid in advance, though in some of the countries a short period of grace is allowed on payment of a fine.

Reference to the volume and page in which the full text of the various laws, if published in THE OFFICIAL GAZETTE, may be found have been inserted.

C. H. DUELL,
Commissioner.

EXPLANATORY NOTE.

"The International Bureau frequently receives letters from inventors asking it to indicate for a whole series of countries—often even for all countries—the formalities and conditions which must be complied with in filing an application for a patent. It is impossible to answer such requests in a satisfactory manner. Without counting that it would be difficult to reproduce every time the whole of the legislative and executive regulations in force in the countries in question, it would be necessary, further, to explain the administrative and judicial practice that has grown up in each of the countries. Moreover, the inventor should possess the technical knowledge necessary for describing his invention correctly and for preparing the necessary drawings, and he ought to know different languages sufficiently well to draw up the documents required. Even then he would be prevented from himself filing his application for a patent abroad, by reason of the provision found in a large number of laws which requires persons residing abroad to apply for their patents through a representative residing in the country.

"While instructing its correspondents to the best of its ability, the International Bureau has often thought that it ought to call their attention to the dangers to which they expose themselves in drawing up their applications themselves. It places itself at the same point of view as the Patent Office of the United States, which says in Article 17 of its Rules:

"The applicant is advised, unless familiar with such matters, to employ a competent attorney, as the value of patents depends largely upon the skilful preparation of the specification and claims.

"The table published hereinafter has therefore not for its purpose to put inventors in a position to themselves prepare their applications for patents. It is meant simply to let them form an exact idea of the various laws and their requirements. Moreover, the indications of this table, detailed as they are, do not always literally reproduce the requirements of the laws and regulations relating to the delivery of patents. It would be well, therefore, to refer to the original texts. The complete legislation of all countries is found in the *Recueil de la Législation et des Traités Concernant la Propriété Industrielle*, published by the International Bureau."

AUSTRIA.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)*

[Law of January 11, 1897. The date of its going in force is not yet fixed.]

WHO MAY OBTAIN A PATENT.

The author of the invention or his representative has sole right to a patent. The first applicant is considered as author of the invention until the contrary is proved.

Persons not residing in Austria must appoint a representative residing in that country.

PATENTABLE INVENTIONS.

New inventions susceptible of industrial application.

An invention is not considered new if before the date of the filing of the application for a patent it had already—

First, been described in a printed publication in Austria in such manner as to render possible its use by those skilled in the art;

Second, been used, put on exhibition, or presented in the country in a sufficiently public manner to render possible its use by those skilled in the art;

Third, been the object of a patent granted in Austria subsequently lapsed into the public domain.

INVENTIONS EXCLUDED FROM PROTECTION.

First. Inventions whose object or use is contrary to the laws, immoral, or injurious to health, or that tend evidently to lead the public into error.

Second. Scientific theories or principles as such.

Third. Inventions whose object is reserved to the monopoly of the State.

Fourth. Inventions of—

(*a*) Food products and objects of consumption (*Genussmittel*) for the human race;

(*b*) Medicines and disinfectants;

(*c*) Products obtained by chemical means. But inventions mentioned under *a* to *c*, if they relate to a particular technical process, may be patentable.

NATURE AND DURATION OF THE PATENT—TAXES.

Four kinds of patents:

First. Patents of invention. Duration, fifteen years, to start from the date on which the application for a patent was published in the *Patent Journal*.

Second. "Patents of addition." Same duration as the principal patent to which they refer.

Third. "Patents of exposition." Granted under conditions to be determined by an ordinance of the Minister of Commerce, for insuring temporary protection to patentable inventions figuring at expositions. Duration, from the admission of the object to the exposition until three months after the close of the same.

Fourth. "Patents of transformation." Granted to owners of patents issued under the old law who desire to have the same transformed into patents under the new law, if the invention is patentable under the latter. They have the same duration as patents of invention, deducting the time already elapsed under the patent granted under the old law.

Patents of invention that cannot be exploited without entire

*Austria-Hungary signified its adhesion to the International Convention in 1897, subject to the approval of parliament.

or partial utilization of another invention already patented are designated by the name of "dependent patents."

Patents of invention, filing fee, 10 florins.

Annual taxes:	*Florins.*
First year	20
Second year	25
Third year	30
Fourth year	40
Fifth year	50
Sixth year	60
Seventh year	80
Eighth year	100
Ninth year	120
Tenth year	140
Eleventh year	160
Twelfth year	220
Thirteenth year	260
Fourteenth year	300
Fifteenth year	340

"Patents of addition," 25 florins, besides the filing fee.

Florin=$0.40.

APPLICATION—FORMALITIES AND DOCUMENTS.

The application must be addressed to the Patent Office and contain, first, the full name (name and given name) of the applicant and, if necessary, that of his representative, as well as their professions and residences; second, a request for the grant of a patent; third, the title of the invention; fourth, a statement of the number of years for which the tax is to be paid before the delivery of the patent.

With this must be deposited, first, the filing fee of ten florins, or a certificate showing that this amount has been sent by mail; second, the power of attorney to the representative, if necessary; third, two copies of the description of the invention, signed by the applicant or his representative.

The description of the invention must, first, describe the invention in such manner that it can be executed; second, group the characteristic elements of the invention in one or more claims; third, include the drawings, in duplicate, on tracing-cloth, necessary for understanding the description, and be accompanied, if needed, by the necessary models and samples.

MODELS.

The filing of models and samples is obligatory only when necessary for understanding the description of the invention.

THE GRANT.

First. Preliminary examination bearing on the patentability of the invention.

Second. Publication of the application, with call for opposition. Time allowed for opposition, two months.

In case of rejection of application or in case of allowance of a contested application the interested party may appeal, within a month, to the Patent Office, Division of Appeals.

WORKING.

Patented invention must be commercially produced in Austria at the latest within three years from the date of publishing the grant in the *Patent Journal*, and working must not be discontinued for more than two years; but the forfeiture of a patent cannot take place unless preceded by an official summons and warning of forfeiture unless adequately worked within a stated period.

BELGIUM.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of May 24, 1854. 4 O. G., 263.]

WHO MAY OBTAIN A PATENT.

The patent is granted to the inventor or his assignee.

PATENTABLE INVENTIONS.

Every discovery or improvement susceptible of being exploited as an article of industry or commerce. To obtain a valid patent, application must be made before public use in Belgium or description in a printed publication. Description in a printed publication due to requirement of law will not invalidate a "patent of importation."

NATURE AND DURATION OF THE PATENT—TAXES.

Three kinds of patents:

First. Patents of invention. Duration, twenty years, to start from the date of filing.

Second. "Patents of importation." Duration limited always by that of the patent for the same invention previously granted abroad for the longest term, but in no case to exceed twenty years.

Third. "Patents of improvement." They end at the same time with the principal patent to which they relate.

First annuity, 10 francs; second annuity, 20 francs, and so on, with an increase of 10 francs for each year.

No fee is required for "patents of improvement" if granted to the grantee of the principal patent.

Franc=$0.193.

APPLICATION—FORMALITIES AND DOCUMENTS.

The applicant must file at the office of one of the provincial governments or at the office of a district commissary an application accompanied by the following, under sealed envelope:

First. The description of the invention.

Second. The drawings, models, or specimens necessary for understanding the description.

Third. A duplicate, suitably certified to conform with the original of the description and the drawings.

Fourth. A memorandum of the documents filed.

The above must all be dated and signed.

There must be annexed to this deposit the receipt for the first annuity of 10 francs.

The application must be in the French, Flemish, or German language. If not in the French language, it must be accompanied by a translation in French if the applicant is not domiciled in Belgium, must indicate the name, given names, profession, and residence, real or elected, of the inventor in Belgium, and give an exact and concise title of the invention. The description must give complete knowledge of the invention and conclude with definite claims. The drawings, in duplicate, on tracing-cloth, must be in ink and on the metric scale and indicate by a different shade the characteristic parts of the invention. All the parts of the application except the drawings must be signed by the applicant or his representative, whose power of attorney must be filed.

MODELS.

The applicant need file samples only when they are necessary for understanding the description.

THE GRANT.

The patents are granted without preliminary examination.

WORKING.

Patented invention must be worked in Belgium within a year from beginning of working elsewhere and must not be discontinued for more than one year.

BRAZIL.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of October 14, 1892. 23 O. G., 193.]

WHO MAY OBTAIN A PATENT.

The patent may be issued to the inventor or his assignee, but must be applied for by the inventor.

PATENTABLE INVENTIONS.

Requisites of patentable inventions: The inventions of new industrial products; of new means or of the new application of known means for obtaining an industrial result; the improvement of an invention already patented, if it renders easier the manufacture of the product or the use of the patented invention or increases its utility.

Inventions will be considered new which have not been employed or practiced, in Brazil or abroad, previous to the application for the patent, nor described or published in any country in such a way as to enable them to be put in practice.

The right of the inventor who has received a patent abroad and who applies for a patent in Brazil within seven months from the date of the foreign application, while satisfying the conditions and formalities established for applying for a patent, will not be invalidated by application by another, the publication of the invention, or its being employed or put in practice during such period.

INVENTIONS EXCLUDED FROM PROTECTION.

Inventions, first, contrary to law and morality; second, dangerous to public security; third, injurious to public health; fourth, not producing a practical result.

NATURE AND DURATION OF THE PATENT—TAXES.

Three kinds of patents:

First. Patents of invention. Duration, fifteen years. In case of an invention previously patented abroad, the patent will have the same duration as the original patent, without, however, exceeding fifteen years.

Second. "Patents of improvement." Same duration as the principal patent to which they refer.

Third. Provisional patents, for inventors who before applying for a definite patent wish to experiment on their inventions in public or exhibit them at an official exposition or an officially recognized exposition. The term of protection shall not exceed three years. (Similar to U. S. caveat.) Specification must be published in full in the *Diario Official* at expense of patentee.

Taxes: Patents of invention, first year, 20 dollars; second year, 30 dollars, and so on, with an annual increase of 10 dollars; "patents of improvement," single tax corresponding to the annuity to fall due.

APPLICATION—FORMALITIES AND DOCUMENTS.

Documents to be deposited with the Section of the Public Archives:

First. Application for patent stating the name, nationality, profession, domicile, or temporary residence of the applicant, the nature of the invention, and the object of its application, signed by the applicant or his agent.

Second. In duplicate, specification of the invention, under dated and sealed envelope, describing the invention, its object and method of use, with the plans, drawings, models, and samples necessary for understanding the invention and the specification. The specification must be sufficiently clear for a competent person to be able to practice the invention. It must end by specifying with clearness and precision the characteristic feature of the invention. The indications of weights and measures must be given according to the metric system, those relating to temperature according to the centigrade thermometer, those relating to density according to specific gravity. The plans and drawings must be in duplicate and executed on thick white paper not doubled or pieced, in permanent black ink. The sheets must be thirty-three centimeters high by twenty-one, forty-two, or sixty-three centimeters wide, with a rectangular frame traced in double lines and leaving a margin of two centimeters on the outside. The serial number of the sheets and the signature of the inventor must be within the marginal lines. When it is a question of an improvement, the drawings will indicate by means of

an ink of the same color, but by different lines—broken or dotted lines—the modifications added to the principal invention.

Third. A power of attorney, duly legalized, if the application is not filed by the inventor himself.

Fourth. The original patent or an official copy if it is a question of the confirmation of a foreign patent.

Fifth. The original patent if it is a question of an improvement made by the patentee on his own invention.

Sixth. An attestation relative to the principal patent if it is a question of the improvement of an invention of a third party.

Seventh. A memorandum of the documents deposited.

Documents must be in the Portuguese language.

MODELS.

Models and samples need be filed only when indispensable for understanding the invention.

THE GRANT.

The patent is delivered without preliminary examination, unless the invention relates to food products, chemicals, or drugs. In such case the government orders a preliminary examination at the cost of the applicant.

In case of rejection the applicant may appeal to the Council of State.

WORKING.

Patented invention must be worked in Brazil within three years from date of issue, and working must not be suspended for more than a year.

CANADA.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)

[Laws of June 14, 1872, 2 O. G., 31, and July 9, 1892, 65 O. G., 137.]

WHO MAY OBTAIN A PATENT.

The inventor, his executor, administrator, or assign. Application must be made by the inventor, if living.

PATENTABLE INVENTIONS.

Any new and useful art, machine, manufacture, or composition of matter or any improvement on any art, machine, manufacture, or composition of matter not known or used by others before the invention thereof by the applicant and not in public use or on sale for more than one year previous to the application in Canada, with the consent or allowance of the inventor.

An inventor who has patented his invention in a foreign country may obtain a patent in Canada if he applies within a year from the date of the issue of said patent. Notice to the Commissioner of intention of applying for patent, if given within three months from the date of the issue of foreign patent, entitles the inventor, after applying for and obtaining such patent, to prevent further manufacture of his invention by any person who may have commenced such manufacture during the year following the issue of the foreign patent and preceding the application for the Canadian patent.

In all cases the Canadian patent expires at the earliest date on which any foreign patent expires.

INVENTIONS EXCLUDED FROM PROTECTION.

All inventions having an illicit object in view or consisting in any mere scientific principle or abstract theorem.

NATURE AND DURATION OF THE PATENT—TAXES.

Patents are granted for eighteen years; but it is optional with applicant whether he shall pay for the whole term or only for six or twelve years, with permission to renew.

Fees:

Full fee for eighteen years	$20
Partial fee for twelve years	40
Partial fee for six years	20
Fee for further term of twelve years	40
Fee for further term of six years	20
Lodging a caveat	5

APPLICATION—FORMALITIES AND DOCUMENTS.

The application must be accompanied by an oath or affirmation to the effect that the applicant believes himself to be the original inventor. If applicant is a foreigner, he must elect domicile at some place in Canada.

There must also be given title of invention, specification in duplicate, (specification shall correctly and fully describe mode of operation and clearly state features claimed, shall bear the name of the place where made, and be signed by inventor or legal representative and two witnesses,) when necessary, drawings, in duplicate, in black ink, on tracing-linen eight by thirteen inches, signed by applicant or attorney; also, extra drawing on bristol-board, same size, but not necessarily giving all the figures, only the one giving the best general idea of the invention; no writing on the face, no title, certificate, or signature, but on the back of the sheets the inventor's name and title of invention in pencil. Oath may be made before any person authorized to administer oaths in the locality where it is made.

THE GRANT—WORKING.

Preliminary examination with reference to the formalities of the application and novelty and patentability of the invention.

The invention must be worked in Canada within two years from the date of the patent. Articles may be imported for one year only, unless extension of privilege is asked for. Such extension is limited to one year.

DENMARK.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of April 13, 1894. 68 O. G., 928.]

WHO MAY OBTAIN A PATENT.

The patent can be obtained only by the inventor or his assignee. In case of more than one application the preference is given to the first applicant.

Every applicant for a patent not a resident of Denmark must appoint a resident representative.

PATENTABLE INVENTIONS.

Inventions capable of being utilized in industry or capable of industrial exploitation.

INVENTIONS EXCLUDED FROM PROTECTION.

First, inventions devoid, as such, of any importance; second, those whose exploitation would be contrary to the laws, to morals, or to public order; third, inventions which at the time of the application were already described in a printed publication in any country or had already been used in public in Denmark sufficiently to be capable of being carried out by an expert in the art; fourth, inventions relating to medicines, food compounds, and beverages and those bearing on processes for manufacturing food.

NATURE AND DURATION OF THE PATENT—TAXES.

Three kinds of patents:

First. Patents of invention. Duration, fifteen years, dating from the date of issue.

Second. "Dependent patents," for improvements made on inventions patented by a person other than the applicant. Same duration.

Third. "Patents of addition," expiring with the principal patent.

Tax for filing, 20 crowns. Fee for issuing the patent, 10 crowns.

Amount of annual taxes:	*Crowns.*
The first three, each	25
The following three, each	50
The following three, each	100
The following three, each	200
The last three, each	300

"Patents of addition" pay only the filing fee.

Crown=$0.268.

APPLICATION—FORMALITIES AND DOCUMENTS.

First. Application for a patent, addressed to the Patent Commission, at Copenhagen, in duplicate.

Second. A description of the invention, in duplicate.

Third. When it is necessary for understanding the description, a drawing, in duplicate, and, according to circumstances, a model, sample, etc.

Fourth. When the applicant is not a resident of Denmark, the appointment of a general representative residing in that country, accompanied by the acceptance of the representative.

The application, on stamped paper, must indicate the name, profession, and the residence of the applicant, as well as the title of the invention. It must indicate the name of the inventor, and, if it is filed by another, contain proof of the assignment.

The description must be sufficiently complete to permit the invention to be carried out. It must indicate exactly what constitutes the invention (claims).

The application and the description must be on paper of official size.

One of the copies of the drawing must be on white cardboard of thirty-three centimeters in height by twenty-one, forty-two, or sixty-three in width. All the figures and writings of the drawing must be executed in india-ink, in very black and clear lines, without colors, within a line traced at two centimeters from the edge, a clear space of three centimeters being left at the top. The signatures must be placed in the lower right-hand corner. The second copy must be a tracing on muslin.

All documents must be in Danish.

MODELS.

Models are not required except when necessary for understanding the invention.

THE GRANT.

Preliminary examination as to formalities prescribed and as to the patentability of the invention.

Publication of the application, with call for opposition. Time allowed for opposition, eight weeks.

In case of rejection the applicant may appeal to the Patent Commission itself, afterward to a special commission to be appointed by the Minister of the Interior.

WORKING.

Patented invention must be worked in Denmark within three years from date of patent and must not be discontinued for more than one year.

FRANCE.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of July 5, 1844. 2 O. G., 565; 4 O. G., 343.]

WHO MAY OBTAIN A PATENT.

Any person who makes application therefor may obtain a patent for any new discovery or invention in any class of industry.

PATENTABLE INVENTIONS.

The invention of new industrial products.
The invention of new means or the new application of known means for obtaining an industrial result or product.
No discovery, invention, or application which in France or abroad and previous to the date of the filing of the application has received sufficient publicity to enable it to be carried out will be considered new, except in case of applications made in compliance with the terms of the International Convention.

INVENTIONS EXCLUDED FROM PROTECTION.

First. Pharmaceutical compositions or remedies of all kinds.
Second. Plans and combinations of credit or finance.

NATURE AND DURATION OF THE PATENT—TAXES.

First. Patents of invention. Duration, five, ten, or fifteen years, to start from the filing of the application.
Second. Certificates of addition. Same duration as that of the principal patent to which they refer.
The duration of patents granted for inventions already patented abroad cannot exceed that of such patents granted abroad.
Taxes: First, patents of invention, 100 francs a year; second, certificates of addition, single tax of 20 francs.
Franc=$0.193.

APPLICATION—FORMALITIES AND DOCUMENTS.

The applicant for the patent must file, under seal, at the office of the secretary of the prefecture in the Department in which he resides, or in any other Department which he elects as domicile—
First, his application to the Minister of Commerce, Industry, Posts, and Telegraphs;
Second, a description of the discovery or invention;
Third, the drawings or samples necessary for understanding the description;
Fourth, a memorandum of the documents filed.
The application must be limited to a single principal subject, including the details which it comprises and the uses to which it may be applied. It must mention the duration assigned to the patent and indicate a title, closing with a summary and precise designation of the subject of the invention. The description must be written in French. The denomination of weights and measures must be in the decimal system.
The drawings must be line drawings, in good black ink, according to the metric scale. They need not be signed.
A duplicate of the description and the drawings must be joined to the application.
All the documents must be signed by the applicant or his representative, whose power of attorney must accompany the application.
The application will be received only on the production of a receipt for the payment of the first annuity of 100 francs, at Paris, at the office of the Central Receiver of Finances of the Seine or in the Departments at the office of the receivers of finances.
A certificate of the filing is sent to the applicant on receipt of the price of the stamp.

MODELS.

The applicant may file a model if he thinks it necessary to the understanding of the invention.

THE GRANT.

When the application has been regularly prepared, the patent is issued, without preliminary examination, at the risk and peril of the applicant, and without guarantee either of the reality, the novelty, or the merit of the invention or of the fidelity or exactness of the description.

WORKING.

Patented invention must be worked in France within two years from grant of patent and must not be discontinued for more than two years.

GERMANY.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)

[Patent law of April 7, 1891. 55 O. G., 1697. Law for models of utility (*Gebrauchsmuster*) of June 1, 1891. 57 O. G., 414.]

WHO MAY OBTAIN A PATENT.

The patent is granted to the inventor or his assignee.
Persons not residing in Germany must appoint a resident representative.

Models of Utility, (Gebrauchsmuster.)

The model of utility is registered for the benefit of the first applicant.
A person having neither residence nor establishment in Germany can claim legal protection only when it has been published in the *Reichs-Gesetzblatt* that German models of utility enjoy legal protection in the country where he has his domicile or establishment. In depositing his model such person must appoint a representative in Germany.

PATENTABLE INVENTIONS.

New inventions that are susceptible of industrial use.
An invention which at the time of filing of the application has already been described in printed publications anywhere within the last century or which has already been used in the country in a sufficiently public manner for those skilled in the art to be able to work it will not be considered new.

Models of Utility. (Gebrauchsmuster.)

The law protects as models of utility working tools or inventions designed for practical use, or their parts, in so far as by a new configuration, a new arrangement, or a new mechanism they may serve for work or practical use.
Models will not be considered new which at the time of the application were already described in printed publications or had already been notoriously utilized in the country.

INVENTIONS EXCLUDED FROM PROTECTION.

First. Inventions the use of which would be contrary to the laws or to good morals.
Second. Inventions of food products, objects of consumption, (*Genussmittel,*) and medicines, as well as materials obtained by chemical means, in so far as these inventions do not relate to the process of manufacture.

NATURE AND DURATION OF THE PATENT—TAXES.

Two kinds of patents:
First. Patents of invention. Duration, fifteen years, to start from the day following the date of filing the application.
Second. "Patents of addition." Granted for the remainder of the term of the principal patent. May become in effect a principal patent if the principal patent for any cause becomes void.
Application fee, 30 marks; first annuity, 30 marks; second annuity, 50 marks; third annuity, 100 marks, and so on, with an annual increase of 50 marks.
"Patents of addition" pay only the filing fee and first annuity.

Models of Utility, (Gebrauchsmuster.)

The applicant receives a certificate of registry.
The duration of the protection is three years, to start from the date following the date of filing, and may be extended three years more.
Filing fee, for the first three years, 15 marks. Fee for extension, for the following three years, 60 marks.
Mark=$0.238.

APPLICATION—FORMALITIES AND DOCUMENTS.

First. Application for a patent, addressed to the Imperial Patent Office.
Second. Description of the invention, in duplicate, written on paper thirty-three by twenty-one centimeters.
Third. (*a*) A drawing (or several) on bristol or card board, drawn in indie-ink, without color or wash; (*b*) a tracing on muslin of the above drawing, which may be colored. Dimensions of the drawings of the two kinds: Thirty-three centimeters high by twenty-one wide, or thirty-three centimeters high by forty-two wide, or thirty-three centimeters high by sixty-three wide. A single line traced two centimeters from the edge must surround the drawings. Within this line, at the top, a space of three centimeters in height must remain free. The lower right-hand corner must receive the signature of the applicant or his representative.
Fourth. A power of attorney, not authenticated, if the application is filed by representative.

Models of Utility, (Gebrauchsmuster.)

First. A declaration addressed to the Imperial Patent Office containing—
(*a*) An application for registry;
(*b*) The title under which the model is to be registered;
(*c*) A statement of the new configuration or new mechanism to be protected;
(*d*) The declaration that the fee of 15 marks has been paid to the treasury of the Patent Office or that it will arrive at the same time with the declaration;
(*e*) The name, profession, and residence of the applicant, if the filing is done by representative;
(*f*) The list of the annexes;
(*g*) The signature of the person effecting the filing, with statement of his profession and residence.
Second. A picture or reproduction of the model. The picture (drawing, photograph, etc.) must be on bristol or card board thirty-three by twenty-one centimeters or on tracing-muslin not over thirty-three centimeters each way. The reproduction must not exceed fifty centimeters in each dimension.
Third. A power of attorney if the filing is effected by a representative.
All the documents mentioned under 1 and 2 should be filed in duplicate, except in case of filing a reproduction of the model, where it will suffice that it shall be accompanied by a picture of the latter. They must all bear the designation given to the model, (see 1, *b*,) the name and residence of the applicant, and the date of filing.
All the written documents must be drawn up on sheets of paper thirty-three by twenty-one centimeters.

MODELS.

The Patent Office may require the filing of models of the objects to be patented whenever it is considered necessary.
When it is a question of applications for patents relating to processes for the manufacture of chemical products, there must be filed a sample of the products in question, as well as the intermediate products necessary for the application of these processes. If the invention relates to colors derived from tar, there must likewise be filed samples of wool, silk, or cotton dyed in these colors.

THE GRANT.

First. Preliminary examination relating to the formalities of the application and the patentability and novelty of the invention.
Second. Publication of the application, with call for opposition: Time allowed for opposition, two months. In case of rejection of application or in case of allowance of a contested application the interested party may appeal, within a term of one month, to the Patent Office, Division of Appeals.

Models of Utility, (Gebrauchsmuster.)

Registry is accorded without examination on compliance with the legal formalities.

WORKING.

Patented invention must be worked within three years after publication of grant of patent. Patentee may be compelled to grant licenses to others.

GREAT BRITAIN.

(MEMBER OF THE INTERNATIONAL UNION.)

[Statute of 1623 of monopolies; laws of August 25, 1883, August 14, 1885, June 23, 1888, and December 24, 1888. 25 O. G., 97; 28 O. G. 1127; 46 O. G., 1265.]

WHO MAY OBTAIN A PATENT.

The patent is valid only when granted to the true and first inventor either alone or jointly with another or others.
A person resident in the United Kingdom to whom an invention has been communicated from abroad is considered a first and true inventor.
In case of decease of the inventor the patent is granted to his legal representative.

PATENTABLE INVENTIONS.

Any manner of new manufactures, provided they are not in use or publicly known at the time of the grant of the patent and are not contrary to the law nor mischievous to the State by raising the price of commodities in the United Kingdom or injuring trade or generally inconvenient. (Statute of 1623.)

NATURE AND DURATION OF THE PATENT—TAXES.

Only one kind of patent is issued, having a duration of fourteen years from the date of filing the application.
Taxes: At the filing of the application for provisional protection, 1 pound; at the subsequent filing of the complete specification, 3 pounds; at the filing of the complete specification with the first application, 4 pounds, (the payment of these filing fees secures the legal protection during the first four years of the patent;) fifth year, 5 pounds; sixth year, 6 pounds, and so on, increasing by 1 pound a year.
Pound=$4.866⅔.

APPLICATION—FORMALITIES AND DOCUMENTS.

The application, addressed to the Patent Office, must declare that the applicant is in possession of an invention of which he is the true and first inventor. It must be accompanied by a specification, either provisional or complete.
The provisional specification must describe the nature of the invention.
The complete specification must describe and explain in detail the nature of the invention and the manner in which it must be carried out and be accompanied by drawings, if necessary.
The specification (provisional or complete) must begin with the title. The complete specification must end with a precise indication of the invention claimed.
If the application is accompanied by a provisional specification, the applicant may file the complete specification within the nine months following.
If agents represent applicants, they must be duly appointed by the applicant.
Every application that is to enjoy the time allowance of priority established by Article 4 of the International Convention or a similar arrangement of a convention concluded between Great Britain and a foreign State, must contain a declaration proving the filing of the anterior application made abroad and specify the foreign States in which applications have been made for patents for the same invention, as well as the official dates of these applications. The application must be made by the person who made the foreign application within seven months following the first foreign application.
There must also be furnished a certified copy of the specification filed by the applicant in the Patent Office of the foreign State, together with a statutory declaration affirming the identity of the invention with the invention in reference to which the first foreign application was made. If the foreign specification be in a foreign language a translation must be annexed and certified to in conformity with the original.
The applications and specifications mentioned above must be drawn up on blanks that may be procured at the principal post-offices of the United Kingdom.

MODELS.

The Department of Science and Arts may at any time require the patentee to furnish a model of his invention on payment of the expenses of the manufacture of the model.

THE GRANT.

First. Examination of the complete specification to see that it has been prepared in the manner prescribed and if the invention described in detail is the same as that described in the provisional specification.
Second. Publication of the acceptance of the complete specification, when the application is open for two months to the public for opposition by interested parties.
The patent is issued if unopposed or in event of an unsuccessful opposition.

WORKING.

Any interested party can oblige the inventor to grant him a license on such terms as the Board of Trade may determine.

HUNGARY.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)*

[Law of July 14, 1895.]

WHO MAY OBTAIN A PATENT.

The patent belongs to the inventor or to the holder of his interest.
Persons not living in Hungary must appoint a representative in the country.

PATENTABLE INVENTIONS.

Every invention that is new and susceptible of being used industrially.
An invention is not considered new if at the time of the application for the patent—
First, it has already been sufficiently described by publication in a journal printed or otherwise reproduced to admit of its use by those skilled in the art;
Second, it has already been sufficiently divulged by exploitation or public exhibition to enable those skilled in the art to carry it into effect;
Third, it has already been the object of a patent.
The invention is considered as new, though it shall have been used or published, if one hundred years shall have elapsed since the last case of exploitation or publication.

INVENTIONS EXCLUDED FROM PROTECTION.

Inventions, first, the application of which is contrary to law and good morals; second, relating to objects necessary for the development of the power of the army or the navy, if the Minister of Commerce opposes the granting of the patent; third, bearing upon theories and scientific principles, as such; fourth, for food products and medicines and chemical compounds; (the process for the manufacture of these products is, however, patentable.)

NATURE AND DURATION OF THE PATENT—TAXES.

Two kinds of patents:
First. Patents of invention. Duration, fifteen years, to start from the filing of the application.
Second. "Patents of addition." Same duration as the principal patent to which they refer. May become in effect a principal patent if the principal patent becomes void for any reason.
Third. "Patents of improvement," granted for term of fifteen years to owner of original patent only during the first year after the grant of the original patent and thereafter to any one whether such owner or not.
Fee for filing for the two kinds of patents, 20 crowns.
Annual tax for the patents of invention:

	Crowns.
First year	40
Second year	50
Third year	60
Fourth year	80
Fifth year	100
Sixth year	120
Seventh year	140
Eighth year	160
Ninth year	200
Tenth year	250
Eleventh year	300
Twelfth year	350
Thirteenth year	400
Fourteenth year	500
Fifteenth year	600

Single tax for "patents of addition," 40 crowns over and above the fee for filing.
Crown=$0.203.

APPLICATION—FORMALITIES AND DOCUMENTS.

The application for the patent must be filed in writing in the Patent Office and must contain—
First, the name, profession, and residence of the applicant and, if the case calls for it, of his representative;
Second, the title of the invention;
Third, the declaration that the petitioner is the inventor or the holder of his interest, and in the latter case—
Fourth, the name, the profession, or the residence of the inventor, as well as a reference to the document upon which the applicant founds his right.
To the application must be joined—
First, the receipt of the Treasury for the payment of the fee for filing;
Second, a legalized power of attorney if the filing is done by a representative;
Third, the description of the invention, in duplicate, in a closed envelop, upon which should be written the title of the invention, as also the name and residence of the applicant;
Fourth, when the applicant is the holder of the interest of the inventor, the document showing the transfer of the invention.
The description must be sufficiently clear to enable those skilled in the art to understand the invention without other aid. It must end with one or more claims showing what is new and to be protected. If there are several claims and the substance of the invention consists in their combination or in their grouping, this circumstance must be mentioned. The description must be accompanied by the drawings necessary for the understanding of the invention and be accompanied, if necessary, by samples or models. It must be signed by the applicant or his representative. The requirements as to drawings are the same as for Germany.

MODELS.

The filing of samples or of models is obligatory if necessary for the understanding of the invention.

*See note under Austria.

THE GRANT.

First. Examination of the application for the patent in reference to regularity and the patentability of the invention, except in relation to the novelty of the latter.

Second. Publication of the invention, with call for opposition. Time allowed for opposition, two months.

In case of the refusal of a patent or in case of acceptance of an application for a patent contested the injured party can appeal it, within thirty days, to the judiciary branch of the Patent Office.

WORKING.

Patented invention must be worked in Hungary within three years from the publication of the grant.

ITALY.

(MEMBER OF THE INTERNATIONAL UNION.)

[Laws of October 30, 1859, and January 31, 1864.]

WHO MAY OBTAIN A PATENT.

The right to the patent is accorded to the author of a new industrial invention or discovery or his assignee.

PATENTABLE INVENTIONS.

Any new industrial invention.

An invention is called "industrial" when it has directly for its object, first, an industrial product or result; second, an instrument, a machine, a tool, a mechanism, or any mechanical construction whatsoever; third, a process or method of industrial production; fourth, a motor or the industrial application of a force already known; fifth, the technical application of a scientific principle, provided it gives immediate industrial results.

An invention is not considered new when it has been previously known in Italy or has been published in Italy or elsewhere.

Description in a printed publication due to requirement of foreign patent law does not invalidate a patent of importation.

INVENTIONS EXCLUDED FROM PROTECTION.

First. Inventions relating to industries contrary to law, to morality, and to public safety.

Second. Inventions which have not for their aim the production of material objects.

Third. Inventions or discoveries purely theoretical.

Fourth. Medicines.

NATURE AND DURATION OF THE PATENT—TAXES.

Three kinds of patents:

First. Patents of invention. Duration, one to fifteen years, as elected by the applicant, reckoning from the last day of March, June, September, or December next following the date of application. Patents granted for a less term than fifteen years may be prolonged to the full term.

Second. "Patents of importation," for new inventions already patented abroad. The same duration as the foreign patent conceded for the longest term, without, however, exceeding the term of fifteen years.

Third. "Patents of improvement."

Fourth. "Patents of addition." The same duration as the principal patent to which they refer.

Taxes: First, patents of invention and importation, 40 lire for the first three years, besides 10 lire per year indicated in the application for the patent; 65 lire for each of the years four to six; 90 lire for each of the years seven to nine; 115 lire for each of the years ten to twelve; 140 lire for each of the last three years; second, "patents of addition," single tax of 20 lire. There is also a "prolongation tax" of 40 lire, payable in addition to the annuities and proportional tax when it is desired to prolong the term of a patent originally taken for less than fifteen years.

Lira=$0.193.

APPLICATION—FORMALITIES AND DOCUMENTS.

The application for a patent must be addressed to the Minister of Agriculture, Industry, and Commerce through the local prefecture or subprefecture. It must contain—

First, the surname and Christian name, the country, and the residence of the applicant and of his representative, if the case calls for it;

Second, the title of the invention;

Third, a statement of the duration desired for the patent.

To the application must be joined—

First, the description of the invention;

Second, the drawings, when possible, and the models which may be considered necessary for the understanding of the invention;

Third, the receipt for the payment of the prescribed taxes and stamp fees;

Fourth, the original title or certified copy of the patent granted to the foreigner, when a patent of importation;

Fifth, if the application is filed by a representative, the power of attorney in authentic form, or in unauthenticated form with the signature of the applicant certified to by a notary or by the magistrate (syndic) of the commune where the said applicant resides;

Sixth, a list of the documents and articles filed.

The description must be written in Italian or French and must contain a complete and detailed statement of all the particulars necessary to enable one skilled in the art to put the invention into practice.

Three copies of the description and the drawings, signed by the applicant, must be filed.

If a model is filed, it will be sufficient to file two copies of the drawings.

The application and the three copies of the description must be written on paper stamped with 50 centimes. The description must be headed "Description of the invention having for title," etc.

The drawings must be furnished in triplicate, one being on bristol-board, in good black ink, for photographic reproduction, and two copies on tracing-cloth. There are no fixed dimensions for the sheet. It is only essential that the figures shall not exceed forty centimeters in any direction. Each sheet must have a fifty-centime stamp.

MODELS.

Models need be filed only when the inventor considers it necessary for the understanding of the invention. In this case each model must be furnished with a tag of cardboard or wood, on which shall be placed the signature of the party receiving the deposit and that of the one making it.

THE GRANT.

The patent is granted without preliminary examination as to the novelty of the invention.

The administration refuses the patent only if the application bears upon an invention in a class declared not patentable by law or if the filing has not been regularly effected. In case of refusal the applicant may within fifteen days address a complaint to a special commission named each year by the Minister.

Patents relating to beverages or foods are not granted except upon the favorable judgment of the Superior Council of Health.

WORKING.

If the patent is granted for five years or less, the invention must be worked in Italy within one year from the date of the patent, and working must not be omitted for more than one year. If the patent is granted for more than five years, the invention must be worked within two years, and working must not be omitted for more than two years.

JAPAN.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)

[Law of 1888. Treaty with United States November 22, 1894.]

WHO MAY OBTAIN A PATENT.

The inventor only may apply for a patent. In case a person who has applied for or obtained a patent dies his rights devolve on his heirs or assigns.

In case of interfering applications the patent is granted to the prior inventor. When in case of interference between an application and a patent priority is awarded to the applicant and the existing patent is revoked, the patent granted to the applicant dates from the date of the revoked patent and has the same term.

Applicants residing abroad must appoint a representative residing in Japan.

PATENTABLE INVENTIONS.

Any new and useful technical process, machine, manufacture, or compound, or any new and useful improvement thereof.

Inventions publicly known or publicly used before application for patent is made are not considered new.

Inventions from which no good result can be expected are not considered patentable.

When the general use of an invention is considered desirable for the public interest or it is considered desirable that the invention be kept secret for military purposes, the Minister of State for Agriculture and Commerce may grant a conditional patent, or refuse to grant a patent, or may fix conditions to or cancel a patent already granted. In such case he must give the inventor or owner of the patent adequate compensation.

An improvement on a patented invention can be patented only after a license to use the original invention with the improvement has been obtained from the owner of the patent either by agreement or, in certain cases, by direction of the Minister of State for Agriculture and Commerce on payment of adequate compensation.

INVENTIONS EXCLUDED FROM PROTECTION.

First. Articles of food, drink, or fashion.

Second. Medicines or methods of compounding them.

Third. Articles which have been in public use before the application for a patent. This does not exclude articles which have been on public trial not more than two years.

NATURE AND DURATION OF THE PATENT—TAXES.

Patents are granted for terms of five, ten, or fifteen years, as the applicant may elect. Term is reckoned from day of registration.

A patent which is lost or damaged may be reissued on payment of a fee of 1 yen.

A patent of which the drawing or specification is insufficient may be amended provided the essential features of the invention are not changed.

Fees: For application of patent, 5 yen; for the grant of Letters Patent for five years, 20 yen; for ten years, 30 yen; for fifteen years, 40 yen. For amended Letters Patent: for a patent for five years, 10 yen; for ten years, 15 yen; for fifteen years, 20 yen.

Yen=$1.00.

APPLICATION—FORMALITIES AND DOCUMENTS.

Application addressed to the Minister of State for Agriculture and Commerce stating the name, status, occupation, domicile, and present residence of the applicant, the title of the invention, the date at which the invention was made, and the term for which a patent is desired, signed and sealed by the applicant, together with the specification and necessary drawings, must be

filed at the Patent Bureau. Registration-stamps of a value corresponding to the required fee must be affixed.

A foreigner making application for patent must furnish a certificate of nationality. All documents must be written in Japanese. A power of attorney, certificate of nationality, or other document written in a foreign language must be accompanied by a translation.

The specification must be clearly written without erasure or alteration on Mino paper, thirteen lines per page and twenty-five characters per line. It must comprise—

First, title sufficiently indicating the nature of the invention;

Second, brief statement of the nature and purpose of the invention;

Third, brief explanation of the drawings, if any;

Fourth, detailed explanation of the invention, referring to the drawings, if any, sufficiently clear to enable any person of ordinary ability to work the invention without difficulty, the meaning of words used in the claims being explained;

Fifth, in case of an improvement the difference between the original invention and the improvement must be pointed out;

Sixth, claims in which the essential features of the invention shall be pointed out.

Drawings must be in black india-ink and must be suitable for reproduction by photolithography. Space occupied by figures, 7.2 by 4.6 suns. (Sun=1.19 inch.) Margin at top, 1 sun; at bottom, .8 sun; at left, .3 sun; at right, 1.5 sun. On the drawing shall be put only the name of the applicant and his agent, with the seal of the latter. Not more than one sheet shall be used unless necessary. As little shading shall be used as possible. Section shall be shown by parallel lines about .3 sun apart. Four copies of drawings are required, which must be on Mino paper.

MODELS.

Models or specimens, when required, must be filed within ninety days from the date of notice that they are required.

THE GRANT.

Preliminary examination as to formalities and as to novelty and patentability. In case of rejection reëxamination may be demanded. Any person dissatisfied with the reëxamination may appeal to the Director of the Patent Bureau, who hears the case with two or more assistants. Costs in appeals are assessed as in civil suits.

WORKING.

Patented inventions must be worked within three years from the date of the patent, and working must not be discontinued for more than three years.

MEXICO.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)

[Law of June 7, 1890. 57 O. G., 412.]

WHO MAY OBTAIN A PATENT.

The patent is granted to the inventor only, or, if already patented abroad, to the applicant for the foreign patent or his assignee. Persons not residing in Mexico must appoint a resident representative. Patentee has the exclusive right for one year after the grant to patent improvements.

PATENTABLE INVENTIONS.

A patent may be obtained on a new industrial product, a new method of production, or a new application of means already known to obtaining a result or an article useful in industry. Chemical or pharmaceutical preparations are likewise patentable. Inventions are not new if given such publicity in Mexico or abroad as to enable them to be worked; but this does not include publication by foreign patent office.

INVENTIONS EXCLUDED FROM PROTECTION.

First. Inventions of which the operation is forbidden by law or imperils the lives and property of citizens.

Second. Scientific principles or discoveries of a purely speculative order and not taking any tangible shape.

NATURE AND DURATION OF THE PATENT—TAXES.

Patents are granted for twenty years, dating from the date of the grant. The term may be extended for five years at the discretion of the executive. Patents granted for inventions previously patented abroad expire at the same time with the foreign patent, or, if more than one, with the foreign patent first granted.

The taxes are, before the expiration of the fifth year, $50 (Mexican); before the expiration of the tenth year, $75; before the expiration of the fifteenth year, $100.

APPLICATION—FORMALITIES AND DOCUMENTS.

Application in due form must be made to the Department of Public Works and must include petition, duplicate specification, (in Spanish,) and duplicate drawings on cloth or paper of any convenient size, with margin at the sides.

A non-resident who is unable to appear personally must appoint a resident agent by notarial power, legalised by Mexican consul.

MODELS.

Models are not usually required.

THE GRANT.

Patents are granted without preliminary examination; but notice of application must be published three times in the *Official Journal*, with call for opposition. Time allowed for opposition, two months.

WORKING.

Patented inventions must be worked within five years from the date of the patent.

NORWAY.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of June 16, 1885. 33 O. G., 500.]

WHO MAY OBTAIN A PATENT.

The patent is valid only when granted to the first inventor or to his assignee.

Persons not living in Norway must appoint a representative in that country.

PATENTABLE INVENTIONS.

New inventions which may be utilized in the arts.

An invention is not considered new if before the filing of the application for the patent it is already sufficiently well known to be used by persons skilled in the art. The publication in a printed memoir or the exhibition at an international exposition, however, constitutes an obstacle to the granting of the patent only after the expiration of six months.

INVENTIONS EXCLUDED FROM PROTECTION.

First, inventions the use of which is contrary to law, to good morals, or to public order; second, those the object of which is a food, an article of consumption, or a medicine. Patents, however, can be granted for the processes or the special apparatus designed for the manufacture of such products.

NATURE AND DURATION OF THE PATENT—TAXES.

Two kinds of patents:

First. Patents of invention. Duration, fifteen years, to start from the filing of the application.

Second. "Patents of addition." Same duration as the principal patent to which they refer.

Fee for filing, 20 crowns, (this constitutes at the same time the first annuity for the patents of invention;) second annuity, 10 crowns; third annuity, 15 crowns, and so on, with an annual increase of 5 crowns.

"Patents of addition" are subject to the payment of the filing fee only.

Crown=$0.268.

APPLICATION—FORMALITIES AND DOCUMENTS.

The applicant must file with the Commissioner of Patents—

First, an application for a patent addressed to the Commissioner;

Second, the description of the invention, in duplicate;

Third, the drawings necessary for explaining the invention, also in duplicate, and, if the case requires it, models, specimens, etc.;

Fourth, a power of attorney if the application is not filed by the inventor himself;

Fifth, a memorandum of the documents filed.

The application must state the name of the applicant, with his profession and residence, as well as the title of the invention. If the invention is not made by the applicant, he must furnish documents proving the transfer of the invention.

The description must be sufficiently clear and complete to enable an expert in the art to execute the invention. It must end with an exact indication of what the applicant claims as his invention.

The application and the description must be written in Norwegian.

The drawings must be executed in a sufficiently clear and durable manner. They must reproduce all the details named in the description, which must be indicated by letters or figures corresponding in the text and drawings. The requirements for drawings are the same as for Germany.

MODELS.

Models need not be filed unless necessary for the understanding of the invention.

THE GRANT.

First. Preliminary examination bearing upon the formality of the application.

Second. Publication of the application, with call for opposition. Time allowed for opposition, eight weeks.

Third. Examination bearing on the patentability of the invention.

In case of the refusal of a patent the applicant can within six weeks demand of the Commission to submit the matter to a new examination, furnishing it with explanations of a nature to bring about another result.

If the decision does not give satisfaction to the applicant, he may within four weeks demand that the matter be submitted to examination by a superior commission composed of seven members named by the King for each special case.

WORKING.

The patented invention must be worked in Norway within three years from the date of the grant of the patent and working must not be discontinued more than one year.

PORTUGAL.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of May 21, 1896.]

WHO MAY OBTAIN A PATENT.

A patent can be granted to any person who has invented an industrial object or a material product of commerce, (Art. 6.)

The right to receive the patent belongs to the first applicant, (Art. 27.)

PATENTABLE INVENTIONS.

The following can be patented:
First. A new product or new industrial result.
Second. A new combination or arrangement of parts or elements which may be new or already known.
Third. A new principle or means of industrial or professional application.
Fourth. A new application of known means.
Fifth. A new application of known products.
Sixth. A technical application of known scientific principles.
Seventh. An improvement in any product or industrial object whatsoever.
Eighth. A new method or process of industrial production.
Ninth. A means of rendering the production more economical, of regulating or facilitating it.
In chemical industries and in pharmacy patents are granted only for processes and not for the products themselves.
No invention is considered as new which has been described in any publication whatsoever within less than one hundred years or which has been utilized in a public manner in Portugal or in Portuguese possessions.

INVENTIONS EXCLUDED FROM PROTECTION.

Chemical and pharmaceutical products. The processes for the manufacture of these products are patentable.

NATURE AND DURATION OF THE PATENT—TAXES.

First. Patents of invention. Duration not to exceed fifteen years, to start from the date of the patent.
Second. Certificates of addition. The same duration as the principal patent to which they refer.
Taxes: First, patents of invention, 3,000 reis per year; second, certificates of addition, single tax of 3,000 reis.
Milreis=$1.08.

APPLICATION—FORMALITIES AND DOCUMENTS.

The applicant for a patent must address to the Division of Industry, at the Ministry of Public Works, Commerce, and Industry—
First, a petition in Portuguese or French containing the name and residence and nationality of the petitioner, the short title of the patent, the claims showing what it contains that is new, and the term for which the patent is desired;
Second, a power of attorney in favor of a person living in Portugal, if the case requires it;
Third, a list, in duplicate, of the documents accompanying the petition;
Fourth, a description of the invention, accompanied by the drawings necessary for the understanding of this description.
These documents must be filed in duplicate, sealed.
All the documents written or drawn must be dated and signed.
There may also be filed models or samples of invented objects. Those which cannot be signed must bear the private seal of the petitioner.
The description of the invention and the titles may be written in Portuguese or French.
At the time that the application for the patent is filed there must be deposited in the Division of Industry—
First, the sum of 3,000 reis for each of the years asked for in the application for the patent;
Second, the sum of 500 reis per page of twenty-five lines when written in the French language, and of 200 reis for the expense of correspondence. It is not necessary to translate the explanatory words on the drawings.
The description must be written with non-copying black ink, or lithographed or printed, on paper thirty-three centimeters long by twenty-two centimeters wide, and must be sufficiently clear to enable any competent person to execute the invention. It must be dated and signed by the inventor or by his representative and initiated on each sheet. It must have the short title of the patent applied for at the top of the first page and must end with the claims showing the points considered as new. These claims must correspond exactly with those indicated in the petition.
The drawings must be thirty-three centimeters long and of the necessary width. They must be inclosed in plain lines, with a margin of at least two centimeters. They may be done in india-ink and water-colors or in permanent black ink or be reproduced by lithography or photography. The scale must always be indicated. The parts representing the novelty should be made apparent by shading or hatching. Instead of drawings good photographs may be filed.
The inventor who wishes to enjoy the time allowance of priority established by the International Convention of March 20, 1883, must file besides the documents named above a document proving the date which serves as the point of departure of this time allowance. He who desires to obtain a patent antedating the date of the foreign patent must file the patent granted in the country of origin or a legal copy of this patent.
The rules of practice of March 26, 1895, contain forms for the drawing up of the application for a patent and the list of documents filed.

MODELS.

The filing of models or specimens is optional.

THE GRANT.

First. Examination of the application for a patent with reference to prescribed formalities.
Second. Publication of the application, with call for opposition. Time allowed for opposition, three months.
In case of the refusal of a patent the interested party may appeal to the Tribunal of Commerce within three months.

WORKING.

Patented invention must be worked in Portugal within two years from the date of the patent and working must not be interrupted for two years.

RUSSIA.

(NOT A MEMBER OF THE INTERNATIONAL UNION.)
[Law of May 20 (June 1), 1896. 79 O. G., 2201.]

WHO MAY OBTAIN A PATENT.

The right to the patent belongs to the inventor or to his assignee. The patent is granted to the first applicant.
If the petitioner be living abroad, he must appoint a representative living in Russia.

PATENTABLE INVENTIONS.

Inventions which present an element essentially new, either in whole or in one or several of their parts or in the original combination of their parts when they are already known separately.

INVENTIONS EXCLUDED FROM PROTECTION.

The inventions, first, which represent scientific discoveries and abstract theories; second, which are contrary to public order, to morality, and to good manners; third, which previous to the application for the patent have been patented in Russia or have been used there without a patent or which have been described in print in a manner sufficiently complete to be reproduced; fourth, which are known abroad without a patent or which are there patented in the name of a person other than the petitioner, except in case the invention shall have been assigned to the latter; fifth, which do not represent a sufficient novelty, but constitute trifling modifications of inventions already known.
Patents are not granted for chemical products, foods, and the like, for compounded medicines, though for the processes and apparatus designed for the manufacture of the latter patents may be obtained. In addition, patents are not at present granted for munitions of war unless adapted to other purposes, in which case the grant is subject to the right of the Government to use the same without compensation.

NATURE AND DURATION OF THE PATENT—TAXES.

Two kinds of patents:
First. Patents of invention. Duration, fifteen years, to start from the date of the signing of the patent.
Second. "Patents of addition." Expire with the principal patent to which they refer.
Taxes: First, patents of invention, fee for filing, 30 rubles; first year, 15 rubles; second year, 20 rubles; third year, 25 rubles; fourth year, 30 rubles; fifth year, 40 rubles; sixth year, 50 rubles; seventh year, 75 rubles; eighth year, 100 rubles; ninth year, 125 rubles; tenth year, 150 rubles; eleventh year, 200 rubles; twelfth year, 250 rubles; thirteenth year, 300 rubles; fourteenth year, 350 rubles; fifteenth year, 400 rubles; second, "patents of addition," single tax, 30 rubles.
A patent granted for an invention already patented abroad previous to the date of the filing of the application expires as soon as the patent or one of the foreign patents of anterior date has ceased to exist.
Ruble=$0.772.

APPLICATION—FORMALITIES AND DOCUMENTS.

First. Application for a patent addressed to the Department of Trade and Manufactures, with the heading "To the Committee of Technical Affairs." It must be written upon a sheet of paper of ordinary size, furnished with two stamps of 80 copecks and containing a request for the granting of a patent for the invention indicated in the description and the title of the invention, corresponding to the nature of the latter.
Second. A memorandum of the documents inclosed, the principal of which are the description, the explanatory drawings, the receipt for the fee for filing of 30 rubles, and, the case requiring it, the power of attorney in favor of the representative.
The application must be signed by the petitioner or by his representative, signing by power of attorney, which in the case of a foreign applicant must be legalized.
The description must be written in the Russian language and be clear and plain. It must be accompanied, if the case requires, by drawings and models sufficiently plain to enable one to reproduce the invention. At the end it must contain an enumeration of the distinctive particulars of the invention. The description must be written on paper of ordinary size, in duplicate, and be signed by the petitioner or his representative. A stamp of 80 copecks must be affixed to each sheet of one of the copies.
The drawings must be in black lines, on thick white drawing-paper. Their size must be thirteen inches long by eight inches in width, or thirteen inches by sixteen, or thirteen inches by twenty-four. Each drawing must be surrounded by a margin of about one inch. Upon the upper margin must be indicated the application to which the drawing relates. The addition of explanatory words and the use of colors are prohibited.
The drawings must be filed in duplicate, one of which must be on drawing-paper and one on tracing-cloth. The usual designation of the figures—*i. e.*, "Fig."—must not appear on the drawing.
The applications presented by the representative must be accompanied by a power of attorney. If the petitioner is living abroad and if the power of attorney is written in a foreign language, this power of attorney must bear the signature of the local Russian consul, certifying that it is executed according to the laws of the country, and be accompanied by a certified translation in the Russian language.
If the invention be already patented abroad, the application must be accompanied by a certified copy of that foreign patent which is the first to expire.

If the patent is asked for an invention patented abroad in the name of another person, the petitioner must file a certified assignment stating that he has received the exclusive right to use the invention in Russia.

MODELS.

The filing of models is required if it be necessary in order to easily reproduce the invention.

THE GRANT.

The applicant for a patent who has complied with the prescribed formalities receives a certificate of protection, which permits him to use his invention, to make it known, and to threaten infringers with prosecution. This certificate ceases to be in force if a patent is denied.
The application is submitted to the Committee of Technical Affairs of the Department of Commerce and Manufactures, which determines whether the application and the description of the invention answer to the conditions established by law. These researches do not bear either upon the utility of the invention or upon the existence of the right of the petitioner.
In case of refusal the interested party may appeal within the three months to the Department of Commerce and Manufactures.

WORKING.

Patented invention must be worked in Russia within five years from the grant of the patent.

SPAIN.

(MEMBER OF THE INTERNATIONAL UNION.)
[Law of July 30, 1878. 26 O. G., 108.]

WHO MAY OBTAIN A PATENT.

Any Spaniard or foreigner who desires to establish or has established a new industry in the Spanish dominions.

PATENTABLE INVENTIONS.

Machines, apparatus, instruments, mechanical or chemica processes or operations which as a whole or in part are of original invention and new or which, if not new, are not established or exploited in the same manner or under the same form in the Spanish dominions.
New industrial products or results obtained by new or known means, provided that their exploitation will result in establishing a new branch of industry in the country.
Inventions which are known or have been exploited in the Spanish domains or abroad are not considered new.

INVENTIONS EXCLUDED FROM PROTECTION.

First. The results or products of patentable machines, apparatus, instruments, mechanical or chemical processes or operations when they are not of original invention or new and their exploitation does not result in establishing a new branch of industry in the country.
Second. The use of natural products.
Third. Scientific principles or discoveries as long as they remain in the domain of speculation and are not reduced to a practical industrial use.
Fourth. Pharmaceutical preparations or medicines.
Fifth. Plans or combinations of credit or finance.

NATURE AND DURATION OF THE PATENT—TAXES.

Three kinds of patents:
First. Patents of invention for subjects of original and new invention. Duration, twenty years.
Second. Patents of introduction for all that is not of original invention or which, so being, is not new. Duration, five years.
Third. "Patents of importation" for all original inventions, even though the inventor has already obtained a patent for the same invention abroad, if he makes application in Spain before the expiration of a period of two years from the time of obtaining the first foreign patent. Duration, ten years.
Fourth. "Patents of addition." Expire with the principal patent to which they relate.
Tax: 10 pesetas the first year, 20 pesetas the second, and so on, increasing by 10 pesetas each year, payable in advance annually; "patents of addition," single tax of 25 pesetas.
Peseta=$0.193.

APPLICATION—FORMALITIES AND DOCUMENTS.

The applicant for a patent must file at the office of the civil government of any of the provinces of Spain the following documents and articles:
First. An application to the Ministry of Commerce stating the single subject of the patent, whether the said subject is or is not of original invention and new, and stating the address of the applicant or his representative. In the latter case the power of attorney must be joined to the application.
Second. A specification, in duplicate, describing clearly the invention to be patented. At the end of the specification there will be indicated in a note which part, mechanism, process, etc., it is desired to make the subject of the patent. The indications relative to weights and measures must be according to the metric system.
Third. The drawings, samples, or models that the applicant shall deem necessary for understanding the specification, in duplicate. The drawings must be executed in duplicate, on tracing-cloth, in ink, on a metric scale.
Fourth. The certificate of payment to the State of the tax for the first year.
Fifth. A signed list of all the documents and articles deposited, which must themselves also be signed by the applicant or his representative.
The specification must be written in the Spanish language, without abbreviations or corrections, on numbered sheets.

MODELS.

The applicant may file a model if he thinks it necessary for understanding the invention.

THE GRANT.

The patents are granted without preliminary examination as to the novelty or utility of the invention.

WORKING.

Patented invention must be worked in the Spanish dominions within two years from its date. Working must not be discontinued for more than one year.

SWEDEN.

(MEMBER OF THE INTERNATIONAL UNION.)
[Laws of May 16, 1884; June 12, 1891; April 14, 1898; March 26 and May 28, 1897.]

WHO MAY OBTAIN A PATENT.

The patent is valid only when granted to the inventor or to his assignee.
Persons not living in Sweden must appoint a representative in that country.

PATENTABLE INVENTIONS.

Inventions bearing upon new industrial products or upon special processes of manufacture.
An invention is not considered new if before the filing of the application for the patent the invention has been described in a manner sufficiently detailed in a public print or if it has been used in a manner plain enough to enable a person skilled in the art to practice the invention.
Exhibition of the invention at an international exposition does not, however, constitute an obstacle to the obtaining of a patent if the application be made within six months after the exhibition of the invention.

INVENTIONS EXCLUDED FROM PROTECTION.

Inventions the use of which is contrary to the laws or to good morals.
If an invention relates to foods or medicines, the patent cannot be granted for the product, but only for the processes of manufacturing the same.

NATURE AND DURATION OF THE PATENT—TAXES.

Two kinds of patents:
First. Patents of invention. Duration, fifteen years, to start from the filing of the application.
Second. "Patents of addition." Expire with the principal patent to which they refer.
Fee for filing, 20 crowns, (this constitutes at the same time the first annuity for the patents of invention;) annual tax for each of the years two to five, 25 crowns; for the years six to ten, 50 crowns; for the years eleven to fifteen, 75 crowns. A ten-crown stamp must be affixed to the Letters Patent.
The "patents of addition" are subject only to the payment of the fee for filing.
Crown=$0.268.

APPLICATION—FORMALITIES AND DOCUMENTS.

First. Application for a patent addressed to the Bureau of Patents and Registry.
Second. Description of the invention, in duplicate.
Third. The drawings necessary for the understanding of the description, in duplicate. The requirements for drawings are the same as for Germany.
Fourth. Models or samples, if the case requires.
Fifth. A power of attorney in favor of the representative if the applicant resides outside of the country.
The application should state the name, profession, and address of the applicant, as well as the title of the invention.
The description should be sufficiently clear to enable a person skilled in the art to use the invention. It should show in precise terms what the applicant considers as new in the invention.
If the patent is applied for by a person other than the inventor, the applicant should show that he is the holder of the interest of the former.
All the parts of the application must be in the Swedish language or if in another language must be accompanied by a legalized translation.

MODELS.

Models need not be filed unless necessary for the understanding of the invention.

THE GRANT.

First. Preliminary examination bearing upon the patentability of the invention.
Second. Publication of the application, with call for opposition. Time allowed for opposition, two months.
In case of the refusal of the patent the applicant can lodge an appeal with the King within the time allowance of sixty days.

WORKING.

Patented invention must be worked in Sweden within three years from the date of the patent; but the time may be extended on request to four years. Working must not be omitted for more than one year.

SWITZERLAND.

(MEMBER OF THE INTERNATIONAL UNION.)

[Laws of June 29, 1888, and March 13, 1893. 45 O. G., 233; 45 O. G., 1070; 49 O. G., 1046; 64 O. G., 1010.]

WHO MAY OBTAIN A PATENT.

The patent is valid only when granted to the inventor or to his assignee.

Persons not living in Switzerland must appoint a representative in that country.

PATENTABLE INVENTIONS.

New inventions which may be applied in the arts and are capable of being represented by models.

Inventions are not considered new which at the time of application for a patent are sufficiently well known in Switzerland to enable a person skilled in the art to execute them.

INVENTIONS EXCLUDED FROM PROTECTION.

Inventions which cannot be represented by models. Methods or processes cannot be patented.

NATURE AND DURATION OF THE PATENT—TAXES.

First. Patents of invention. Duration, fifteen years, to start from the date of the application.

Second. "Patents of addition." The same duration as the principal patent to which they refer.

A complete patent of invention is granted only upon proof of the existence of the model. In default of this proof a provisional patent is granted, which can be changed into a complete patent within a limit of three years, to date from the day of the application, by furnishing proof of the point in question.

Fee for filing, 20 francs; first annuity, 20 francs; second annuity, 30 francs, etc., increasing each year by 10 francs.

The "patents of addition" are subject only to the payment of the fee for filing.

Franc=$0.193.

APPLICATION—FORMALITIES AND DOCUMENTS.

The application for the patent must be addressed to the Federal Bureau of Intellectual Property.

There must be joined to it—

First, a description of the invention;

Second, the drawings necessary for the understanding of the description;

Third, the proof that a model of the object invented exists or that the invention itself exists;

Fourth, the sum of 40 francs, representing the fee for filing and the first annuity;

Fifth, a power of attorney if the application is filed by a representative;

Sixth, a declaration having the signature of the inventor, certified to by a competent authority or by a notary, establishing the right of the holders of the interest, if the patent is not applied for in the name of the inventor;

Seventh, a memorandum of the documents and articles filed.

The application must be written upon a form furnished by the administration.

The description of the invention and the drawings must be filed in duplicate. The application and the documents which are joined thereto must be written in one of the three languages, French, German, or Italian. All parts of the application must be in the same language.

The title under which the application is presented must designate in a precise manner the subject of the invention.

The applicant for the patent who desires to enjoy the benefit of a time allowance of priority established by international treaty may file the documents which establish the rights which inure to him from an anterior filing. He may also confine himself to mentioning upon the application form the facts serving as the basis for these rights.

The description of the invention must make known clearly its import and be so written that one skilled in the art may therefrom carry out the invention. It must terminate with a résumé of the features of the invention which are of special importance (claims).

The drawings, in duplicate, one copy on bristol-board and the other on tracing-cloth, must be executed under the following form: Thirty-three centimeters high by twenty-one wide, thirty-three centimeters high by forty-two wide, or thirty-three centimeters high by sixty-three wide. As far as possible the small or medium form should be used.

Each sheet of the drawings must be surrounded with a single line drawn two centimeters from the edge. It must have at the left, at the top, the name of the applicant and the date of the application, at the right, at the top, the number of sheets filed and the number of each sheet, and at the right, at the bottom, the signature of the person filing the documents of the application.

One of the duplicates, intended for photographic reproduction, must be executed upon strong, smooth, and white drawing-paper. It must be neither colored nor painted with a wash. The lines must be in good black ink. The hatchings must be separated.

The second duplicate must be a reproduction of the first upon tracing-paper. It may be colored.

The drawings must not be folded or rolled. They must be sent perfectly flat and not creased.

MODELS.

The proof of the existence of the model is shown—

First, by forwarding models of which the filing is obligatory, (watches or parts of watches, portable firearms, inventions which are essentially composed of substances difficult of identification, inventions which are characterised by properties which ordinary means of investigation do not admit of establishing;)

Second, by the permanent deposit of photographs representing the invention in a precise and complete manner;

Third, by a temporary deposit of models or satisfactory photographs, not to be permanently filed, but only for the purpose of comparison. (Fee for comparison in the Federal Bureau, 10 francs.)

THE GRANT.

Patents are granted upon proof that the documents and fees prescribed have been filed in the manner indicated by law.

In case of refusal the interested party may have recourse to the Federal Department of Justice and Police within four weeks.

WORKING.

Patented invention must be worked in Switzerland within three years from the date of the patent.

TUNIS.

(MEMBER OF THE INTERNATIONAL UNION.)

[Law of December 26, 1888. 49 O. G., 804.]

WHO MAY OBTAIN A PATENT.

Any person who makes application therefor may obtain a patent for any new discovery or invention in any class of industrial art.

PATENTABLE INVENTIONS.

The invention of new industrial products, the invention of new means, or the new application of known means for obtaining a result or an industrial product.

An invention is not considered new which in the Regency or abroad and previous to the date of filing the application has been made sufficiently public to admit of being practiced.

INVENTIONS EXCLUDED FROM PROTECTION.

Plans and combinations of trust or of finance, as well as inventions contrary to law or to good morals. If the invention relates to foods or to medicines, the patent cannot be granted for the product itself, but only for the special processes relating to its manufacture.

NATURE AND DURATION OF THE PATENT—TAXES.

First. Patents of invention. Duration, five, ten, or fifteen years, to start from the filing of the application.

Second. Certificates of addition. The same duration as the principal patent to which they refer.

The duration of patents granted for inventions already patented elsewhere cannot exceed that of the patents previously taken abroad.

Taxes: First, patents of invention, 100 piasters (francs) per year; second, certificates of addition, single tax of 20 piasters (francs).

Piaster (franc)=$0.193.

APPLICATION—FORMALITIES AND DOCUMENTS.

The applicant for a patent must produce at the Bureau of Industrial Property, at Tunis, a receipt for the payment at the office of the Receiver-General of the Tunisian Government of the first annuity of 100 piasters (francs) and forward to the said Bureau a sealed package containing—

First, an application;

Second, a description, in duplicate;

Third, one or several drawings, if the applicant considers them necessary for the understanding of the description;

Fourth, a memorandum of the documents filed.

The application must mention the duration of the patent, indicate concisely the subject of the invention, and be signed by the petitioner or his representative.

The original description must have at the top the word "Original," the copy the word "Duplicate." Both must be signed by the applicant or his representative. The description must be written in French and not contain any denomination of weights and measures other than those of the metric system.

The two copies of each drawing must be exactly alike, in good black ink, and may be on cloth or paper.

MODELS.

The applicant may file a model if considered necessary for the understanding of the description.

THE GRANT.

If the application is considered regular, it is published, with call for opposition. Time allowance of opposition, two months.

In case of opposition the patent is granted only after the applicant has obtained a decree of a competent tribunal.

WORKING.

Patented invention must be worked in Tunis within two years from date of patent, and working must not be discontinued for more than one year.

OFFICIAL GAZETTE, vol. 82, No. 6, May 10, 1898, abstract of law of Japan, p. 882, second column, eighth line from bottom, the value of the "yen" should be $0.498 instead of $1.00.

Notice to Show Cause.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 7, 1898.

The following notice to show cause is published in the OFFICIAL GAZETTE for the reason that it has been found impracticable to serve notice in the usual way, a registered letter containing notice to the same effect, mailed to Mr. Holgate at his last-known address, having been returned with the report that it could not be delivered.

To George H. Holgate, doing business under the name of the Association American Inventors, last known address Betz Building, Philadelphia, Pennsylvania, present address unknown:

SIR: Copies of charges filed against you as representative of the Association American Inventors by the following-named persons were sent you on the dates mentioned below, and you were given until February 12, 1898, to answer the same, if you desired to do so:

I. N. Fickes, of Holland, Kans.....January 21, 1898.
Nathan Lloyd, of Greenbrier, Mo.....January 22, 1898.
J. L. Zanger, of Cleveland, Ohio .....January 22, 1898.
John McWilliams, of Egypt Mills, Mo ..February 5, 1898.

You were informed in the letters accompanying the charges of McWilliams, Lloyd, and Fickes that, inasmuch as you were not registered as a patent attorney, disbarment proceedings would not be instituted. It has been determined, however, that inasmuch as you still represent a number of applicants before this Office in applications filed before the 1st of January, 1898, as is shown by a list of such cases filed by your representative on January 14, 1898, and in which registration was waived, said list numbering 171 cases, you are practicing before the Office and within the provisions of the statute you are subject to disbarment proceedings. In view of this fact and in view of the fact that in some of the foregoing cases the filing of the answer was made optional with you you are hereby required to show cause on or before the 15th day of June, 1898, in each of these cases, why you should not be disbarred from practice and why the Commissioner of Patents should not refuse to recognise you as patent agent in accordance with the statutes in such cases made and provided.

C. H. DUELL,
Commissioner.

Circular.

Attention is called to Order 769, dated November 26, 1898, which is as follows:

It is hereby directed that in the printing of claims of applications for patents the punctuation of the claims as made by applicants be strictly followed, and that the punctuation of the specification made by applicants be not departed from except to cure a manifest absurdity.

This order is still in force.

Examiners are prohibited from making any change in the claims or specification of an application without the consent of applicants or their attorneys; but when amendment becomes necessary the Office will duly advise, by letter, the applicant or his representative before passing a case to issue.

Roster of Registered Attorneys.

As an alphabetical list of the individuals and firms registered in this Office under the provisions of Rule 17 of the Rules of Practice, as amended August 6, 1897, is about to be published, it is directed that one copy of such list be furnished to each registrant free of charge, and that copies be furnished to the public at the nominal price of five cents each, a five-cent coupon being acceptable in payment therefor. One copy of each subsequent edition will be furnished gratuitously to each registrant whose name appears thereon for the first time in any edition.

Registrants are requested to give notice of any errors that may have occurred in the list as published.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business May 10, 1898.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	In arrears—Between two and three months.			
209	XIV. Metal-Bending, Wire-Working, Coin-Controlled Apparatus, Farriery, Nut and Bolt Locks, etc.	Feb. 21	Apr. 26	251
102	XIX. Stoves and Furnaces	Feb. 11	Apr. 26	260
89	XXXI. Gas, Painting, Hides, Skins and Leather, Alcohol, Oils, Fats, and Glue, etc.	Feb. 11	Apr. 25	257
153	XX. Builders' Hardware, Safes, Dentistry, Artificial Limbs, etc.	Feb. 10	Apr. 25	246
98	XXXIV. Railway-Brakes, Draft Appliances, and Rolling-Stock.	Feb. 26	Apr. 18	263
	Between three and four months.			
251	XIII. Metal-Working, Arms and Projectiles, Nails and Spikes, Needles and Pins, Cutlery, etc.	Jan. 31	May 2	221
223	X. Carriages and Wagons	Jan. 15	May 2	226
111	XXXII. Bottles and Jars, Carbonating Beverages, Shipping and Storing Vessels, etc.	Jan. 12	May 2	239
250	VIII. Furniture, Beds, Store Furniture, etc.	Feb. 7	Apr. 29	499
30	IV. Civil Engineering, Fire-Proof Buildings, Fire-Escapes and Ladders, etc.	Jan. 29	Apr. 28	404
255	XII. Mechanical Engineering, Store-Service, etc.	Feb. 9	Apr. 27	240
248	XVIII. Steam-Engineering, etc	Jan. 12	Apr. 27	308
246	I. Tillage and Fences	Feb. 1	Apr. 26	280
149	III. Metallurgy, Metal-Founding, Electro-Chemistry, etc.	Feb. 7	Apr. 25	244
120	IX. Hydraulics, Fire-Extinguishers, etc.	Jan. 10	Apr. 19	264
228	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	Jan. 28	Apr. 13	245
	Between four and five months.			
256	V. Fine Arts, Harvesters, Book-Binding, Music, etc.	Jan. 5	Apr. 30	251
98	XXI. Textiles, etc	Jan. 3	Apr. 28	316
97	XXVI. Electricity, Generation, Distribution, Motive Power, Electric Railways, etc.	Dec. 20	Apr. 27	215
109	XXII. Fire-Arms, Fishing and Trapping, Navigation, Signals, etc.	Jan. 3	Apr. 26	264
217	XXXIII. *Trade-Marks, etc., †Designs, Drafting, and Optics.	Dec. 31	Apr. 26	190
98	XXXV. Advertising, Baggage, Packing and Storing Vessels, Games and Toys, etc.	Dec. 27	Apr. 26	467
106	II. Farm Stock, Products, etc	Jan. 3	Apr. 25	505
258	VI. Chemistry, Explosives, Medicines, Fertilizers, Sugar and Salt, Surgery.	Dec. 28	Apr. 25	478
35	XXVIII. Pneumatics, Refrigeration, Air and Gas Engines, etc.	Dec. 11	Apr. 25	548
240	VII. Velocipedes	Dec. 13	Apr. 9	250
	Between five and six months.			
105	XI. Boots and Shoes, Clasps, Buckles and Buttons, Harness, Hose and Belting, and Leather-Working Machinery.	Dec. 2	May 2	743
211	XV. Plastics, Paper-Making, Paving, Glass, Fuel, Bread-Making, etc.	Nov. 22	May 2	508
122	XXIX. Wood-Working Machines, Carpentry, Coopering and Roofing, etc.	Nov. 17	Apr. 30	259
243	XXV. Artesian and Oil Wells, Mills, Threshing, Vegetable Cutters and Crushers.	Nov. 26	Apr. 28	411
95	XXX. Paper Manufactures. Lamps, and Gas-Fittings.	Nov. 26	Apr. 26	300
122	XXIV. Sewing-Machines, Apparel, and Toilet.	Dec. 8	Apr. 25	301
91	XVI. Telegraphy, Telephony, Electric Lighting and Signaling.	Nov. 25	Mar. 26	300

Applications Under Examination—Continued.

	Between six and seven months.			
221	XXIII. Instruments of Precision, Acoustics, etc.	Oct. 18	Mar. 21	493
	Between seven and eight months.			
215	XVII. Printing, Type-Writing Machines, and Linotyping.	Sept. 18	Apr. 15	541

Total number of applications awaiting action 13,868

Under one month.

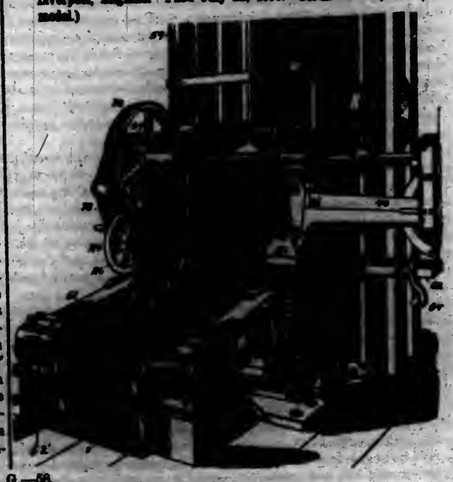
PATENTS

GRANTED MAY 17, 1898.

604,011. BICYCLE. JOHN A. ANDERSON, Wakefield, Mass. Filed June 17, 1897. Serial No. 641,128. (No model.)

Claim.—1. In a bicycle, in combination, the frame; the driving-shaft; the hub A provided with the flange A' and drum A''; the sleeve B provided with the flange B'; the pivot-pin D' extending inward from said flange B'; the U-shaped dogs C bifurcated at their lower ends and embracing said pivots; the ring D extending through and between the legs of said dogs; the pins C' extending through said U-shaped dogs and ring; the pedal-lever pivoted to the frame; a suitable band or cord connected with the sleeve; mechanism intermediate of the pedal-lever and said band or cord for actuating the latter and rotating the sleeve; and a spring for returning said sleeve into its normal position, substantially as described.

2. In a bicycle of the character described, the frame; driving-shaft; hub, and clutching mechanism adapted to engage said hub; the pedal-lever F, F' pivotally secured to the frame; the cam-wheel E supported by the short arm F' of the pedal-lever; a gear-wheel rigid with said cam-wheel; a gear-wheel pivoted to the frame and engaging the gear which is rigid with the cam-wheel; and a band or cord extending from the periphery of the cam-wheel to the clutching mechanism, whereby the speed of the driving-shaft is accelerated, substantially as set forth.



3. In a bicycle of the character described, the frame; driving-shaft; hub provided with the drum A'' inclosing a clutching mechanism; the lever L pivoted to the frame and provided with the rearwardly-extending arm L'' and downwardly-extending arm L'; the band-brake K extending around the drum and pivotally secured at its opposite ends to said rearwardly-extending and downwardly-extending arms; the lever N pivotally secured to the frame and with its rear end in engagement with said lever L; the elbow-lever P, P' provided with a foot-piece near the rear end of its long arm and with its short arm sustaining the roller or wheel S near the tire; and the rearward extension O from the lever P adapted to engage the forward portion of the lever N, whereby the pressure of the foot upon said foot-piece applies said roller as a brake to the tire and the band-brake to the drum, substantially as set forth.

4. In a bicycle of the character described, the frame; driving-shaft; hub and clutching mechanism adapted to engage said hub; the pedal-lever F F' pivotally secured to the frame; the cam-wheel E supported by the short arm F' of the pedal-lever; a gear-wheel rigid with said cam-wheel; a gear-wheel pivoted to the frame and engaging the gear which is rigid with the cam-wheel; the arm I pivoted to the frame and connected at one end by a link *g* with the short arm F' and at the other end by a link *l* with the gear-wheel pivoted to the frame, said arm I being formed with the dog or projection V'; the lever P, P', the long arm thereof being formed with the projection V adapted to be engaged by said dog V'; a band-brake upon the hub; mechanism intermediate of said lever P, P' and band-brake for tightening the latter upon said hub; and a band or cord extending from the periphery of the cam-wheel to the clutch mechanism, substantially as described.

5. In a bicycle, the frame; the driving-wheel; a lever pivotally secured to the frame and with one arm adapted to be pressed by the foot of the rider; a sliding holder supported by the outer arm of the lever in front of the tire of the driving-wheel; an elastic roller sustained by said holder and adapted to be pressed thereby against the tire by the action of said lever; a gong-ball rigid upon the spindle or axis of the roller; and a pin extending from said holder into engagement with the hammer of the gong, substantially as described.

6. In a bicycle, the frame; the driving-wheel; a lever pivotally secured to the frame and with one arm adapted to be pressed by the rider; the holder R R' supported by the outer end of said lever in front of the tire of the driving-wheel, the side portions R of said arm being provided with the slot R''; the spindle S' extending through said slots and held toward the wheel by suitable springs; the roller S fast on said spindle within the holder; a gong-bell rigidly secured to the spindle; and a pin extending from the holder into engagement with the bell, whereby the gong is sounded when the roller is rotated by its first contact with the tire, but silenced when the holder is applied with sufficient pressure against the roller to stop its rotation, substantially as set forth.

604,012. COTTON-PRESS. WILLIAM R. ANDERSON, Little Rock, Ark., assignor to the Standard Chrome Cotton Company, Limited, Liverpool, England. Filed July 22, 1895. Serial No. 556,773. (No model.)

Claim.—1. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of flanges having hollow central lugs mounted in said frame, a core extending between said flanges, a rod mounted in one of said hollow central lugs, and connected by screw-threads with the adjacent end of said core, and means for feeding cotton in the form of a sheet or bat to and around said core, substantially as set forth.

2. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of flanges having hollow cylindrical lugs revolubly mounted in said frame, a core extending between said flanges, a rod mounted in one of said cylindrical lugs, and connected by screw-threads with the adjacent end of the core, and means for feeding cotton in the form of a sheet or bat to and around said core, substantially as set forth.

3. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of flanges having hollow central lugs projecting into boxes formed in said frame, one of said flanges being longitudinally adjustable, a core having a tapped interiorly-screw-threaded end extending between said flanges and supported in said hollow lugs, a rod having a screw-threaded end, a shoulder mounted on the same and bearing against the projecting lug of the adjustable flange, means for operating said rod and thereby controlling the position of said adjustable flange, and means for feeding cotton in the form of a sheet or bat to and around said core, substantially as set forth.

4. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding the said belt, means for imparting tension to said belt, and means for imparting motion to the same, of a core mounted in the loop or bight of said belt, and means operated by the press for withdrawing said core, substantially as set forth.

5. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt, and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, means operated by the press for withdrawing said core, and means for automatically returning said core to its operative position, substantially as set forth.

6. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt, and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, means operated by the press for withdrawing said core, and a weight for automatically returning said core to its operative position, substantially as set forth.

7. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt, and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, flanges mounted upon both ends of said core adapted to guide the formation of the bale, and means operated by the press for withdrawing said core, substantially as set forth

8. In a machine for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt, and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, flanges mounted upon both ends of said core adapted to guide the formation of the bale, means operated by the press for withdrawing said core, and means for automatically returning said core to its operative position, substantially as set forth.

9. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt, and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, flanges mounted upon both ends of said core adapted to guide the formation of the bale, means operated by the press for withdrawing said core, and a weight for automatically returning said core to its operative position, substantially as described.

10. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, means operated by the press for withdrawing said core, and means for locking said core in its withdrawn position, substantially as set forth.

11. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, means operated by the press for withdrawing said core, means for locking said core in its withdrawn position, and means for automatically returning said core to its operative position, substantially as set forth.

12. In a press for making cylindrical cotton-bales, the combination with an endless belt arranged to form an expansible loop or bight, rolls for supporting and guiding said belt, means for imparting tension to said belt and means for imparting motion to the same, of a core mounted within the loop or bight of said belt, means operated by the press for withdrawing said core, means for locking said core in its withdrawn position, and a weight for automatically returning said core to its operative position, substantially as set forth.

13. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton is formed, means for feeding cotton in the form of a sheet or bat to and around said core, means operated by the press for withdrawing said core, and means for automatically returning said core to its operative position, substantially as set forth.

14. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton is formed, means for feeding cotton in the form of a sheet or bat to and around said core, means operated by the press for withdrawing said core, and a weight for automatically returning said core to its operative position, substantially as set forth.

15. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton is formed, means for feeding cotton in the form of a sheet or bat to and around said core, means operated by the press for withdrawing said core, and means for locking said core in its withdrawn position, substantially as set forth.

16. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton is formed, means for feeding cotton in the form of a sheet or bat to and around said core, means operated by the press for withdrawing said core, means for locking said core in its withdrawn position, and means for automatically returning said core to its operative position, substantially as set forth.

17. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton is formed, means for feeding cotton in the form of a sheet or bat to and around said core, a standard 40 projecting from said machine-frame, a worm-wheel 42 mounted in said standard, a worm 44 driven from the press normally disengaged from said worm-wheel 42 but adapted to be engaged therewith, and a connection between said worm-wheel and the core, substantially as set forth.

18. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which the bale of cotton is formed, means for feeding cotton in the form of a sheet or bat to and around said core, a standard 40 projecting from said machine-frame, a worm-wheel 42 eccentrically mounted in said standard, a worm 44 operated by the press and normally out of engagement with the said worm-wheel, a lever 45 for engaging the worm-wheel 42 with the worm 44, and a connection between said worm 42 and one end of the core, substantially as set forth.

19. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton may be formed, means for feeding cotton in the form of a sheet or bat to and around said core, means for withdrawing the core while the bale is in the press, and means for automatically returning the core in the press, substantially as set forth.

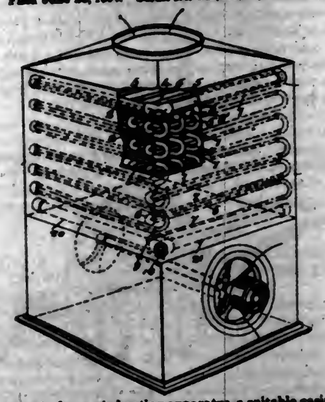
20. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton may be formed, a belt arranged to form an expansible loop or bight for feeding the cotton in the form of a sheet or bat to and around said core, means for withdrawing the core while the bale is still in the press, and means for automatically replacing the core in the press during the expulsion of the bale and before the loop or bight of the belt has passed the core, substantially as set forth.

21. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton may be formed, means for feeding cotton in the form of a sheet or bat to and around said core, means for withdrawing the core while the bale is still in the press, means for replacing the core in the press, and means for restraining said replacing means for operation, substantially as set forth.

22. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton may be formed, means for feeding cotton in the form of a sheet or bat to and around said core, means for withdrawing the core while the bale is still in the press, and a guideway for supporting said core when it is withdrawn from the press, substantially as set forth.

23. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton may be formed, means for feeding cotton in the form of a sheet or bat to and around said core, means for withdrawing the core while the bale is still in the press, a guideway for said core when it is withdrawn from the press, means for replacing the core in the press, and means stationed in said guideway for preventing the operation of the replacing mechanism, substantially as set forth.

24. In a press for making cylindrical cotton-bales, the combination with a machine-frame, of a core around which a bale of cotton may be formed, means for feeding cotton in the form of a sheet or bat to and around said core, means for withdrawing the core while the bale is still in the press, a weight attached to said core for replacing the same automatically, a guideway 52 for said core when it is removed from the press, and a weighted pawl 54 for holding the core in its withdrawn position, substantially as set forth.



25. In a press for making cylindrical cotton-bales, the combination with a belt arranged to form an expansible loop or bight, of a machine-frame, arms pivoted in said frame adapted to swing outward, a guide-roll stationed at the entrance of the loop or bight of the belt journaled in said arms, means for locking said arms in a closed position, a swinging lever 67 carried by one of said swinging arms, a lug for engaging with said swinging lever when the arms have moved partially outward, and a weight attached to said swinging lever for counterbalancing said pivoted arms during their movement, substantially as set forth.

26. In a press for making cylindrical cotton-bales, the combination with a belt arranged to form an expansible loop or bight, of a core within said loop or bight around which a bale of cotton may be formed, means for feeding cotton in the form of a sheet or bat to and around said core, and bent pieces 32 stationed at the entrance of the loop or bight of the belt for preventing spreading of the cotton, substantially as set forth.

27. In a cotton-press for making cylindrical bales, the combination of means for winding a continuous sheet or bat into a bale, and mechanism operating therewith for effecting pressure on the bale during its formation, comprising a hydraulic cylinder, a piston in said cylinder moved therein as the bale enlarges, and a closed air-chamber connected with said cylinder whereby as the bale enlarges the liquid will be forced out of said cylinder into said air-chamber to gradually compress the air in the latter, substantially as and for the purpose described.

28. In a cotton-press for making cylindrical bales, the combination of a core on which a continuous sheet or bat is spirally wound, a traveling pressure-surface movable away from said core with the enlarging bale, and revolving said bale so as to wind the sheet or bat thereon, a hydraulic cylinder, a piston therein connected with said traveling pressure-surface and moving in said cylinder as the bale enlarges, and a closed air-chamber connected with said cylinder, whereby as the bale enlarges the liquid will be forced out of said cylinder into said air-chamber to gradually compress the air in the latter, substantially as and for the purpose described.

604,013. AIR-HEATING APPARATUS. HENRY RAHN, St. Louis, Mo. Filed June 26, 1897. Serial No. 642,495. (No model.)

Claim.—1. In an air-heating apparatus, a suitable casing, steam-pipes disposed along the inner surfaces of two adjacent or contiguous vertical walls thereof, drain-pipes located below the steam-pipes and disposed along the same contiguous surfaces or walls of the casing, a series of coils leading from each steam-pipe to its corresponding drain-pipe or that disposed along the same wall, the one series intersecting the other at substantially the angle which the contiguous walls make with each other, and a fan located below the coils and carried by the wall of the casing, substantially as set forth.

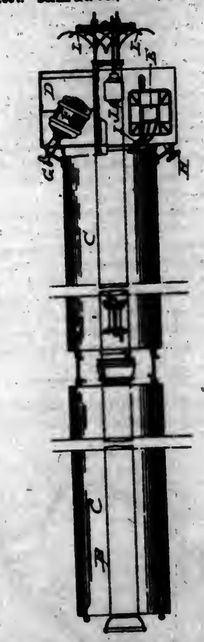
2. In an air-heating apparatus, a suitable casing, steam-pipes disposed along the inner surface of two adjacent walls thereof, a coupling at the meeting ends of the pipes for connection with a suitable steam-supply pipe, a series of pipe-sections secured directly to the peripheral wall of one of the pipes and leading to the opposite wall of the casing, a large U-shaped coupling at the further end of each of said pipe-sections, a return-pipe section leading back to the wall along which the main pipe is disposed, a small U-shaped coupling at the adjacent end of said return-pipe, a second pipe-section leading back to the opposite wall, and so on in repetition of the first arrangement whereby a series of coils disposed in vertical planes is formed, the last pipe of each member of the series terminating in a nipple disposed along the upper peripheral surface of a common drain-pipe disposed along the wall of the first or main pipe, a second series of coils intersecting the first series, said second series being similar to the first but reversely disposed thereto, that is to say, the adjacent steam and drain pipes having the arrangement and disposition of nipple connections and U-shaped couplings reversed, whereby the large U-shaped couplings of one series are disposed along a wall adjacent to that in which the large couplings of the other series are disposed, the pipe-sections coupled with the smaller U-shaped couplings occupying the space formed between the pipes connected by the large U-shaped couplings of the second series, the drain-pipes of the two series being connected to a common exit, and a suitable fan adapted to drive the air beneath the coils through openings formed in the opposite walls of the casing, substantially as set forth.

3. In an air-heating apparatus, a suitable casing, steam-pipes disposed along the inner surfaces of two adjacent or contiguous vertical walls thereof, drain-pipes located below the steam-pipes and disposed along the same contiguous surfaces or walls of the casing, and a series of coils leading from each steam-pipe to its corresponding drain-pipe or that disposed along the same wall, the one series intersecting the other at substantially the angle which the contiguous walls make with each other, the walls of the casing being provided with suitable openings for the admission of air to the system of pipes, substantially as set forth.

604,014. HOOF-SPREADING HORSESHOE. ELVIN S. BARROWS, Clarendon, Vt. Filed Sept. 28, 1897. Serial No. 653,587. (No model.)

Claim.—1. In a device of the class described, the combination of a shoe composed of two pivotally-connected sections adapted to be expanded, pivotally-mounted flanges projecting from the upper face of the shoe and arranged to bear against the walls of a hoof, said flanges being adapted to yield to the adjustment of the shoe in order to conform to the position of the walls of a hoof, and an adjusting device connecting the sides of the shoe, substantially as described.

2. In a device of the class described, the combination of a shoe composed of two pivotally-connected sections provided at their lower faces with recesses, sockets interposed between the sections of the shoe, provided with rounded inner edges and having outwardly-extending flanges pivoted in the said recesses, the lower faces of the sockets being substantially flush with the lower face of the shoe, and an adjusting-bar connecting the sockets, substantially as described.



3. In a device of the class described, the combination of a shoe composed of two sections pivotally connected and recessed at their upper and lower faces, plates arranged in the upper recesses and provided with upwardly-extending flanges, sockets located between the sections of the shoe and provided with outwardly-extending flanges arranged in the lower recesses, pivots passing through the sections of the shoe and connecting the plates and the sockets and securing them to the shoe, and an adjusting-bar connecting the sockets, substantially as described.

4. In a device of the class described, the combination of a shoe composed of two sections pivoted together at one side of the center of the front of the shoe and being of unequal length, sockets mounted on the sides or sections of the shoe near the rear ends of the same, the socket of the longer side or section being smooth and the other socket being threaded, and an adjusting-bar connecting the sockets

and having one end smooth and its other end threaded, substantially as described.

5. In a device of the class described, the combination of a shoe composed of two sections of unequal length pivoted together at one side of the front of the shoe, plates pivoted to the upper faces of the sections and provided with upwardly-extending flanges, sockets pivoted to the sections adjacent to the plates, one of the sockets being smooth and the other being threaded, and an adjusting-bar connecting the sockets and having one end smooth and its other end threaded to agree with the same, substantially as described.

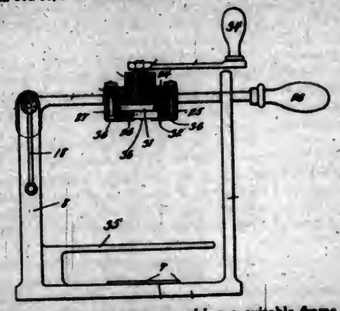
604,015. HYDRAULIC DREDGE. LINDON W. BATES, Chicago, Ill. Filed Aug. 9, 1897. Serial No. 647,603. (No model.)

Claim.—1. In combination with a dredge, a flexible buoyant discharge-pipe connected to and extending therefrom, and means controllable from the dredge for maintaining the discharge-pipe in any desired position.

2. In combination with a dredge, a flexible discharge-pipe connected to and extending therefrom carried upon a series of pontoons; and means controllable from the dredge for maintaining the discharge-pipe in any desired position.

3. In combination with a dredge, a flexible buoyant discharge-pipe connected to and extending therefrom; and means controllable from the dredge for swinging the end of said pipe to any desired point.

4. In combination with a dredge, a flexible discharge-pipe connected to and extending therefrom; a closed compartment carried by the end of said pipe; motors mounted in said compartment; and screws connected to the motors extending out upon opposite sides of the pipe.



5. In combination with a dredge, a flexible discharge-pipe connected to and extending therefrom; a closed compartment carried by the end of said pipe; motors mounted in said compartment; screws connected to the motors and extending out on opposite sides of the pipe; and means for controlling said motors from the dredge.

6. In combination with a dredge, a flexible discharge-pipe connected to and extending therefrom; a closed compartment carried by the end of said pipe and extending to each side thereof; motors mounted in said compartment upon each side of the pipe; screws G, H, connected to the motors extending in the general direction toward the dredge and at an angle to the pipe; and means for controlling the motors.

7. In combination with a dredge; a flexible discharge-pipe connected to and extending therefrom; a closed compartment carried by the end of said pipe and extending to each side thereof; motors mounted in said compartment upon each side of the pipe; screws G, H, connected to the motors extending in the general direction of the dredge and at an angle to the pipe; baffle-plates mounted in rear of the end of the discharge-pipe; a motor for moving said plates; and means for controlling said motors.

8. In combination with a dredge, a flexible discharge-pipe connected to and extending therefrom; screw-propellers mounted upon each side of the pipe at or near its end; baffle-plates mounted in line with the discharge end of the pipe; and means for controlling the propellers, and varying the position of the baffle-plates.

604,016. CAN-OPENER. PORTER BEAVERS, Rossville, Ala. Filed Oct. 31, 1896. Serial No. 610,774. (No model.)

Claim.—1. A can-opener, comprising a suitable frame, consisting of a base on which a can is adapted to be placed, said base being provided at one end with an upright or standard, a lever pivotally connected with the upper end of said upright or standard, an annular head secured to the lower side of said lever centrally thereof, a collar or sleeve mounted on the upper side of said lever over said annular head, a shaft which passes centrally through said lever, and through said collar or sleeve and provided at its lower end with a circular head which revolves in said annular head, and which is also provided with a cutter or blade which is secured thereto adjacent to one side thereof, said shaft being provided at its upper end with a crank substantially as shown and described.

2. A can-opener, comprising a suitable frame, consisting of a base on which a can is adapted to be placed, said base being provided at one end with an upright or standard, a lever pivotally connected with the upper end of said upright or standard, an annular head secured to the lower side of said lever centrally thereof, a collar or sleeve mounted on the upper side of said lever over said annular head, a shaft which passes centrally through said lever, and through said collar or sleeve and provided at its lower end with a circular head which revolves in said annular head, and which is also provided with a cutter or blade which is secured thereto adjacent to one side thereof, said shaft being provided at its upper end with a crank, said base being also provided with an upright or standard in the upper end of which is a slot adapted to receive the free end of said lever, substantially as shown and described.

604,017. SEED-PLANTER. ALONZO H. BLAKE, Wilmington, N. C. Filed July 20, 1897. Serial No. 646,193. (No model.)

Claim.—1. In a seed-planter, the divided annular conducting-ring provided at its terminals with suitable abutments and with the radial upward flanges forming between themselves a seed-conducting space, a pendent delivery-spout occupying the space between the terminals of the divided ring and hinged at one edge to one terminal of the ring, and a fastener to detachably connect the other side of the spout to the other terminal of said conducting-ring, combined with a shaft which passes through the ring, and a dropping-disk arranged on the shaft to have its peripheral edge work in the annular space of the ring and the chute and to be embraced internally by the flanges of said ring, substantially as described.

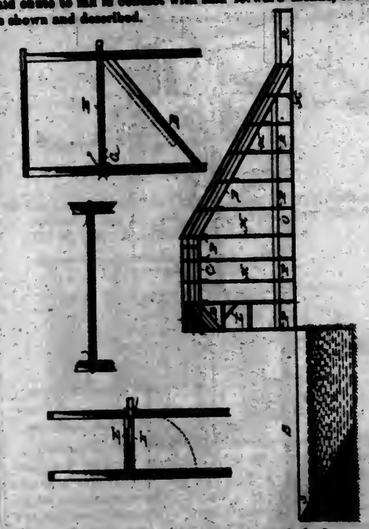
2. In a planter, a hopper having, as an integral part thereof, an annular, divided, conducting-ring closed at its terminals by suitable abutments and provided with flanges at the sides thereof, and an adjustable chute occupying the space between the terminals of said divided conducting-ring, combined with a dropping-disk fitted to rotate between the flanged conducting-ring and within the chute, substantially as and for the purposes described.

3. In a planter, the combination with a frame, an axle, and ground-wheels, of a dropping-disk carried by the axle and provided with pockets or cups, a hopper having, as a part thereof, a divided conducting-ring which circumferentially incloses the dropping-disk and is flanged to embrace the faces of said dropping-disk, and a hinged chute occupying the space between the terminals of said divided ring and detachably attached to one of the terminals of said conducting-ring, for the purposes described, substantially as set forth.

604,018. METHOD OF AND APPARATUS FOR CHARGING LIQUIDS WITH GAS. HENRY CARNEGIE, Malden, Mass. Filed June 16, 1897. Serial No. 640,902. (No model.)

Claim.—An apparatus for charging liquid with gas, which consists in a chamber provided with a liquid-inlet and with a liquid-outlet, a gas-inlet connected to the chamber near its bottom, a gas-outlet for the chamber near its upper end, and a single cock or valve controlling the gas and liquid outlets, substantially as described.

604,019. STOVEPIPE-LOCK. PATRICK J. CARROLL, PATRICK O. FREYER, LEWIS KLEIN, and LOUIS B. SELIGER, Shenandoah, Pa. Filed May 27, 1897. Serial No. 638,256. (No model.)



Claim.—The herein-described combination of two stovepipe-sections, one section being provided with a longitudinal slit and the other with a V-shaped tongue formed from the body of the pipe, said tongue being arranged transversely to the longitudinal axis of the pipe and bent inward to engage the slit upon the rotation of one section relative to the other, substantially as set forth.

604,020. STAGE APPLIANCE. WILLIAM F. CARVER, Chicago, Ill. Filed May 26, 1896. Renewed Apr. 7, 1898. Serial No. 676,698. (No model.)

Claim.—1. An apparatus or stage appliance consisting of an elevated platform having a downward and outward incline leading from the forward end of said platform to a body of water arranged below and in front of said incline, a chute hinged by its inner end contiguous to said platform and projecting in front of the same and over the incline at its forward end, means for supporting the outer end of said chute and means for releasing said end and causing said chute to fall in contact with said forward incline substantially as shown and described.

2. An apparatus or stage appliance consisting of an elevated platform having an inclined way leading from the ground or stage level to the rear end thereof, a downward and outward incline leading from the forward end of said platform to a body of water arranged below and in front of said latter incline, a chute hinged by its inner end contiguous to said platform and projecting in front of the same and over the incline at its forward end, means for supporting the outer end of said chute and means for releasing said end and causing said chute to fall in contact with said forward incline, substantially as shown and described.

3. An apparatus consisting of a horizontal platform a run or way leading to said platform a tower built in front of said platform, having an incline platform the upper end of which meets the forward end of said platform, a body of water at the foot of the forward end of said tower a chute hinged by its rear end to the rear upper portion of said tower and forming when in its normal position a continuation of said horizontal platform, a support pivoted to said tower and upholding the outer or free end of said chute when in its normal position, and means for releasing said support and swinging said chute downwardly upon said incline platform, substantially as shown and described.

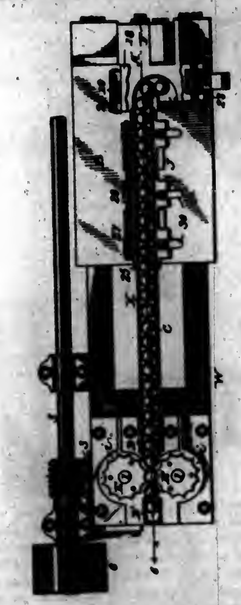
4. An apparatus consisting of an elevated horizontal platform an inclined way leading to the rear end thereof, a horizontal chute forming a continuation of said horizontal platform, its rear end being hinged and its forward end resting upon a cross-bar immediately above a body of water; the cross-bar pivoted at one end, its free end resting when in its normal position, upon a crank-arm and a lever for operating said crank-arm to release the free end of said bar, substantially as shown and described.

604,021. APPARATUS FOR BENDING PIPES. ROBERT CLARKE, Brooklyn, N. Y. Filed Dec. 30, 1897. Serial No. 664,264. (No model.)

Claim.—1. A pipe-bending machine, comprising a traveling die adapted to receive a pipe, means for moving the same, a bearing or holder for the pipe, and means for forcing a series of spheres through the pipe while it is forced through the die, substantially as described.

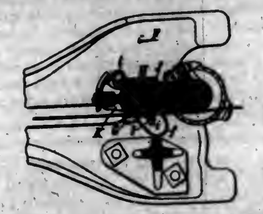
2. In a bending-machine, the combination of a stationary bearing or holder for the article to be bent, a carriage, a die upon the carriage and means for moving the carriage toward the stationary bearing or holder, substantially as described.

3. In a pipe-bending machine, the combination of a die, means for forcing a pipe through the die, and rotary devices for forcing a series of spheres through the pipe while it is being bent, the axis of the said rotary devices being at an angle to the line of movement of the pipe, substantially as described.



4. The combination of a stationary bearing for a pipe, a carriage, a die supported by said carriage and adapted to receive the end of the pipe, means for moving the carriage and a series of spheres, and means for propelling them through the pipe, substantially as described.

5. The combination with the die A and series of spheres, of propelling-wheels E, E adapted to receive and propel the spheres, substantially as described.

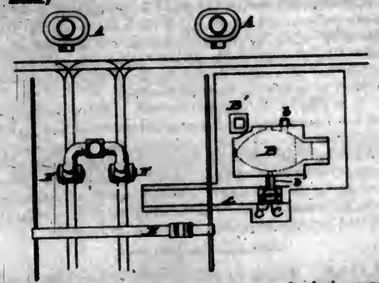


6. The combination with the die A, of a series of spheres, propelling-wheels E, E, and guide-tube D, D', substantially as described.

7. The combination of the traveling carriage B, die A, spheres and propelling-wheels, means for driving the wheels, means for propelling the carriage, and devices whereby to throw the carriage-propelling means into and out of operation, substantially as described.

8. The combination of the carriage, die, spheres, propelling-wheels, carriage-propelling screw F, shaft 5 geared to operate the propelling-wheels, gears 14, 15, 17 and a support for the gear 17, and means for shifting said support, substantially as described.

604,022. CORD-KNOTTER FOR GRAIN-BINDERS. PETER P. COLBY, Chicago, Ill., assignor to the McCormick Harvesting Machine Company. Filed May 15, 1897. Serial No. 636,835. (No model.)



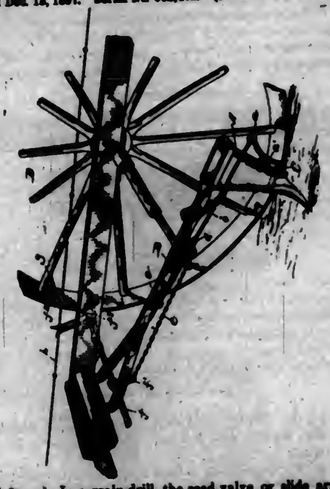
Claim.—1. In combination with a knotting-hook, a breastplate having a slot extending past the hook, a stationary stop positioned above the hook and extending across the slot in the breastplate from the same side as the knotting-hook and means whereby the cords are carried from the stop by the revolution of the knotting-hook.

2. In combination with a knotting-hook that trends outwardly, a breastplate having a slot that extends past the hook, a stop positioned on the knotter-frame and that extends across the cord-slot from the side of the knotting-hook, and a flange rotated by the knotting-hook, whereby the cords are removed from the stop by the revolution of the hook.

3. In combination in a knotter for self-binding harvesters, a stop projecting across the cord-slot, in a plane above that of the knotter-hook, a breastplate having a cord-slot that extends past the knotter, a tying apparatus having a hook that trends outwardly, a cord-holder for holding the cord, a flange attached to the knotting-hook, and revolving therewith, that in its path sweeps around the stop, and means for actuating the parts, substantially as and for the purpose specified.

4. In combination in a tying apparatus for self-binding harvesters, a breastplate having a cord-slot that extends past the knotter-hook, a knotter-hook that trends outwardly, and has a heel extension curved in the direction of the rotation of the knotter-hook, and a flange on the knotter-frame in the path of the rotation of the heel of the knotter-hook, substantially as and for the purpose specified.

604,023. PROCESS OF TREATING COPPER MATTE. JAMES COLEMAN, Clifton, Ariz. Filed Nov. 3, 1897. Serial No. 657,327. (No model.)

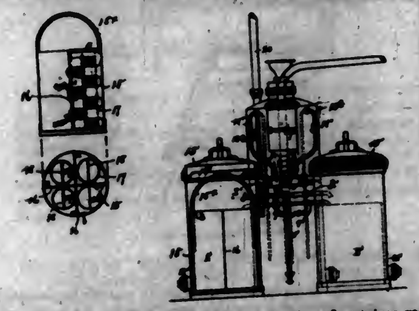


Claim.—1. As an improvement in the art of reducing copper by the Bessemer process, drawing off the molten matte from the blast-furnace, keeping it in a molten condition by an independent controllable source of heat, and altering its grade by the addition of suitable agents, substantially as described.

2. As an improvement in the art of reducing copper by the Bessemer process, storing the matte in a reverberatory furnace, and adding slags from the converter in order to clean them, substantially as described.

3. In apparatus for reducing copper by the Bessemer process, the combination with a blast-furnace and a converter, of a receptacle for the matte from the blast-furnace, and a separate furnace for maintaining and regulating the temperature of the contents of said receptacle, substantially as described.

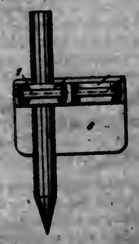
4. In apparatus for reducing copper by the Bessemer process, the combination with a blast-furnace and a converter, of a reverberatory furnace to receive the molten matte from the blast-furnace and store it until required by the converter, substantially as described.



604,024. GRAIN-DRILL. ELMER J. CORBIN, Macedon, N. Y. Filed Dec. 18, 1897. Serial No. 662,472. (No model.)

Claim.—1. In a grain-drill, the seed valve or slide arranged in the seed-boot and operated by a lever pivoted upon the latter, the rock-shaft having a chain or line connection with said valve or slide lever and having an arm adapted to be operated by a check-row wire, and a second arm adapted to be struck by a stud or projection on the transportion-wheel, substantially as set forth.

2. In a grain-drill, the seed slide or valve arranged in the seed-boot and carried by a lever pivoted upon the latter, the guide-rod connected to said slide or valve lever and adapted to pass through and rest in a bracket on the drill drag-bar, a chain or line connected to a lateral stud or projection arranged on said rod, said rock-shaft having two additional arms adapted to be actuated, one, by the check-row wire, and the other by a stud or projection of the wheel of the machine, substantially as set forth.

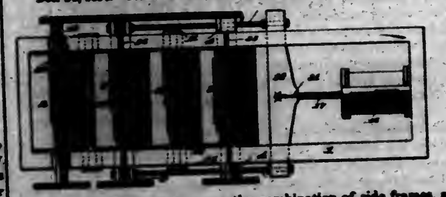


604,025. APPARATUS FOR PRODUCING ACETYLENE GAS. EMILE A. DESPUY, Paris, France. Filed July 2, 1896. Serial No. 597,583. (No model.) Patented in France Apr. 4, 1896, No. 253,259; in Luxemburg May 7, 1896, No. 2,889; in Belgium June 6, 1896, No. 121,720; in England June 9, 1896, No. 12,029; in Italy June 9, 1896, No. 41,788/251, and in Turin June 11, 1896, No. 152.

Claim.—1. In an apparatus for the production of acetylene gas, the combination of two generators, a basket or receptacle removably arranged in each of said generators and divided into compartments in communication with each other, a vessel in each of the latter adapted to receive calcium carbid, a water-pipe in communication with a compartment of each generator, a cock or valve adapted to regulate the supply of water to either of the compartments, a gas-outlet pipe in communication with the generators, a cock or valve adapted to control the communication of the gas-outlet pipe with either of the generators, an overflow water-pipe connecting the generators together and adapted to conduct the overflow from one generator into the other, and a valve or cock arranged in said overflow-pipe.

2. In an apparatus for the production of acetylene gas, the combination of generators, a water-pipe in communication with the generators, a cock or valve adapted to regulate the supply of water to either of the generators, a gas-outlet pipe in communication with the generators, a cock or valve adapted to control the communication of the gas-outlet pipe with either of the generators, an overflow water-pipe connecting the generators together and adapted to conduct the overflow from one generator into the other, a valve or cock arranged in said overflow-pipe, a water-reservoir with which the water-supply pipe is in communication, and pipes in communication with the gas-outlet pipe and leading into the reservoir, and adapted to have the opposite end submerged in the water contained in the reservoir.

604,026. PEN AND PENCIL HOLDER. JOHN DUNNE, (by order of court NOW JOHN BURNET,) Savannah, Ga. Filed Apr. 20, 1897. Serial No. 634,203. (No model.)



Claim.—A pen and pencil holder having a body-plate of stiff material, two cords arranged in front of the body-plate, and having their middle portions bowed outwardly therefrom, the body-plate having openings therein and an elastic band engaged with the front faces of the cords and passed through the openings in the body-plate whereby to hold the cords yieldingly against the body-plate.

604,027. POLISHER OR BRUSH. WILLIAM H. DURGIN, Hampton, Va. Filed July 3, 1897. Serial No. 643,933. (No model.)

Claim.—A device of the character described, comprising a handle of resilient material, formed with angular extensions at its ends, a band of suitable material extending between the ends of the handle and formed with pockets adapted to receive the angular extensions of the handle, fasteners secured to the band at its ends, beneath the pockets, substantially as and for the purpose set forth.

604,028. COTTON-PRESS. FRANK I. DYER, Washington, D. C., assignor to the American Cotton Company, New York, N. Y. Filed Dec. 21, 1896. Serial No. 616,461. (No model.)

Claim.—1. In a cotton-press, the combination of side frames, a baling-roll mounted in sliding boxes in said side frames, means co-operating with each of the sliding boxes for said baling-roll for allowing for a slight movement thereof, a second baling-roll cooperating with the first baling-roll, a pressure-producing device for the second baling-roll, and a core mounted in sliding boxes between said rolls, substantially as set forth.

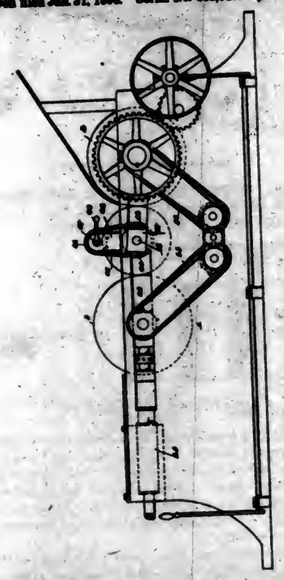
2. An improved tandem cotton-press comprising two baling-rolls, a third roll movable back and forth between the same, and means cooperating with one of the first-mentioned baling-rolls for forcing the same toward the intermediate roll, substantially as set forth.

3. An improved tandem cotton-press comprising two baling-rolls, a third roll movable back and forth between the same, means co-operating with one of the first-mentioned baling-rolls for forcing the same toward the intermediate roll, and a core between the third baling-roll and each of the two other baling-rolls, substantially as set forth.

4. In a cotton-press, the combination of side frames, a baling-roll mounted in sliding boxes in said side frames, a spring cooperating with each of the sliding boxes for said baling-roll, a second baling-roll cooperating with the first baling-roll, a pressure-producing device for the second baling-roll, and a core mounted in sliding boxes between said rolls, substantially as set forth.

5. An improved tandem cotton-press, comprising two baling-rolls, a third roll movable back and forth between the same, and springs cooperating with one of the first-mentioned baling-rolls and forcing the same toward the intermediate roll, substantially as set forth.

6. In a tandem cotton-press, the combination of two outside spring-pressed baling-rolls, and a third baling-roll, movable between the same, substantially as set forth.



7. In a tandem cotton-press, the combination of two outside spring-pressed baling-rolls, a third baling-roll movable between the same, and a pressure-producing device connected to the last-mentioned baling-roll, substantially as set forth.

8. In a tandem cotton-press, the combination of two spring-pressed baling-rolls, an intermediate baling-roll working between the same, a pressure-producing device connected to said intermediate baling-roll, and two cores between the intermediate baling-roll and the outside baling-rolls, substantially as set forth.

9. In a tandem cotton-press, the combination of two outside baling-rolls, an intermediate baling-roll working between the same, a hydraulic cylinder, connections between the cylinder and the intermediate baling-roll, a discharge-pipe extending up from each end of said cylinder, a relief-valve in each of said discharge-pipes, and a run-around for each relief-valve having check-valves therein, substantially as set forth.

10. In a tandem cotton-press, the combination of two outside baling-rolls, an intermediate baling-roll working between the same, a hydraulic cylinder, connections between the cylinder and the intermediate baling-roll, a discharge-pipe extending up from each end of said hydraulic cylinder, a relief-valve in each discharge-pipe, a lever cooperating with the stem of each relief-valve, a weight on each of said levers, and connections between both of said weights and an element movable with the intermediate baling-roll, substantially as set forth.

604,029. COTTON-PRESS. FRANK L. DYER, Orange, N. J., assignor to the American Cotton Company, New York, N. Y. Original application filed Nov. 26, 1894, Serial No. 530,251. Divided and this application filed Jan. 31, 1896. Serial No. 577,516. (No model.)

Claim.—1. The combination in a rotary press, of withdrawable baling-core-supporting centers, a core mounted on said centers, and means for withdrawing and advancing said centers from one side of the press and independently of the other movable parts of the press, substantially as set forth.

2. The combination in a rotary cotton-press, of two baling-rolls, means for driving said rolls, withdrawable baling-core-supporting centers, a core mounted on said centers between said rolls, and means for advancing and withdrawing said supporting-centers from one side of the press independently of the movable parts of the press, substantially as set forth.

3. The combination in a rotary cotton-press, of withdrawable baling-core-supporting centers mounted in sliding bearing-blocks, and a connection between said centers whereby they may be advanced and withdrawn simultaneously and independently of the other movable parts of the press, substantially as set forth.

4. The combination in a rotary cotton-press, of two baling-rolls, means for driving said rolls, withdrawable baling-core-supporting centers mounted in sliding bearing-blocks, and a connection between said centers whereby they may be advanced and withdrawn simultaneously independently of the other movable parts of the press, substantially as set forth.

5. In a cotton-press of the character described, the combination of two baling-rolls, means for driving said rolls, a core mounted between the same, means for supporting said core at each end thereof, and independent means for simultaneously releasing both ends of the core, substantially as set forth.

6. In a cotton-press of the character described, the combination of two baling-rolls in substantially the same plane, means for operating said rolls, a core mounted between said rolls, movable bearing-pieces for the ends of said core, and an operating-shaft connected with said bearing-pieces for simultaneously moving the same out of engagement with the core, said operating-shaft being mounted out of the plane of the rolls, substantially as set forth.

604,080. BICYCLE-BRAKE. JOHN C. REMY, Flemington, N. J., assignor of two-thirds to Frank B. Mallory and William W. Hawks, same place. Filed Sept. 19, 1896. Serial No. 606,294. (No model.)

Claim.—1. In a bicycle-brake, the combination of a handle-bar provided with a longitudinal slot, a revolvable sleeve provided with a spiral slot, a plunger provided with a pin which operates in said slots, a brake-shoe, balls interposed between the brake-shoe and the plunger for pushing the brake-shoe against the tire of the wheel and means for returning the brake-shoe, substantially as described.

2. In a bicycle-brake, the combination of a handle-bar provided with a longitudinal slot, an independently-removable sleeve slipped on the handle-bar and provided with a spiral slot which extends through the walls of the sleeve, a handhold secured to said removable sleeve, a plunger provided with a pin, a brake-shoe, balls interposed between the brake-shoe and the plunger for forcing the brake-shoe against the tire of the wheel, and a spring for returning the brake-shoe, substantially as described.

3. In a bicycle-brake, the combination of a handle-bar provided with a longitudinal slot, a revolvable sleeve fitted on the handle bar, and provided with a spiral slot, a handhold secured to said sleeve whereby it may be turned, a plunger provided with a pin which operates in the said slots, a brake-shoe, and balls interposed between the brake-shoe and the plunger for pushing the brake-shoe into operative position, and means for returning the brake-shoe, substantially as described.

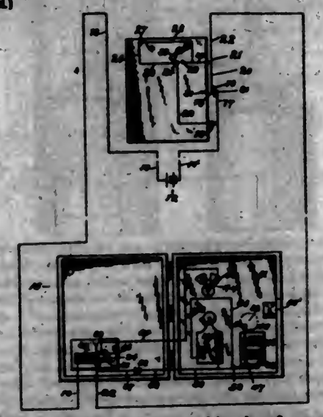
4. In a bicycle-brake, the combination of a handle-bar provided with a longitudinal slot, a revolvable sleeve fitted on the handle-bar, and provided with a spiral slot, a handhold secured to said sleeve, a plunger provided with a pin which operates in the said slots, a roller on said pin which bears against the walls of the slot in the handle-bar, and a shoe which bears upon the walls of the slot in the sleeve, a brake-shoe, flexible means interposed between the brake-shoe and the plunger for pushing the brake-shoe into operative position, and means for returning the brake-shoe, substantially as described.

5. In a bicycle-brake, the combination of a handle-bar provided with a longitudinal slot, a revolvable sleeve fitted upon the handle-bar, and provided with a spiral slot, a handhold secured to said sleeve, a plunger provided with a pin which operates in said slots, a brake-shoe, a tube or guideway secured in the handle-bar and guide-post, and balls in said tube, interposed between the brake-shoe and the plunger for pushing the brake-shoe into operative position, and means for returning the brake-shoe, substantially as described.

604,081. PAPER BOX. EDGAR FISHER, Toronto, Canada, assignor of one-half to Thomas Bell, same place, and Robert James Bell, New York, N. Y. Filed Sept. 17, 1897. Serial No. 652,097. (No model.) Patented in Canada Sept. 27, 1897, No. 57,891.

Claim.—1. A box comprising the two bottom triangular sides having a longitudinal central fold and the top folding flaps forming triangular ends and meeting in a cross-ridge in the center of the box and means for fastening the flaps together as and for the purpose specified.

2. A box comprising the two bottom triangular sides having a longitudinal central fold and the top folding flaps forming triangular ends and meeting in a cross-ridge in the center of the box and the projecting apexes a' and means for fastening the flaps together as and for the purpose specified.



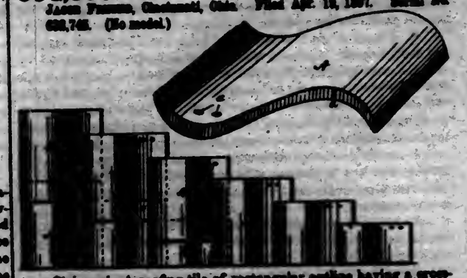
3. A box comprising the two bottom triangular sides having a longitudinal central fold and the top folding flaps forming triangular ends and meeting in a cross-ridge in the center of the box, projecting apexes a', opposing holes in the projecting apexes of the lower and upper flaps at one side and holes in the projecting apex of the upper flap at the opposite side and a cord passing through the opposing holes and designed to fasten the box together and form a carrying-loop therefor as and for the purpose specified.

604,082. WASHING-MACHINE. RUFUS A. FISHER, Hamilton, Mont. Filed May 25, 1897. Serial No. 638,114. (No model.)

Claim.—An improved washboiler comprising a suitable receptacle to contain the suds, in combination with the rotary shaft S removably journaled in said receptacle and provided with the parallel end disks S, S, and having a clothes-holder thereon made of a single piece of spring-wire bent to form two series of loops, at each end of the shaft, extending parallel with and fixed to the shaft, the loops of one series extending beyond the loops of the other series, substantially as shown and described.

604,088. ELECTRICAL SAFE-PROTECTION SYSTEM. ISAAC FISHER, Harrisburg, Pa. Filed June 15, 1897. Serial No. 640,344. (No model.)

Claim.—A safe-alarm system, comprising the safe, provided with the contact-points 16 and 21, a conductor extending from the point 16 to the point 21 and including one or more switches, the bottom 12 and the closed circuit 13 and 14 embracing the spring-fingers 17, 18 and the switch 18, in combination with the alarm-box 15, the magnet 22, core 23 and its armature 24, forming a part of the closed circuit 13, 14, the battery 26, conductor 27 connected to said armature 24, the contact-screw 30 located in the path of said armature, the switch 44, 45, the conductor 34 connecting said switch and screw 30, the alarm-bell 41, the conductor 43 connecting one post of said switch and bell and the conductor 29 connecting the opposite post of said bell with said battery 26, substantially as and for the purpose set forth.



604,084. BOOT-TREAD REINFORCE. ALFRED FRANKERT, Cologne, Germany. Filed Apr. 16, 1897. Serial No. 632,491. (No model.) Patented in England Apr. 30, 1896, No. 8,514.

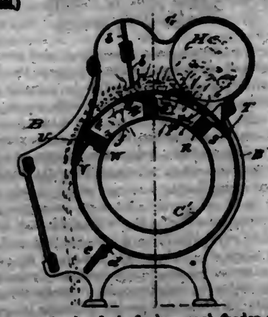
Claim.—1. A metal horseshoe consisting of the body A grooved as described from heel to heel and having nail-holes at the bottom of the groove, plates A and i, pin p, and steps S, in combination with the rope filling R and felt sole S, substantially as set forth.

2. The metal horseshoe consisting of the body A grooved as described from heel to heel and having nail-holes a at the bottom of the groove, the inclined notches a in the outer wall extending the depth of the shoe and corresponding with and leading to the nail-holes in the bottom of the groove, and pins p', in combination with the rope filling R, substantially as described.

604,085. TILE AND ARRANGEMENT THEREOF IN ROOFS. JAMES FLEMING, Cincinnati, Ohio. Filed Apr. 19, 1897. Serial No. 632,745. (No model.)

Claim.—1. A roofing-tile of rectangular outline having a cross-section oppositely curved from the center outward, in similar curves of diminishing radii, increasing the thickness of the material from the center to the apex of the curves and thence closing together to an acute-angled edge, whereby the tiles nest together in continuous contact; and, when laid, the overlapping surfaces present an elongated cross-opening of opposite arcs as a protection against capillary action, substantially as set forth.

2. A series of tiles of the general form described, of similar width but different lengths, laid so that the upper courses of uniform size overlay the lower courses at successively greater distances from the eaves producing a complete covering-joint, and a diagonal relation over the body of the roof, substantially as set forth.



604,086. HOSE-NOZZLE. JOHN H. FRY, Grand Rapids, Mich., assignor of one-third to Louis A. Cornelius, same place. Filed Aug. 11, 1897. Serial No. 647,781. (No model.)

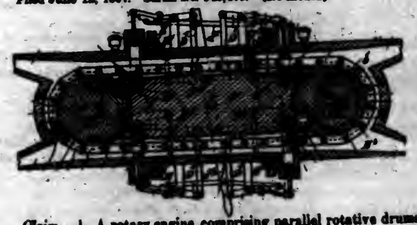
Claim.—1. A hose-nozzle consisting of a wooden body part, a metal ferrule for connecting the same with a hose, and lining or bushing tubes, substantially as described.

2. A hose-nozzle and sprinkler involving the combination of a wooden nozzle, a metallic ferrule, metal tubular lining or bushing for the nozzle, and a deflector permanently connected with the nozzle, substantially as described.

604,087. PNEUMATIC COTTON-HANDLING MACHINE. JAMES T. FULLER, Calvert, Tex. Filed Feb. 26, 1897. Serial No. 625,040. (No model.)

Claim.—1. A bank of gin-feeders, each feeder comprising end plates and a pipe-like hood open at the side thereof toward the center of the feeder, an air-tight dust-pipe open at the side thereof opposite to the said hood-opening, a revolving perforated cylinder surrounding said dust-pipe, and forming the bottom of said hood substantially in line with the bottom of the connecting-pipes between adjacent hoods, means to rotate said perforated cylinder, opposing pushing-flaps placed against said perforated cylinder for the hood and the dust-pipe, and sets of pipe connections for the hoods and dust-pipe, whereby a continuous supply-pipe with lateral openings opposite the feeders is formed, in combination with an exhaust-fan communicating

ing with said dust-pipe, an intake-pipe communicating with the hood-sections, and adapted to supply the cotton to said feeders under the suction produced by said fan.



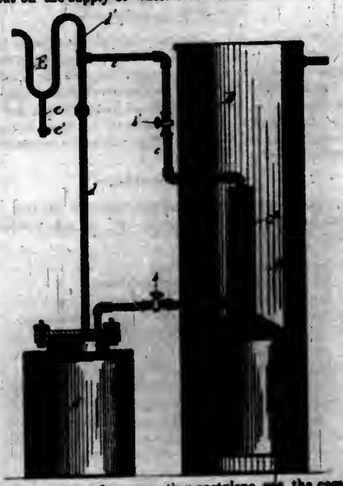
2. A bank of gin-feeders located in an axial line, each comprising end plates B', pipe-hood G, a central dust-pipe C supported by said ends and open laterally at F toward said hood, a perforated cylinder J rotatably mounted and surrounding said dust-pipe, packing for the joints at said lateral openings in the hood and dust-pipe respectively against said perforated cylinder, means to rotate said cylinder, pipe-sections C and H for connecting the dust-pipes and pipe-hoods respectively, an intake connection for one end of said pipe-hood, a cap for the other end of the line of hoods, an exhaust fan for one end of said dust-pipe, and a cap for the other end of the line of dust-pipes and connections.

3. A gin-feeder comprising end plates B', offset substantially as shown, and a pipe-hood G with an opening below, a dust-pipe passing through said plates, spider and ring supports for said dust-pipe, a perforated cylinder J having a ratchet on one end and mounted to rotate around said dust-pipe in said offset end plates, a push-pawl engaging said ratchet at one end, and an eccentric connection at the other end of the pawl.

4. A pneumatic gin-feeder comprising a central dust-chamber having a large and a small inlet-opening at the side, a screen-cylinder encircling said dust-chamber, packing-strips around said openings filling the interposed space between said chamber and screen-cylinder, a hood above said packed openings, matching packing-strips between said hood and screen-cylinder, means to allow the exit of the cotton-bat, a rotatable leveler in said hood adapted to act on the bat as it passes away from said large opening, and exhaust means to effect a suction of the air through said inlet-openings to the dust-chamber, and hold the bat with varying pressure as the screen carries it past said inlet-openings.

5. A pneumatic gin-feeder comprising a central dust-chamber having large and small inlet-openings, a rotatable screen-cylinder encircling said chamber, interior packing interposed around and between said inlet-openings and the screen-cylinder, a hood above said openings, exterior packing between the hood and cylinder matching the interior packing, a rotatable leveler consisting of a shaft having flexible blades mounted opposite the interior middle packing, a supply-pipe and exit-opening for the cotton-bat for said hood, and exhaust means communicating with said dust-chamber.

604,088. ROTARY ENGINE. AUGUSTUS H. GILBERT, Berlin, N. H. Filed June 12, 1897. Serial No. 640,470. (No model.)



Claim.—1. A rotary engine, comprising parallel rotative drums, a chain passing about said drums, and having plates attached thereto and acting as pistons, a casing surrounding the paths of said pistons and also extending within the chain between the drums, said casing having steam inlet and exhaust ports and valves controlling the steam-ports, abutments having slots to accommodate the chain, cams mounted upon the drum-shafts, and mechanism connecting said cams with the abutments and valves, substantially as described.

2. A rotary engine having two sets of abutments and steam-valves adapted to be alternately used in reversing the operation of the engine, vibrating levers actuating said valves, each of said levers being composed of two parts pivoted to each other, and a coupling block or sleeve adapted to connect and disconnect the two parts to make of them a rigid or a jointed lever, substantially as described.

3. A rotary engine having two sets of abutments and steam-valves adapted to be alternately used in reversing the operation of the engine, vibrating levers actuating the same, each composed of two parts pivoted to each other, a coupling block or sleeve adapted to connect and disconnect the two parts to make of them a rigid or a jointed lever, a common reversing-lever, and links connecting the same with said coupling-blocks, substantially as described.

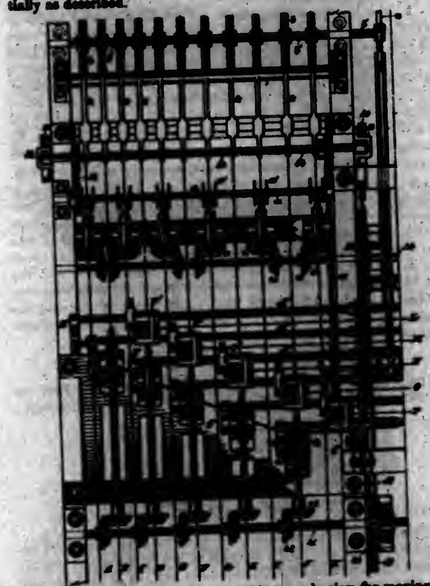
604,089. ACETYLENE-GAS GENERATOR. ROBERT GOSS, Three Rivers, Canada. Filed Oct. 7, 1897. Serial No. 654,472. (No model.) Patented in England July 19, 1897, No. 17,081; in France Nov. 18, 1897, No. 268,980, and in Canada Nov. 22, 1897, No. 56,166.

Claim.—1. An apparatus for generating acetylene gas, comprising a vessel for carbid; a vessel open at its top for the water; an internal vessel open at its bottom, and having an extension, said internal vessel being mounted within the water vessel; a gas-outlet pipe connected to said vessel for the carbid; an auxiliary pipe connected to the top of said extension and said gas-outlet pipe; and a connection between the top of said vessel for the carbid and said extension, the opening of said pipe in said extension being below the opening of the auxiliary pipe, whereby the surplusage of gas will serve to automatically cut off the supply of water to the carbid.

2. In apparatus for generating acetylene gas, the combination, with a vessel A for holding metallic carbids, of a vessel B for holding water, an internal vessel C open at the bottom and supported in the vessel B, a gas-outlet pipe connected to the upper parts of the vessels A and C, a pipe connecting the vessel A with the vessel C at a point below the said gas-pipe, and a gas-relief pipe D connected to said internal vessel near its bottom, substantially as set forth.

3. In apparatus for generating acetylene gas, the combination with a vessel A for holding metallic carbid, of a vessel B for holding water, an internal vessel C open at the bottom and supported in the vessel B, a gas-outlet pipe *d* connected to the vessel A, a pipe *e* provided with a valve and connected to the pipe *d* and to the upper part of the vessel C, a pipe *d'* provided with a valve and connected to the vessel A and to the vessel C at a point below the pipe *e*, and a gas-relief pipe D connected to said internal vessel near its bottom, substantially as set forth.

604,040. COVER FOR CROCKS, &c. WILLIAM GRIMSH and HARVEY W. SMITH, Carrsville, Mich. Filed June 9, 1897. Serial No. 640,008. (No model.)



Claim.—The combination with a crock, and a fastening ring or band, of a removable cover constructed of flexible material and comprising a horizontal top portion, depending crimped or folded sides receiving the ring or band, and a stiff horizontal flange formed by expanding and extending outward the lower edges or portions of the depending sides and supporting the ring or band both when the cover is on and off the crock, said flange also serving as a grip or handle to enable the cover to be readily placed on and removed from the crock, substantially as described

---

604,041. MACHINE FOR MAKING WIRE FENCING. JOHN W. GREWOLD and ABEL C. GELDERWAIT, Troy, N. Y. Filed Nov. 23, 1897. Serial No. 659,571. (No model.)

Claim.—1. In a wire-fence-making machine, mechanism for moving three strand-wires in a longitudinal direction, mechanism for moving a transverse wire in a longitudinal direction across said strand-wires, mechanism for cutting said transverse wire to definite length, mechanism for securing said divided piece of transverse wire between its ends to the middle strand-wire, and mechanism for securing the ends of said divided piece of transverse wire respectively to the other strand-wires, substantially as described.

2. In a wire-fence-making machine, mechanism for moving five strand-wires G, H, I, J, K in a longitudinal direction, mechanism for moving a transverse wire in a longitudinal direction across the strand-wires G, H, I, mechanism for moving a second transverse wire in a longitudinal direction across the strand-wires I, J, K, mechanism for severing said first transverse wire between its ends to the strand-wire H, mechanism for severing the ends *p*, *q* of said transverse wire to the strand-wires G, I, mechanism for severing said second transverse wire between the ends of the strand-wire J and mechanism for securing the ends *r*, *s* of said second transverse wire I, K, substantially as described.

3. In a wire-fence-making machine, mechanism for moving three strand-wires in a longitudinal direction, mechanism for moving a transverse wire in a longitudinal direction across said strand-wires, mechanism for cutting said transverse wire to definite length, mechanism for securing said divided piece of transverse wire between its ends to the middle strand-wire, and mechanism for severing the ends of said divided piece of transverse wire respectively to the other strand-wires, substantially as described.

4. In a wire-fence-making machine, mechanism for moving three strand-wires in a longitudinal direction, mechanism for moving a transverse wire in a longitudinal direction across said strand-wires, mechanism for twisting the body portion of said transverse wire around the middle strand-wire, and mechanism for twisting the ends of said transverse wire respectively around the other strand-wires, substantially as described.

5. In a wire-fence-making machine, mechanism for moving three strand-wires H, I, J in a longitudinal direction, the said strand-wires H, J being provided with transverse wires secured to them and having ends *r*, *q*, alternately crossing the middle strand-wire I, and mechanism for securing said ends to said strand-wire I, substantially as described.

6. In a wire-fence-making machine, mechanism for moving three strand-wires H, I, J in a longitudinal direction, mechanism for moving transverse wires alternately across the wires H, I, and I, J, mechanism for securing said transverse wires between their ends to the wires H, J and mechanism for securing the ends *r*, *q* of said wires alternately to the strand-wire I, substantially as described.

7. In a wire-fence-making machine, mechanism for feeding a series of strand-wires, mechanism for feeding a series of parallel transverse wires in a plane parallel to that of said strand-wires, mechanism for cutting the transverse wires, and mechanism for securing each section of transverse wire between its ends to one of said strand-wires, substantially as described.

8. In a wire-fence-making machine mechanism for feeding a series of strand-wires, mechanism for feeding a series of parallel transverse wires in a plane parallel to that of said strand-wires, mechanism for cutting the transverse wires, and mechanism for winding each section of transverse wire around one of said strand-wires, substantially as described.

9. In a wire-fence-making machine, mechanism for feeding a series of parallel strand-wires, mechanism for feeding a series of parallel transverse wires in a plane parallel to that of said strand-wires, whereby each strand-wire is overlapped by a transverse wire for a determinate distance, mechanism for cutting the transverse wire, and mechanism for securing each section of transverse wire between its ends to one of said strand-wires, substantially as described.

10. The combination in a wire-fence-making machine, of three twisting devices *g*, A, *i*, mechanism for moving three strand-wires through said twisting devices, a feeding mechanism operating to move a transverse wire O across said strand-wires, and a cutting device for said strand-wire; the aforesaid parts being constructed and timed so that after said transverse wire shall have been moved across the middle strand-wire by the said feeding mechanism, the twisting devices A shall twist said divided piece of transverse wire between the ends upon the middle strand-wire, the said cutting device shall then operate to cut it to definite length, and thereafter the twisting devices *g*, *i* shall twist the ends *p*, *q* of said divided piece of transverse wire respectively upon the other strand-wires, substantially as described.

11. The combination in a wire-fence-making machine of mechanism for moving three strand-wires H, I, J in a longitudinal direction, the said strand-wires H, J being provided with transverse wires secured to them and having ends *r*, *q* alternately crossing the middle strand-wire I, and a twisting device through which said strand-wire I passes; the said twisting device operating upon the ends *r*, *q* to twist said ends around said wire I, substantially as described.

12. The combination in a wire-fence-making machine, with mechanism for moving a series of strand-wires in a longitudinal direction, of twisting devices A disposed in series diagonally with reference to the line of movement of said wires, through which twisting devices said wires move, mechanism for feeding a series of transverse wires simultaneously across said strand-wires and to said twisting devices, and a series of cutting devices disposed diagonally and similarly to said twisting devices and cutting upon said transverse wires respectively; the aforesaid parts being constructed and timed so that a transverse wire shall be fed simultaneously over each strand-wire, then twisted at its middle around said strand-wire, and then cut to definite length by a cutting device, substantially as described.

13. The combination in a wire-fence-making machine with mechanism for moving two series of strand-wires simultaneously in a longitudinal direction; the wires of one series as D, F, H, J alternating with the wires of the other series, as E, G, I, of twisting devices as A disposed in series diagonally with reference to the direction of movement of said wires, through which twisting devices said wires D, F, H, J pass, a second series of twisting devices, as *g*, staggered in position with reference to said first series, through which second series said wires E, G, I, pass, mechanism for feeding a series of transverse wires simultaneously across said strand-wires D, F, H, J and to said first series of twisting devices and a series of cutting devices disposed diagonally and similarly to said first series of twisting devices and acting upon said transverse wires respectively; the aforesaid parts being constructed and timed so that a transverse wire shall be fed simultaneously over each strand-wire D, F, H, J, then twisted at its middle by a twisting device as A around its associate strand-wire, then cut to definite length by a cutting device, and then carried outward by said strand-wire until its ends meet two twisting devices as *g*, *i*, of the second series whereby its said ends *p*, *q* are twisted around the adjacent strand-wires G, I, substantially as described.

14. In a machine for making wire fencing having longitudinal or strand wires and transverse wires uniting said strand-wires mechanism for producing short bends laterally projecting from said strand-wires at the junctions of said strand-wires and said transverse wires, substantially as described.

15. In a machine for making wire fencing, a plurality of twisting devices through which the strand-wires of the fence are fed, mechanism for simultaneously feeding the transverse wires to said twisting devices, mechanism for cutting said transverse wires into lengths to extend from the strand-wires wherever they are twisted to adjacent strand-wires, and mechanism for producing crimps or bends in the strand-wires at the junction of said strand and transverse wires, substantially as described.

16. In a wire-fence-making machine, mechanism for moving two strand-wires in a longitudinal direction, one of said wires being provided with a transverse wire projecting across said other strand-wire, a twisting device through which said second strand-wire passes, and operating to twist said transverse wire at one end about said second strand, and means for forcing the end of said transverse wire into close engagement with said twisting device, substantially as described.

17. The combination of a twisting-head having a rotary spindle f

and pin *a'* with the rotary shaft *a* having finger *d'*, substantially as described.

18. The combination in a wire-crimping device of a bar *c*, having pairs of pins as *c*, *c'* adapted to receive between them the wire to be crimped, means for holding said wire between said pins, and mechanism for moving said bar in a direction transverse said wire, substantially as described.

19. The combination in a wire-crimping device of the bar *c* having pairs of pins as *c*, *c'*, adapted to receive between them the wire to be crimped, means for holding said wire in tense condition between said pins, a presser-bar for said wire and mechanism for moving said bar *c* in a direction transverse said wire, substantially as described.

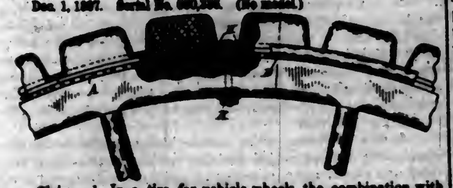
20. The combination in a multiple wire-crimping device of a bar *c* having as many pairs of pins *c*, *c'* as there are wires to be crimped, and adapted to receive said wires between them, means for holding said wires parallel and in tense condition, and mechanism for moving said bar transversely the direction of said wires, substantially as described.

21. The combination in a multiple wire-crimping machine of a bar *c*, having as many pairs of pins *c*, *c'* as there are wires to be crimped, and adapted to receive said wires between them, means for holding said wires parallel and in tense condition, a series of presser-bars acting upon said wires, mechanism for simultaneously operating said presser-bars, and mechanism for moving said bar *c* transversely the direction of said wires, substantially as described.

22. The combination in a wire-crimping machine of the bar *c*, having pins *c*, *c'*, ways *c'* in which said bar *c* slides longitudinally, rotary shaft 49, cam-disk 55 thereon, vibrating lever 57 actuating bar *c* and having pin 60 entering the groove of said cam-disk, substantially as described.

23. The combination in a wire-crimping device of the bar *c* having pins *c*, *c'*, ways *c'* in which said bar *c* slides longitudinally, rotary shaft 49, cam-disk 55 thereon, vibrating lever 57 actuating bar *c* and having pin 60 entering the groove in said cam-disk 55, pivoted presser *h*, lifting-bar 54, support-bar 52 therefor, and cam 50 on shaft 49 actuating said support-bar 52, substantially as described.

24. In a wire-fence-making machine, a plurality of twisting devices through which the strand-wires of the fence are fed, mechanism for simultaneously feeding the transverse wires to said twisting devices and mechanism for cutting said transverse wires into lengths to extend from each side of the strand-wires whereon they are respectively twisted to the adjacent strand-wires, substantially as described.



25. In a wire-fence-making machine a plurality of twisting devices through which the strand-wires of the fence are fed, mechanism for simultaneously feeding the transverse wires to said twisting devices, mechanism for cutting said transverse wires into lengths to extend from each side of the strand-wires whereon they are respectively twisted to adjacent strand-wires, a winding-drum whereon said strand-wires are wound, and mechanism for actuating said drum, substantially as described.

26. In a wire-fence-making machine, the combination of the rotary shaft 5, cam 6, bar 9, actuating said cam, vibrating arms 10 and 11 actuated by said bar and carrying sectors 12, rack-bar 13 engaging with said sectors, rack-bar 16 carried by bar 13, lever 18 having sector 17 engaging with bar 16, rock-shaft 21 and wire-feeding devices actuated from said rock-shaft, substantially as described.

27. In a wire-fence-making machine, the combination of the rotary shaft 5, cam 27 thereon, pivoted arm 26, arm 29, rod 30, pawl 32, ratchet-wheel *n* actuated by said pawl, and a wire-feeding device actuated from said ratchet-wheel, substantially as described.

28. In a wire-fence-making machine the combination of the rotary shaft 5, cam 33 thereon, bar 36 actuated by said cam, pivoted arms 37 carrying sectors 28, gears actuated by said sectors and wire-twisting devices actuated from said gears, substantially as described.

604,042. ELASTIC TIRE. FRANK B. HALL, Quincy, Mass. Filed Dec. 1, 1897. Serial No. 660,206. (No model.)

Claim.—1. In a tire for vehicle-wheels, the combination with blocks or sections of india-rubber having flat bases with flanges at the sides and ends and adapted to rest upon the periphery of a wheel, of a band B, composed of side bars with flanges that embrace the side edges of the wheel, and cross-bars E, the said band being applied over the said rubber blocks with the side bars bearing on the flanges at the sides and the cross-bars over the flanges at the ends of said blocks, and means for drawing together the ends of the band and holding it to the wheel, as set forth.

2. In a tire for vehicle-wheels, the combination with blocks or sections of india-rubber having flat bases with flanges at the sides and ends and adapted to rest upon the periphery of a wheel, of a band B composed of side bars with flanges that embrace the side edges of the wheel and having channels or grooves G in their under surfaces, and cross-bars E, the said band being applied over the said rubber blocks with the side bars bearing on the flanges at the sides and the cross-bars over the flanges at the ends of said blocks and means for binding the said band firmly to the wheel whereby the flanges of the blocks will be forced up into the channels or grooves G, as set forth.

3. The combination in a wheel-tire with blocks or sections of india-rubber having flat bases with flanges at the sides and ends and adapted to rest upon the periphery of a wheel, and reinforcing plates or strips L secured to the said bases, of a band B composed of side bars with flanges that embrace the side edges of the wheel, and cross-bars E, the said band being applied over the rubber blocks with the side bars bearing on the flanges at the sides and the cross bars over the flanges at the ends of said blocks, and means for drawing the band tightly about the wheel and thereby clamping the rubber blocks in position, as set forth.

604,043. MATTRESS. OLIVE R. HALL, Oconto, Wis. Filed Jan. 20, 1898. Renewed Mar. 30, 1898. Serial No. 674,509. (No model.)

Claim.—1. The combination with a mattress, of the strip E arranged outside of, and rigidly fastened to, the mattress and extending from the bottom around the two sides and top thereof, and the strip F extending around the bottom and two sides of the mattress and permanently fastened to the ends e^2 of the strip E and the bottom of the mattress, the loose or free ends *f* of said strip F forming the handles, for the purposes described, substantially as set forth.

2. The combination with a mattress, of the external strip or band E fastened to the sides and top of the mattress and having its ends e^2 carried around and fastened to the bottom thereof, and the strip F secured permanently to the bottom of the mattress and the ends e^2 of the strip E, the free ends *f* of the strip F extending around the sides of the mattress and detachably fastened, at *g*, to the strip E, for the purposes described, substantially as set forth.

604,044. ORTHOPEDIC APPLIANCE. ALBERT H. HAMEL and ARTHUR H. HIBBERT, De Soto, Mo.; said Hibbert assignor to said Hamel. Filed Aug. 14, 1897. Serial No. 648,211. (No model.)

Claim.—1. An orthopedic appliance comprising a shoe, a supporting-frame projecting upwardly and laterally from the heel thereof, a cord fastened at one end to the fore part of the shoe, and means mounted on said supporting-frame for regulating the tension of said cord, substantially as and for the purpose set forth.

2. An orthopedic appliance comprising a shoe having a drum-support thereto fastened at the heel, a drum mounted on said support, a cord fastened at one end to the fore part of the shoe and at the other end to said drum, and means for winding said drum and thereby regulating the tension on said cord, said drum being located above and aside from the sole of the shoe, substantially as and for the purpose set forth.

3. An orthopedic appliance comprising a shoe, a drum mounted on a support secured at the heel of the shoe, a cord attached to said drum and to the fore part of the shoe, and a spring tending to wind said drum, substantially as and for the purpose set forth.

4. An orthopedic appliance comprising a shoe, a vertically-arranged drum mounted on a support fastened thereto at the heel, a cord attached to said drum and to the fore part of the shoe respectively, and means tending to wind said drum, substantially as and for the purpose set forth.

5. An orthopedic appliance comprising a shoe, a vertically-arranged drum mounted on a support fastened at the heel, a cord attached to said drum and to the fore part of the shoe, and a helical spring secured at its lower end to said drum and at its upper end to a band adapted to be fastened to the patient's limb, substantially as and for the purpose set forth.

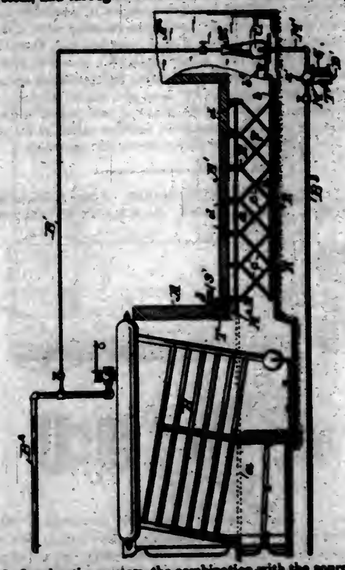
6. An orthopedic appliance comprising a shoe, a vertically-arranged drum mounted on a support fastened at the heel, a cord attached to said drum and to the fore part of the shoe, a helical spring secured at its lower end to said drum and at its upper end to a band adapted to be fastened to the patient's limb, and a jointed upright bar secured at the heel on the side opposite the drum-support, and having a band adapted to encircle the patient's limb, substantially as and for the purpose set forth.

604,045. CHILD'S CHAIR. FRED C. HAMBAM, Kenosha, Wis., assignor to the Kenosha Crib Company, same place. Filed Aug. 4, 1897. Serial No. 647,042. (No model.)

Claim.—1. In a child's chair, the combination, with an axle, of a chair-frame tiltable thereon or therewith, consisting of side bars, front bars extending downwardly, the lower ends thereof forming a lower forward support, and handle-bars extending rearwardly at their lower ends to form steps.

2. In a child's chair, the combination, with an axle, of a chair-frame tiltable thereon or therewith, said frame consisting of side seat-bars, extending rearwardly and obliquely, front bars extending downwardly, the lower ends thereof forming a lower forward support, and handle-bars secured to the obliquely and rearwardly extending portions of the side bars, and extended rearwardly therefrom to form steps.

3. In a child's chair, the combination, with an axle, of a chair-frame tiltable thereon or therewith, and consisting of side seat-bars extending rearwardly and obliquely, front bars extending downwardly, their lower ends forming a lower forward support, and handle-bars secured to the obliquely and rearwardly extending portions of the side bars, and projecting rearwardly therefrom, and curved upwardly to form steps.



4. In a child's chair, the combination, with an axle, wheels mounted thereon, and springs secured to the axle and extending upwardly therefrom, of a chair-frame supported by the springs and tiltable therewith, said frame consisting of side seat-bars, front bars extending downwardly, their lower ends forming a forward lower support, and handle-bars.

5. In a child's chair, the combination, with an axle, of a chair-frame mounted above the same, and tiltable thereon or therewith, said frame consisting of side seat-bars bent downwardly at their forward ends to form front bars, said front bars forming at their lower ends a lower forward support, and said side bars also bent rearwardly and obliquely, and handle-bars secured to the rearwardly and obliquely extending portions of the side bars, and projecting rearwardly beyond the same to form rear steps.

6. In a child's chair, the combination, with an axle, wheels mounted thereon, and springs secured to the axle and extending upwardly therefrom, of a chair-frame supported by the springs and tiltable therewith, said frame consisting of side seat-bars bent downwardly at their forward ends to form front bars, the lower ends of said front bars forming a lower forward support, and said side bars also bent rearwardly and obliquely, and handle-bars secured to the rearwardly and obliquely extending portions of the side bars, and projecting rearwardly beyond the same to form rear steps.

604,046. HEAT-ECONOMIZER. JOHN C. HENDERSON, New York, N. Y. Filed June 28, 1895. Serial No. 554,204. (No model.)

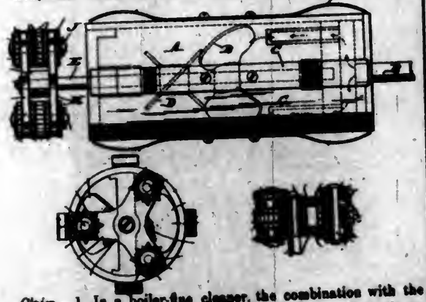
Claim.—1. In a heating system, the combination with the source of heat, the absorber or heater, having manifolds, upper and lower, arranged parallel with each other, and within the flue of the uptake, and communicating with each other, adapted to be acted on by the said heat, the circulating system, substantially as herein shown and described, and connected with said heater, for carrying a heating medium, as oil, and pumps for circulating the said medium through the system, and through the heater or absorber, as herein set forth.

2. In a heating system, the combination with the source of heat, the absorber or heater, provided with series of upper and lower manifolds, located and arranged within the flue of the uptake, in different planes, but parallel with each other, connected together, and communicating with each other, and adapted to be acted on by the said heat, the circulating system connected to, and communicating therewith, and adapted to keep in a continuous circulation a heating medium, such as oil, the intake of said heater or absorber, situated at the point of lowest heat, and the output at the point of highest heat, substantially as herein shown and described.

3. In a heating system, the combination with a furnace, of the uptake thereof, of the heater or absorber, consisting of the two series of upper and lower manifolds, connected together, and communicating with each other, by the series of tubes or sections, the series of tubes, *c*, having one end of each of said tubes opening into the upper manifolds, and the other end thereof, opening into the lower manifold, the circulating system, adapted to carry on continuous cycles of a circulating medium, through the said system and absorber, and means for circulating said medium, substantially as herein shown and described.

4. In a heating system, the combination of the heater or absorber, provided with two manifolds connected together, and communicating with each other, the series of sections or tubes, *c*, each of said manifolds having perforated branch pipes, located therein, the circulating system, adapted to keep in continuous circulation a heating medium, the receiver or melting-pan, pipes connected to, and communicating with, both sides of the said system, for conducting the heating medium to and from the receiver-jackets, reheaters, or melting pans, substantially as herein shown and described.

5. In a heating system the combination of the intake and output, of the heater or absorber, comprising two series of manifolds, an upper and a lower series, located and arranged within the flue of an uptake, in different planes, one above the other, and connected together and communicating with each other by means of a series of tubes, one or more of said manifolds connected to and communicating with the intake, and one or more of said manifolds connected to and communicating with the output, substantially as herein shown and described.



6. The combination with the intake and the output, of a heater or absorber, consisting of two series of manifolds, tubes connecting together, and forming communication between said series of manifolds, the plurality of inclined perforated pipes, connecting together and forming communication between one of said series of manifolds, and the intake, and valves for said pipes, substantially as herein shown and described.

7. In a heating system, the combination of the intake and the output, the heater or absorber, substantially as herein shown and de-

scribed, the circulating system, for carrying on continuous cycles of a heating medium, such as oil, the gas and steam relief, upon the outlet, and the drip and water tank, upon the intake, as herein set forth.

8. In a heating system, the combination with the source of heat, of the absorber or heater, having two series of manifolds, an upper and lower connected together, and communicating with each other, the series of sections or tubes, *c*, communicating with the said manifolds respectively and each of said manifolds, provided with perforated branch pipes, and regulating-valves, the circulating system connected therewith, and adapted to keep in a continuous circulation a heating medium, such as oil, the intake of said heater or absorber, situated at the point of lowest heat, and the output at the point of highest heat, substantially as herein shown and described.

604,047. **BOILER-FLUE CLEANER.** HENRY L. HILDRETH, Saginaw, Mich. Filed July 10, 1897. Serial No. 644,080. (No model.)

Claim.—1. In a boiler-flue cleaner, the combination with the hollow head and rotary propeller-shaft mounted therein, of a frame carried upon and rotating with the propeller-shaft, and an independent freely-rotatable scale-cutter having its axis parallel to the propeller-shaft and mounted on the frame in slotted bearings located to one side of the axis of rotation of the frame so as to move outward under the action of centrifugal force when the propeller-shaft rotates and produce a rolling frictional cutting-contact with the scale upon the interior of the tube.

2. In a boiler-flue cleaner, the combination with the hollow head and rotary propeller-shaft mounted therein, of a frame carried by and rotating with the propeller-shaft and having near its outer edges more or less radially-slotted bearings, a movable shaft arranged parallel to the propeller-shaft and movable in the slotted bearings, and a toothed cutting-disk carried by said shaft and movable with it in the frame.

3. In a boiler-flue cleaner, the combination with the hollow head and rotary propeller shaft mounted therein, of a frame having parallel arms carried by and rotating with the propeller-shaft and in which the arms are each provided with a slot more or less radially disposed to the propeller-shaft, a shaft loosely mounted in the slots of the arms of the frame and thereby movable in a more or less radial direction, and a series of loose toothed cutting-disks carried by said shaft whereby said disks rotate upon their own axis while being movable more or less radially and bodily moved about the shaft.

4. In a boiler-flue cleaner, the combination with the hollow head and rotary propeller-shaft mounted therein, of a frame carried by and rotating with the propeller-shaft, and a series of scale-cutters carried by the frame out of alinement with the shaft but in substantially the same plane with each other and each consisting of a series of toothed disks mounted upon the same axis in which the line of separation between adjacent faces of the disks of one scale-cutter are out of the plane in which the corresponding line of separation occurs between the disks in the others whereby one set of cutters is moved bodily over the path traversed by the others and every portion of the scale subjected to the action of the cutters.

5. In a boiler-flue cleaner, the combination with the hollow head and rotary propeller-shaft mounted therein, of a frame carried by the propeller and having two parallel slotted arms, a shaft journaled in said slotted arms and adapted to move outward in said slots under the action of centrifugal force when the propeller-shaft rotates, and a scale-cutter having a toothed periphery loosely carried by said shaft intermediate of the slotted arms.

6. In a boiler-flue cleaner, the combination with the head and rotary propeller-shaft, of a frame carried by the propeller-shaft and having two parallel slotted arms, a shaft journaled in said slotted arms and adapted to move outward in the slots thereof under the action of centrifugal force when the propeller-shaft rotates, a series of independent toothed disks, arranged side by side, and a shaft guided loosely in the slotted arms and supporting the disks between said arms.

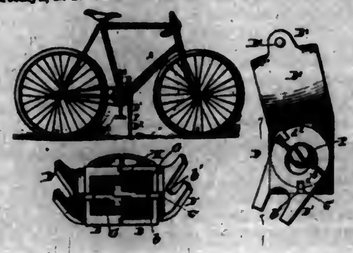
7. In a boiler-flue cleaner, the combination with the head and rotary propeller-shaft, of a frame carried by the propeller-shaft and having two parallel slotted arms, a shaft journaled in said slotted arms and adapted to move outward in the slots thereof under the action of centrifugal force when the propeller-shaft rotates, and a series of independent toothed disks mounted on the shaft between the slotted arms and one or more additional toothed disks on the axis outside of the slotted arms.

8. In a boiler-flue cleaner, the combination with the head and rotary propeller-shaft, of a frame carried by the propeller-shaft and having a series of pairs of parallel slotted arms, a shaft journaled in each pair of parallel slotted arms and independently adapted to move outward in the slots thereof under the action of centrifugal force when the propeller-shaft rotates, and a series of independent and loosely-rotatable toothed disks mounted on each shaft between the slotted arms.

9. In a boiler-tube cleaner, the combination with the hollow head and a rotary propeller and shaft journaled therein, of a frame secured to and rotating with the propeller-shaft and having one or more pairs of laterally-projecting parallel arms each of which is provided with a slot arranged obliquely to a radial plane through the propeller-shaft, a movable shaft or pin loosely supported within the slots of the arms so as to be capable of moving at each end to different degrees, and rotary cutting-disks loosely supported upon the shaft or pin intermediate of the two parallel arms.

604,048. **NECKTIE-FASTENER.** BUCKLEY H. HOLMES, Duluth, Minn. Filed Aug. 12, 1896. Serial No. 602,669. (No model.)

Claim.—1. The herein-described improved necktie-fastener, the same being formed of a single piece of spring-wire and comprising at its upper end an attaching-loop, below which is formed a button-embracing eye, and below the eye divergent terminals abruptly ending in hooks adapted to engage the lower edge of the collar at opposite sides of the button or stud, substantially as specified.



2. The herein-described improved necktie-fastener, the same being formed of a single piece of spring-wire bent at opposite sides of its center to form the central triangular loop, 1, comprising the upper horizontal cross-bar 2, and below said loop having its terminals crossed and curved in reverse directions to form the button-embracing eye, 3, below which said terminals are diverged, as at 4, and laterally offset in rear of the plane of the loop and eye, and finally terminating in the rounded offset hooks, 6, adapted to engage the lower edge of a collar, substantially as specified.

604,049. **OXYDIAMIDODIPHENYL AND PROCESS OF MAKING SAME.** PAUL JACOBSON and HERMANN TROSIN, Berlin, Germany, assignors to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed Nov. 13, 1897. Serial No. 658,462. (No specimens.) Patented in Germany July 12, 1896, No. 90,980, and in France Aug. 7, 1896, No. 258,735.

Claim.—1. The process of producing oxydiamidodiphenyl bases by reducing the acetyl derivatives of oxyazo compounds such as paraoxyazobenzene by means of chlorid of tin and muriatic acid substantially as described.

2. The oxydiamidodiphenyl having the constitution $OH.NH_2—C_6H_3—C_6H_3NH_2$ which is a colorless substance melting at 148° centigrade easily soluble in alcohol, glacial acetic acid and hot water, more difficultly soluble in benzene, soluble in soda-lye being easily oxidized in alkaline solution substantially as described.

604,050. **BICYCLE SUPPORT AND LOCK.** WHITFIELD R. JONES, Brooklyn, N. Y. Filed Feb. 11, 1897. Serial No. 622,908. (No model.)

Claim.—1. In a combined stand and lock for cycles, having a housing-clamp provided with a key-opening and inclined sides and adapted for embracing the lower horizontal frame-bar, and locking mechanism within the housing including dogs G' G', the combination therewith of legs pivoted on the inclined sides to diverge when vertical and converge when horizontal, and a key for simultaneously operating the dogs for causing them to positively engage and lock both legs in either of the said two positions, substantially as specified.

2. In a combined stand and lock for cycles, having sections B B, pivotally connected, and constituting in connection with a screw B^4, a clamp and housing, the latter having inclined divergent sides and a key-opening, and the former adapted for embracing the lower horizontal frame-bar, the combination therewith of legs pivotally turning on the inclined sides of the housing to spread and converge, and key-operated locking mechanism within the same for simultaneously and positively engaging and locking both legs in either of said two positions, substantially as specified.

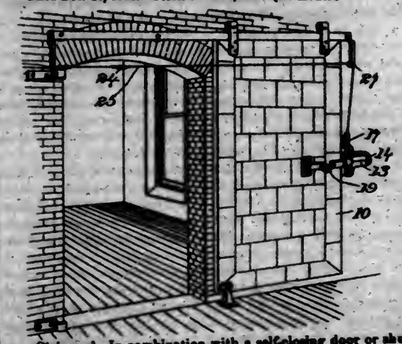
3. In a combined stand and lock for cycles, having the sections B B, pivotally connected and recessed at their lower portions and constituting the clamp and housing, the latter having the key-opening and the former adapted for embracing the lower horizontal frame-bar, the combination therewith of circular heads D D, pivotally turning on the sides and each provided with two or more recesses d^3, d^3, and offset legs, and a key-operated locking mechanism including the dogs G G, oppositely projecting through the housing-recesses and arranged to positively engage the same and lock the legs in either of two positions, substantially as specified.

604,051. **SHOE-BUFFER.** WILLIAM B. KNEELAND, Vineland, N. J. Filed Nov. 20, 1897. Serial No. 659,559. (No model.)

Claim.—1. A buffer consisting of a head, a conical cup attached thereto, a block supported within said cup, a conical-shaped pad in contact with said block, the latter and said head having a threaded passage therein, an exteriorly-threaded sleeve engaging the passage in said block, and a threaded bolt engaging the passage in said head, said sleeve having a head or washer thereon, in combination with suitable abrading material held on the side and base of said pad.

2. A buffer consisting of a conical pad, a block against which the same is held, a sleeve attached to said block, means for holding said pad in position relative to said block, an abrading device covering said pad, and means for holding said abrading device in position.

3. In a buffer, a conical cup, a conical block adapted to rest therein, a conical pad forming a continuation of said block, means for holding said pad on said block, and means for holding said block in position in said cup, in combination with suitable abrading material secured to said pad.



4. A buffer consisting of a pad, a block against which the same is held, a sleeve engaging said block, a lock-nut adapted to engage said sleeve, means for locking the latter, an abrading device covering said pad, and means for holding said abrading device in position.

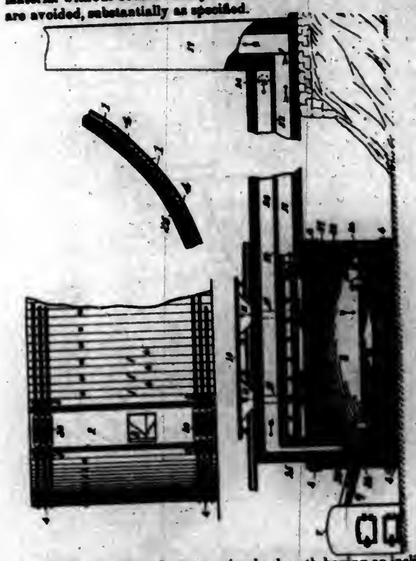
604,052. **HEATING FEED-WATER AND CIRCULATION.** JOHN KING, London, England. Filed July 12, 1897. Serial No. 643,695. (No model.)

Claim.—1. The combination, with a boiler provided with an internal fire-box; of hollow bars at the back and front of the lower part of the fire-box, a hollow inclined deflector in the upper part of the fire-box, a hollow partition connecting the said hollow bars and deflector, a water-pipe connection between the upper part of the deflector and the interior of the boiler, and a water-inlet pipe connected to one of the said hollow bars, substantially as set forth.

2. The combination, with a boiler provided with an internal fire-box; of hollow bars at the back and front of the lower part of the fire-box, an inclined hollow deflector in the upper part of the fire-box, a hollow partition connecting the said hollow bars and deflector, and separate water-pipe connections between the upper and lower parts of the said deflector and the interior of the boiler, substantially as set forth.

604,053. **SHUTTER-FASTENER.** JOHN G. LAMB, Philadelphia, Pa. Filed Feb. 17, 1898. Serial No. 670,896. (No model.)

Claim.—1. In combination with a self-closing door or shutter, a fusible link, a cord, a slotted weight supported by said cord, a pivoted arm located in the slot of the weight, and a latch.



2. In a fastener for self-closing doors or shutters, the combination of a pivoted arm, a weight which normally supports said arm but impinges upon it in falling, and a latch.

604,054. **SMELTING-FURNACE.** HERBERT LAMB, Oakland, Cal. Filed Feb. 18, 1897. Serial No. 624,068. (No model.)

Claim.—1. In a smelting-furnace, a circular hearth having an inclined or sloping margin, a circular arch over the said hearth, dome-shaped within and flat without, said dome meeting the sloping margin of the said hearth at an acute angle, a series of vertical stays surrounding the structure and supporting the arch, and elastic encircling bands with means for adjusting the same, in combination with means for supplying heat and suitable flues for carrying off the waste products of combustion and for supplying air, substantially as specified.

2. In a smelting-furnace, a circular hearth having an inclined or sloping margin, a circular arch over the said hearth, dome-shaped within and flat without, said dome meeting the sloping margin of the said hearth at an acute angle, vertical stays surrounding the structure and supporting the arch, and elastic encircling bands surround-

ing the stays, said hearth and arch being formed of a homogeneous material without courses or layers, whereby joints in the structure are avoided, substantially as specified.

3. In a smelting-furnace, a circular hearth having an inclined or sloping margin, a circular arch over the said hearth, dome-shaped within and flat without, said dome meeting the sloping margin of the said hearth at an acute angle, vertical stays surrounding the structure and supporting the arch by means of brackets or ledges affixed to said stays, and elastic adjustable bands surrounding and supporting the stays, substantially as specified.

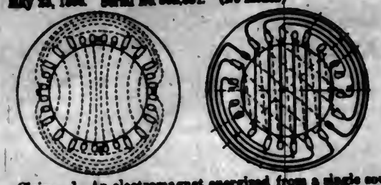
4. In a smelting-furnace, a circular hearth having an inclined or sloping margin, a circular arch over the hearth, dome-shaped within and flat without, said dome meeting the sloping margin of the said hearth at an acute angle, forming a furnace-chamber, a separate combustion-chamber, a conduit connecting the said combustion-chamber with the said furnace-chamber, a chimney-flue for carrying off the waste products of combustion, and passages from the furnace-chamber to the said chimney-flue, substantially as specified.

5. In a smelting-furnace, a circular homogeneous structure formed of molded refractory material, without joints, comprising a hearth having a sloping margin, an arch over said hearth, flat without, dome-shaped within, meeting said sloping margin at an acute angle, the whole surrounded by a series of vertical supporting-stays encircled by elastic metallic constraining-bands, substantially as specified.

6. In a smelting-furnace, a circular structure comprising a hearth having an inclined or sloping margin and an arch over the said hearth, dome-shaped within and flat without, forming a furnace-chamber, said dome meeting the sloping margin of the said hearth at an acute angle, an inlet-conduit for conveying hot products of combustion to said furnace-chamber, outlet-passages remote from said conduit for waste products of combustion, a conduit with a double flue passing over the top of the structure, one flue for the waste products of combustion and the other for the admission of air to the furnace-chamber, and downtake-passages 25 through the arch near the margin thereof, substantially as specified.

7. In a smelting-furnace, a circular structure comprising a hearth and an arch over the said hearth, dome-shaped within and flat without, forming a furnace-chamber, an inlet-conduit for conveying hot products of combustion to said furnace-chamber, an inlet-passage for heated air near said conduit, outlet-passages remote from said conduit, for waste products of combustion, a chimney-flue, and a horizontal conduit over the top of the structure, separated by a horizontal diaphragm into upper and lower flues, one for the conveyance of the waste products of combustion and the other for the conveyance of heated air to the furnace-chamber, substantially as specified.

8. In a smelting-furnace, a circular structure comprising a hearth, and an arch over the said hearth, dome-shaped within and flat without, forming a furnace-chamber, outlet-passages at one side of the said furnace-chamber, an inlet-passage at the other side of the said chamber, a chimney-flue, a double conduit over the structure comprising two horizontal flues, one above the other, the lower flue connecting the furnace-chamber by the said outlet-passages with the chimney-flue, the upper flue communicating with the external air at one end, and with the furnace-chamber at the other end by the said inlet-passage, and means for supplying the said furnace-chamber with ore in suitable quantities at various points, substantially as specified.



9. In a smelting-furnace, a circular homogeneous structure formed of molded refractory plastic material, comprising a hearth and an arch over the said hearth, dome-shaped within and flat without, said hearth having an inclined or sloping margin, and meeting said dome at the joining-line at an acute angle supported entirely from the outside by means of vertical stays and supporting-brackets affixed thereto, and encircling adjustable elastic bands, in combination with an inlet-conduit for products of combustion, an inlet-passage for hot air, inlet-conduits for supplying ore, outlet-passages for waste products of combustion, and a chimney-flue, substantially as specified.

10. In a smelting-furnace, a circular hearth, a circular arch over the said hearth, dome-shaped within and flat without, forming a furnace-chamber, a combustion-chamber, a conduit connecting the said combustion-chamber with the said furnace-chamber, an inlet-passage for hot air near the said conduit, inlet-conduits and hoppers for supplying ore, outlet-passages for waste products of combustion, a chimney-flue, a horizontal conduit along the top of the structure, comprising two flues one above the other, the upper flue communicating with the external air at one end and with the chimney-flue at the other end, and openings in the periphery of the furnace-chamber, substantially as specified.

11. In a smelting-furnace, a chamber provided with a dome-shaped roof or arch 27, a separate combustion-chamber 7, with downwardly-inclined conduit 9 for conveying hot products of combustion to the said furnace-chamber, and vertical passages 25 in said arch 27 near the conduit 9, whereby the burning gases are thrown down upon the hearth, substantially as specified.

604,055. ELECTROMAGNET HAVING ROTATING FIELDS.

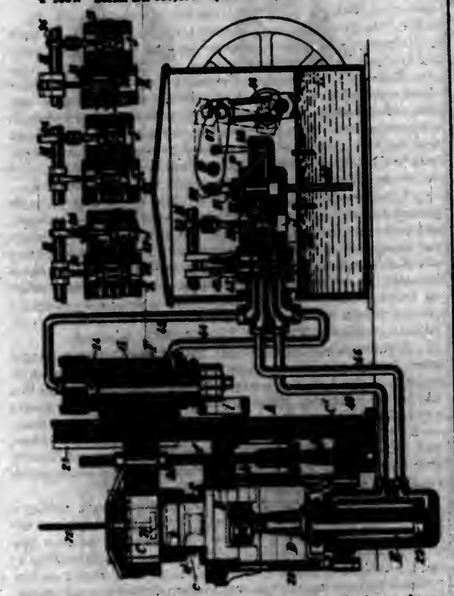
WALTER LARSON-DAVIES, London, England, assignor, by mesne assignments, to the Davies Motor Company, Limited, same place. Filed May 23, 1896. Serial No. 592,851. (No model.)

Claim.—1. An electromagnet energized from a single source of alternating electromotive force comprising two component fields of equal rates of alternation but with different phase angles of magnetization, having their magnetic axes inclined one to the other at an angle other than ninety degrees and equal to the supplement of that angle by which the currents in the two component windings differ in phase, thus producing a rotary field.

2. An electromagnet energized from a single source of alternating electromotive force, for an electric motor or transformer, comprising two component fields of equal strength and equal rates of alternation, but with different phase angles of magnetization, having their magnetic axes inclined one to the other at an angle other than ninety degrees and equal to the supplement of that angle by which the currents in the two component windings differ in phase, so as to produce a resulting rotary field of constant strength and of uniform rate of rotation.

3. A field-magnet for an electric motor or transformer, consisting of a substantially cylindrical magnetic core, wound with coils of wire encircling varying amounts of the cylindrical field-space, the coils being distributed upon the cylinder in due proportion to the magnetic reluctance to be overcome in the central field-space, so as to produce a field of substantially uniform density, substantially as described.

4. A field-magnet for electric motors or transformers consisting of a substantially cylindrical magnetic core, wound with two component windings, with their axes of magnetization inclined one to the other, each winding being composed of coils of wire encircling varying amounts of the cylindrical field-space, the coils being distributed upon the cylinder in due proportion to the magnetic reluctance to be overcome in the central field-space, so as to produce a resultant field of substantially uniform density, substantially as described.



5. A field-magnet for electric motors or transformers, consisting of a substantially cylindrical magnetic core, wound with two component windings, carrying currents of different phase, the magnetic axes of the two component fields being inclined one to the other, each winding being composed of coils of wire encircling varying amounts of the cylindrical field-space, the coils being distributed upon the cylinder in due proportion to the magnetic reluctance of the central field-space, so as to produce a rotary field of substantially uniform density, substantially as described.

6. A field-magnet for electric motors or transformers consisting of a substantially cylindrical magnetic core, wound with two component windings, carrying currents of equal magnetizing effects and rate of alternation but of different angles of lag, the magnetic axes of the two component fields being inclined one to the other at an angle equal to the supplement of that angle by which the currents in the component windings differ in phase, each winding being composed of coils of wire encircling varying amounts of the cylindrical field-space, the coils being distributed upon the cylinder in due proportion to the magnetic reluctance to be overcome in the central field-space, so as to produce a resultant rotary field of uniform density, constant strength, and uniform rate of rotation.

7. An electromagnet having a rotating field resulting from two windings carrying currents differing in phase asymmetrically arranged upon the core and inclined the one to the other at an oblique angle which is the supplement of the angle by which the current in the two windings differ in phase.

604,056. HYDRAULIC PRESS.

FRANK M. LEAVITT, Brooklyn, N. Y., assignor to the E. W. Bliss Company, same place. Filed June 4, 1897. Serial No. 639,413. (No model.)

Claim.—1. In a press having two hydraulic cylinders and rams, the combination therewith of a controlling-valve and communicating passages adapted in one position of said valve to connect the eduction side of one cylinder with the induction side of the other, whereby movement of the ram of the former acts through the intervening hydraulic column to move the ram of the latter, and simultaneous movement of the two rams is insured.

2. In a drawing-press having two hydraulic cylinders and rams, the one for working the blank-holder and the other the punch, the combination therewith of a controlling-valve and communicating passages adapted in one position of said valve to connect the eduction side of one cylinder with the induction side of the other, whereby movement of the ram of the former acts through the intervening hydraulic column to move the ram of the latter, thereby insuring simultaneous retracting movements of the punch and blank-holder.

3. In a drawing-press having two hydraulic cylinders and rams, the one for working the blank-holder and the other the punch, the combination therewith of a controller comprising a distributing-valve and passages communicating therefrom with the opposite ends of the respective cylinders, and a stop-valve adapted in one position to direct the liquid from the pump to the distributer, and in another position to direct the liquid therefrom when the press is to remain at rest.

4. In a hydraulic press, the combination with its cylinder, ram, and distributer-valve controlling the flow of liquid to the cylinder, of a valve-operating mechanism comprising a continuously-driven part, a clutch interposed between such part and the valve and adapted when engaged to communicate movement to the valve, means for disengaging said clutch at the end of determinate movements thereof, and tappet mechanism operated by the ram and connected to the clutch-disengaging means to reëngage the clutch at the end of determinate movements of the ram.

5. In a drawing-press having two hydraulic cylinders and rams, the one for working the blank-holder and the other the punch, the combination therewith of a distributer-valve for controlling the flow of liquid to the respective cylinders, and means for operating said valve comprising a continuously-driven part, a clutch interposed between it and the valve, clutch-operating dogs in positions corresponding to the stopping positions of the valve, and tappet mechanisms operated by the rams and connected to the respective dogs, whereby the shifting of the valve from one position to the next is controlled by the ram movements and is effected by power derived from said continuously-driven part.

6. In a hydraulic press, the combination with a cylinder and ram, the latter tending by gravity to move in one direction, of a distributer for controlling the flow to said cylinder, a valve-opening with the exhaust therefrom during the gravitating movement of said ram, and an adjustable tension device opposing the opening of said valve, whereby the gravitating movement is opposed by said valve proportionally to the tension thereon.

7. In a hydraulic press the combination of a hydraulic cylinder, ram, and platen, the ram and platen connected together so that the weight of the platen tends to move the ram in one direction, a distributer controlling the flow of liquid to said cylinder, and a valve having a spring holding it normally closed, and arranged to close the outlet from the distributer through which the liquid from said cylinder must escape during the gravitating movement of the ram, whereby the gravitation of the platen is opposed by the choking of the outflow of liquid by said valve proportionally to the compression of its spring, and the gravitating movement is thereby moderated.

8. In a hydraulic drawing-press, the combination of two cylinders and rams, of controlling means interposed between the source of hydraulic pressure and said cylinders, comprising a stop-valve J and a distributer K, and means for operating them comprising a shaft M having a crank connected to said distributer, and a cam adapted in one stopping position to displace said stop-valve, and means for rotating said shaft a quarter-turn at each movement.

9. In a hydraulic press, the combination with its cylinder, ram, and pump, of a valve movable to admit the flow from the pump to the cylinder, or to waste it freely back to the pump, and means for moving it to intermediate positions to choke more or less the waste and thereby to control the speed of the ram, and an adjustable stop device adapted to vary the extent of its opening.

10. In a hydraulic press, the combination with its cylinder, ram, and pump, of a stop-valve J controlling inlet-port 27 and outlet-port 29 and having its piston 28 of less effective width than the width of the port 27, whereby in an intermediate position it opens this port partly to the waste and partly to the outlet-port 29 supplying the cylinder.

604,057. MACHINE FOR WORKING SHEET METAL.

FRANK M. LEAVITT, Brooklyn, N. Y., assignor to the E. W. Bliss Company, same place. Filed June 28, 1897. Serial No. 643,794. (No model.)

Claim.—1. The combination of a supporting-frame adapted to rest on a horizontal support and formed with inclined spindle-bearings, inclined spindles in said bearings, reciprocal rotary dies on the lower ends of said spindles, inclined mechanism mounted on said frame for automatically feeding the blank by an oblique upward movement onto one of said dies, and automatic mechanism for subsequently moving the dies together to act on the blank, and then separating them to release the blank, whereby the latter is discharged by gravity.

2. The combination of a stationary supporting-frame having non-

rotative spindle-bearings, rotary spindles in said bearings carrying reciprocal rotary dies on their lower ends, a pad beneath the master-die, adapted to feed the blank onto the latter, and to hold it thereon during the operation, and positively-acting cam mechanisms for first advancing said pad, then moving the dies together to act on the blank while the latter is held by the stationary pad, and finally separating the dies and retracting the pad to permit the discharge of the blank by gravity.

3. The combination of a supporting-frame having stationary spindle-bearings, rotary spindles F G therein carrying reciprocal dies *f g*, a pad Q, a reciprocating plunger Q′ therefor, a revolving cam R for reciprocating said plunger with a positive movement in both directions, one of said spindles being mounted to be movable toward and from the other, a revolving cam and connecting mechanism for so moving it, and driving mechanism for said spindles and cams adapted to turn the cams coincidently to the effect specified.

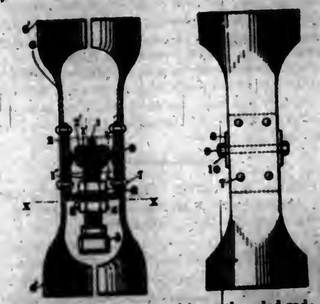
4. The combination of rotary spindles F G carrying reciprocal dies *f g*, a revolving gear D, pinions on said spindles, one of them meshing directly with said gear, and an idler-pinion for connecting the other to said gear, a swing-frame carrying one of said spindles and turning on the same axis as said gear D, and a cam for moving said swing-frame to bring the spindles and dies toward and from each other.

5. The combination of rotary spindles F G carrying reciprocal dies, and provided with pinions, a gear D driving said pinions, a swing-frame H carrying one of said spindles and turning on the same axis as said gear, a cam I rotating with said gear, and a lever J driven by said cam and mechanically connected with said swing-frame for communicating the movement imparted by said cam to move the dies toward and from each other.

6. The combination of rotary spindles F G carrying reciprocal dies, and provided with pinions, a gear D driving said pinions, a swing-frame H carrying one of said spindles and turning on the same axis as said gear, a cam I rotating with said gear, a lever J driven by said cam, a link *k* connecting said lever with the swing-frame, and an adjustable block *k* for varying said connection, whereby to adjust the relative approach of the dies.

7. The combination of reciprocal rotary dies, a pad adapted to feed the blank onto the master-die, and an automatic feed for the blanks comprising a trough down which they may gravitate, and a laterally-reciprocating feeder at the bottom of said trough having a recess adapted to receive one blank at a time, and movable to carry said blank onto said pad, and having a lateral extension adapted when so moved to receive the next gravitating blank and form a temporary bottom for the trough until the return movement of said feeder.

8. The combination of a main supporting-frame having stationary inclined spindle-bearings, rotary spindles in said bearings carrying reciprocal rotary dies on their lower ends, a pad beneath the master-die, movable obliquely upward in direction approximately parallel to the axis of said die, to feed the blank onto said die, and mechanism for feeding the blanks into position between said pad and die, comprising an inclined trough down which the blanks may gravitate, in a plane approximately perpendicular to the axis of said die, and a reciprocating feeder at the bottom of said trough having a recess to receive the lowermost blank, movable laterally to deliver it onto said pad, and having means for preventing the fall of the blanks to the bottom of the trough until the return movement of the blank, with automatic driving mechanism for alternately moving said feeder and pad to the effect specified.



9. A blank-feed mechanism comprising an inclined trough L down which the blanks may gravitate, a feeder M at the bottom of said trough having a recess to receive the lowermost blank, movable laterally to deliver said blank out of the trough, and having an extension *m′* to arrest the next blank and hold it until the return movement, and a finger P adapted to engage the next to the lowermost blank and hold it off said feeder, with means for lifting said finger at each movement of the feeder to drop the blanks against said extension.

10. A blank-feed mechanism comprising an inclined trough L down which the blanks may gravitate, and a feeder M at the bottom of said trough having a recess to receive the lowermost blank, movable laterally to deliver said blank out of the trough, and having an extension *m′* to arrest the next blank and hold it until the return movement, and a finger P adapted to engage the next to the lowermost blank and hold it off said feeder, a shaft P′ carrying said finger, a cam-arm on said shaft, and a cam projection on said feeder adapted to coact with said cam-arm to oscillate said shaft and lift said finger at each feed movement of the feeder.

11. The combination of reciprocal rotary dies, spindles F G carrying them and having pinions, gear D driving said pinions, feed-trough L, feeder M formed as a swinging arm carried on a shaft *m*, and a cam N terming with said gear D and mechanically connected to said feeder-arm for vibrating the same at intervals, whereby to carry a blank from the bottom of said trough into alinement with one of said dies.

12. The combination of rotary spindles F G carrying reciprocal dies, means for revolving them, a fixed frame carrying one spindle, a swing-frame carrying the other, and guide-plates for insuring accurate coincidence of the dies, fixed to said frames adjacent to the bearings for said spindles, the one formed with a projection entering a recess in the other.

604,058. FLUE-SCRAPER. RICHARD I. LOCKE and OSCAR H. SCHMIDT, Chicago, Ill. Filed Aug. 27, 1897. Serial No. 649,726. (No model.)

Claim.—1. A flue-scraper comprising a threaded rod; a pair of shanks pivoted thereto; each shank having a scraping edge on each end, and each shank having a shoulder 2″ projecting toward said rod; a nut on said rod above said shoulders and a nut on said rod below said shoulders; said nuts being adapted to bind against said shoulders and thereby limit the degree of separation of the scraping edges on corresponding ends of the shanks; substantially as described.

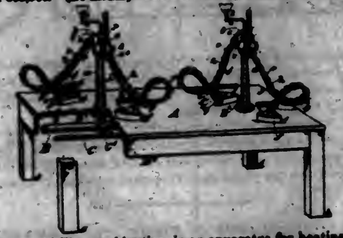
2. A flue-scraper comprising a threaded rod; a pair of shanks pivoted thereto; each shank having a scraping edge on each end, and each shank having a shoulder 2″ projecting toward said rod; a nut on said rod above said shoulders and a nut on said rod below said shoulders; said nuts being adapted to bind against said shoulders and thereby limit the degree of separation of the scraping edges on corresponding ends of the shanks; and a connecting member 8 pivoted to each shank on a different axis than the pivoted axis between each shank and the rod; substantially as described.

3. A flue-scraper, comprising a pair of shanks, each having a scraping edge on each end; a lug 2′ and a shoulder 2″ projecting inwardly from each shank; a member 1, adapted for attachment to a handle, having sockets 1′ therein for receiving the lugs, and having a threaded shank, extending between said shoulders, with a nut thereon above said shoulders, and a nut thereon below said shoulders; said nuts being adapted to bind against said shoulders and thereby limit the degree of separation of the scraping edges on corresponding ends of the shanks, substantially as described.

4. A flue-scraper comprising a pair of shanks, each having a scraping edge on each end; a member 2, having the lug 2′ and the shoulder 2″ projecting inwardly therefrom, secured to the inner face of each shank; a connecting member 8 pivoted to each member 2; and a member 1 adapted for attachment to a handle, having sockets 1′ therein for receiving the lugs, and having a threaded shank extending between said shoulders with a nut thereon above said shoulders, and a nut thereon below said shoulders; said nuts being adapted to bind against said shoulders and thereby limit the degree of separation of the scraping edges on corresponding ends of the shanks, substantially as described.

604,059. CHURN. JOHN A. MADDOX, West Union, Ohio, assignor to C. C. MOORE, same place. Filed July 7, 1897. Serial No. 643,748. (No model.)

Claim.—1. In a churn, the combination with a receptacle and dasher, of a swinging standard adapted for movement toward and from the plane of the dasher-staff, a slide or cross-head mounted for reciprocation upon the standard and forked or bifurcated to engage the dasher-staff between spaced shoulders, and operating devices mounted upon the standard for reciprocating the slide, substantially as specified.

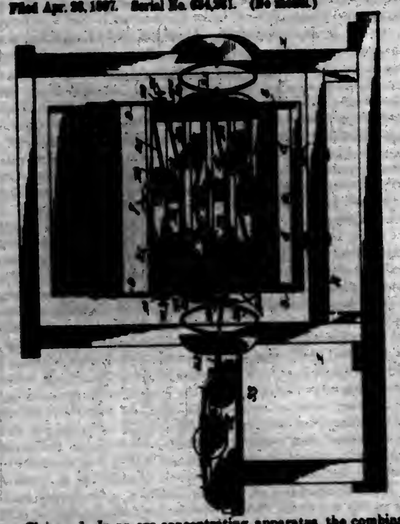


2. In a churn, the combination with a receptacle and dasher, of a swinging standard mounted upon the receptacle for movement toward and from the plane of the dasher-staff, a keeper on the receptacle for receiving and engaging the standard when in its normal or upright position, a slide or cross-head mounted for reciprocation upon the standard and bifurcated to engage the dasher-staff between spaced shoulders, and operating devices mounted upon the standard for actuating the slide, substantially as specified.

3. An attachment for churns comprising a standard, a securing-plate to which the standard is hingedly connected, said securing-plate being adapted to be fastened to the side of a churn-receptacle, a slide or cross-head mounted for reciprocation upon the standard and adapted to extend inwardly over the top of the churn-receptacle, said slide or cross-head terminating in a fork or bifurcation for engagement with a dasher-staff between spaced shoulders thereon, and operating devices mounted upon the standard for reciprocating the slide, substantially as specified.

4. A dasher-operating mechanism having a standard, a slide or cross-head mounted for reciprocation upon the standard and adapted to be engaged with a dasher-staff, a crank-shaft and means for operating the same, and a pitman pivotally mounted at one end upon the slide or cross-head, and bifurcated at the other end to form spaced yielding jaws between which the interval is less than the spindle portion of the crank, and also provided, in communication with the interval between the jaws, with a bearing for said spindle portion of the crank, substantially as specified.

604,060. SMOOTHING AND PRESSING IRON. JOHN MANNERS and JAMES R. S. HAYES, London, England. Filed Dec. 24, 1897. Serial No. 663,906. (No model.) Patented in England Jan. 14, 1898, No. 664.



Claim.—1. The combination, in an apparatus for heating a combustion-chamber, of a gas-supply pipe, an air-supply pipe, means to supply air under pressure to such last-mentioned pipe, a box connected to said pipes, compartments in said box for gas, air and exhaust respectively, a regulating plug and valve connected to both the gas and air compartments, means to convey the mixed gas and air under pressure to the combustion-chamber and means to connect the combustion-chamber to the exhaust-compartment in said box.

2. In an apparatus for heating a combustion-chamber, the combination, with a box having compartments respectively for gas, air under pressure and exhaust, the air and gas chamber connecting through a mixing valve or regulator with the combustion-chamber which chamber is connected with the said exhaust-compartment, of a way or passage between said air and exhaust compartments serving to produce in the latter an induced air-current substantially as and for the purposes set forth.

3. The combination, in an apparatus for heating a combustion-chamber, of a box divided into compartments for gas, air under pressure and exhaust, means to connect and mix in the proportions desired the said gas and air under pressure and to convey such mixture to the combustion-chamber, means to connect the combustion-chamber to the exhaust-compartment and means to connect said gas-compartment direct to said combustion chamber for the purpose of providing a pilot-light in said last-mentioned chamber substantially as set forth.

604,061. ORE-CONCENTRATOR. WALTER H. MEWBURN, Flagstaff, Ariz., assignor of one-half to Ezra S. Gosney, same place. Filed Apr. 28, 1897. Serial No. 634,361. (No model.)

Claim.—1. In an ore-concentrating apparatus, the combination with a reciprocatory receptacle, and means for imparting motion thereto, of a tier of concentrating trays arranged within the receptacle, alternate trays having spaced terminal elevated outlets, from which the floor declines inwardly to a depressed central pocket and the intermediate trays having central elevated outlets from which the floors decline outwardly in both directions, substantially as specified.

2. In an ore-concentrating apparatus, the combination with a reciprocatory receptacle, and means for imparting motion thereto, of a tier of concentrating-trays arranged within the receptacle, alternate trays having spaced terminal elevated outlets from which flat floor-surfaces decline inwardly to a depressed center, and intermediate trays having elevated central outlets from which flat floor-surfaces decline in both directions to form depressed terminal pockets, substantially as specified.

3. In an ore-concentrating apparatus, the combination with a vibratory receptacle, and means for imparting motion thereto, of a tier of concentrating-trays arranged within the receptacle, the alternate trays having spaced terminal outlets from which the floor declines inwardly to form a central pocket, and having a central transverse dividing-partition, and the intermediate trays having elevated central outlets, arranged respectively over the depressed pockets of the alternate trays, the floors of the intermediate trays declining in both directions from their outlets to form terminal depressed pockets, substantially as specified.

4. In an ore-concentrating apparatus, the combination with a vibratory receptacle, and means for communicating motion thereto, of a tier of concentrating-trays arranged within the receptacle, the alternate trays having elevated terminal outlets from which the floor declines inwardly to form a central depressed pocket, and the intermediate trays having central elevated outlets from which the floor declines outwardly to form terminal depressed pockets, and distributing-guards spanning the depressed pockets of said alternate trays beneath the outlets of the intermediate trays, substantially as specified.

5. In an ore-concentrating apparatus, the combination with a vibratory receptacle, and means for communicating motion thereto, of a tier of concentrating-trays arranged within the receptacle, the alternate trays having elevated terminal outlets from which the floor declines inwardly to form a central depressed pocket, and the intermediate trays having central elevated outlets from which the floor declines outwardly to form terminal depressed pockets, and separate distributing-trays interposed between the alternate and intermediate trays, and having guards spanning the depressed pockets of the alternate trays beneath the outlets of the intermediate trays, substantially as specified.

6. In an ore-concentrating apparatus, the combination with a

vibratory receptacle, and means for communicating motion thereto, of a tier of concentrating-trays arranged within the receptacle, each tray having its bottom constructed to form duplicate oppositely-inclined plane surfaces with an outlet at the most elevated point of each inclined surface, and a distributing-tray interposed between each two concentrating-trays, and provided with a reticulated guard arranged under and spaced from each outlet of the superjacent concentrating-tray and free at one edge to discharge into the subjacent tray, substantially as specified.

7. In an ore concentrating apparatus, the combination with a vibratory receptacle and means for operating the same, of a tier of alternately-disposed main and auxiliary concentrating-trays having their discharge-openings disposed respectively in longitudinally-different vertical planes, the main concentrating-trays having terminal, and the auxiliary concentrating-trays central, elevated discharge-openings, transverse partitions arranged at the depressed portions of the main concentrating-trays between the discharge-openings thereof to form separated ore-receiving pockets, and distributing-trays arranged under the central discharge-openings of the auxiliary concentrating-trays, and hence over the dividing-partition of the subjacent main concentrating-trays to cover said pockets, substantially as specified.

8. In an ore-concentrating apparatus, the combination with a longitudinally-vibratory receptacle, and means for communicating motion thereto, of a tier of alternately-disposed main and auxiliary concentrating-trays having their discharge-openings disposed respectively in longitudinally-different vertical planes, the main concentrating-trays having terminal, and the auxiliary concentrating-trays central, elevated discharge-openings, transverse partitions arranged at the depressed portions of the main concentrating-trays between the discharge-openings thereof to form separate ore-receiving pockets, distributing-trays arranged under the central discharge-openings of the auxiliary trays and spanning the depressed pockets of the main concentrating-trays, and a second distributing-tray arranged above the uppermost main concentrating-tray and having its bottom provided with a central depressed perforate portion and upwardly and outwardly inclined imperforate portions, substantially as specified.

9. In an apparatus of the class described, an ore-concentrating tray having a skeleton frame, a taut flexible bottom provided with a depressed portion, an elevated discharge-opening, and an inclined plane portion rising from the plane of the depressed portion to the discharge-opening, and means for vibrating the tray in a direction transverse to the length of the discharge-opening, and parallel with the direction of inclination of the bottom, substantially as specified.

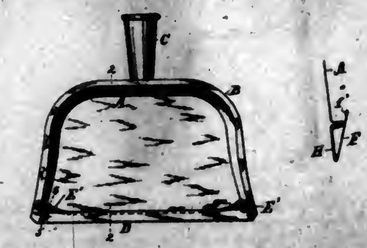
10. The herein-described ore-concentrating tray having a skeleton frame provided with sectional side bars, of which the lower members are cut away to form seats having a central depressed portion and contiguous upwardly-inclined side portions, and upper members having their lower edges constructed to fit said seats, and a flexible bottom of textile fabric interposed between the contiguous faces of said members of the side bars, and secured in place thereby, to correspond in cross-section with said seat, substantially as specified.

604,062. BOTTLE. FREDERICK L. MEYER, Brooklyn, N. Y. Filed Jan. 10, 1896. Serial No. 575,132. (No model.)

Claim.—1. As a new article of manufacture, a bottle provided with a recess on its shoulder, and a vent-tube connected with said recess and opening outward at its upper end, said vent-tube being integral with the walls of the bottle, substantially as set forth.

2. As a new article of manufacture, a bottle provided with a recess on its shoulder, a vent-tube connected at its upper end with said recess, and a seal for said recess, substantially as set forth.

3. As a new article of manufacture, a bottle provided with a recess on its shoulder, a vent-tube connected at its upper end with said recess, and a breakable seal for said recess, substantially as set forth.



604,063. SUPPOSITORY. ISAAC H. MILLER and JOSIAH R. MOSS, St. Joseph, Mo. Filed Sept. 20, 1897. Serial No. 652,262. (No model.)

Claim.—1. A suppository comprising the hard body formed of medicine or medicines, an anchor, and a flexible stem or shank interposed between the body and the anchor; the said stem or shank being formed of cord and having one end of said cord connected to the anchor and its opposite end frayed and embedded in the body, substantially as specified.

2. A suppository comprising the hard body formed of medicine or medicines, the anchor of general elliptical form and concavo-convex shape in cross-section made from rubber or other suitable material, and a stem or shank formed of cord and connected at one end to the anchor and having its opposite end frayed and embedded in the body, substantially as specified.

604,064. DUST-PAN. STEPHEN W. MILLIKAN, Brooklyn, N. Y. Filed Dec. 22, 1896. Serial No. 616,634. (No model.)

Claim.—1. A dust-pan provided adjacent to its front edge with the shoulder extended along such edge and inclined backwardly at its ends and a flange extended backwardly from the edge of the pan and projected over the shoulder excepting at its ends, to form a sharp corner along the middle portion of the shoulder, substantially as herein set forth.

2. A dust-pan provided along its front edge with the hem *f* and adjacent to the edge with the fold *h'* stamped upwardly from the bottom of the pan to form a shoulder parallel with the edge, and to stiffen the edge of the pan, and the separate flange F having the plate H formed integral therewith and provided with the tongue h fitted within the fold *h'*, and the inner edge of the flange F projected slightly beyond the shoulder formed by the fold, substantially as and for the purpose set forth.

604,065. FENCE-STAY. LEVI S. MOELLER, Covington, Ohio. Filed Feb. 21, 1898. Serial No. 671,181. (No model.)

Claim.—1. A fence-stay comprising parallel strips 1, the flat strip 2, and tie-wire 3 to draw and hold the outer edges of the parts 1 together, while the strip 2 braces the inner edges of said parts 1, substantially as shown and described.

2. A fence-stay comprising parallel strips 1 having their inner edges notched to engage the horizontal strand-wires of a fence, the strip 2 separating and bracing said notched edges, and tie-wires 3 to hold the outer edges of said parts 1 together, substantially as described.

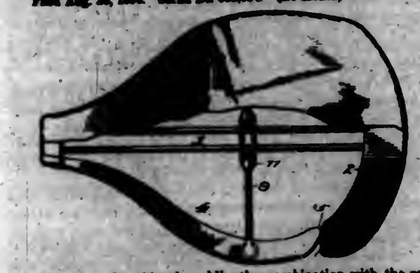
604,066. PROCESS OF MAKING PYROCATECHIN-SULFONIC ACID. PIERRE P. MONNET, Lyons, France, assignor to the Société Chimique des Usines du Rhône, Anotemennent Gilliard P. Monnet et Cartier, same place. Filed Nov. 22, 1897. Serial No. 659,518. (No specimens.) Patented in England July 6, 1896, No. 14,921, and in France Apr. 30, 1897, No. 266,498.

Claim.—1. The method or process hereinbefore described of producing or preparing meta-halogenated paraphenol-sulfonic acid, which consists in treating an acid solution of paraphenol-sulfonic acid with a halogen, and thereby halogenating such paraphenol-sulfonic acid, substantially as set forth.

2. The method or process hereinbefore described of producing or preparing pyrocatechin-monosulfonic acid which consists in melting an alkaline salt of meta-halogenated paraphenol-sulfonic acid with caustic alkali, substantially as set forth.

3. The method or process hereinbefore described of producing or preparing pyrocatechin-monosulfonic acid, which consists in first introducing a halogen into an acid solution of paraphenol-sulfonic acid, and thereby halogenating such paraphenol-sulfonic acid, then producing an alkaline salt of the halogenated product, and then melting the said salt with caustic alkali at a temperature not below about 250° centigrade, substantially as set forth.

604,067. ELASTIC TIRE AND MEANS FOR ATTACHING SAME. FRED W. MORGAN, Chicago, Ill., assignor to the Morgan & Wright, same place. Filed Mar. 16, 1896. Serial No. 574,127. (No model.)



Claim.—1. The combination with a vehicle-wheel having a channeled rim portion, of an elastic rubber or rubber-composition tire seated in the channeled rim and provided with an internally-arranged and longitudinally-extending thin flexible metal band having lapping ends, the band being secured at its lapping ends by one or more fastening devices which are inserted through one or more openings punched through the band and clamped down flat upon the band so as to permit end portions of the tire forced back upon the band to slide upon the joined ends of the band and close the one against the other, substantially as set forth.

2. An elastic rubber or rubber-composition tire molded upon a thin flexible band, and secured upon a channeled wheel-rim by fastening devices inserted through suitable openings punched in the band and flattened down upon the band so as to permit the end portions of the tire to slide over the end portions of the band thus secured together, substantially as described.

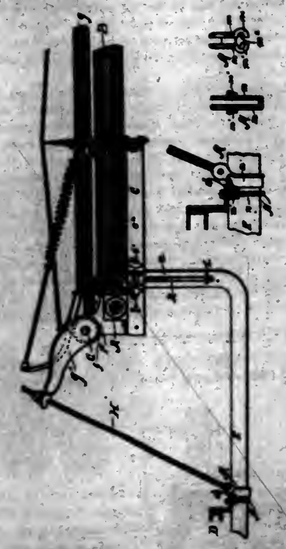
3. An elastic rubber or rubber-composition tire provided with an internally-arranged and longitudinally-extending thin metal or metallic-composition fastening-band and held seated in a channeled wheel-rim by the latter, the end portions of the fastening-band being lapped and provided with one or more openings and one or more pliable tongues, the latter being inserted through the former and clamped down upon the band, substantially as described.

4. An elastic rubber or rubber-composition tire molded upon a thin, pliable metal or metallic fastening-band and secured upon a wheel-rim by the latter, the end portions of the band being lapped together and provided with one or more openings and one or more pliable tongues, the latter being inserted through the former and clamped down upon the band, substantially as described.

604,068. BICYCLE-SADDLE. JOHN W. MORRAN, Harriman, Tenn. Filed Aug. 26, 1896. Serial No. 603,994. (No model.)

Claim.—1. In a bicycle-saddle, the combination with the usual longitudinal supporting-bar, of front and rear end sections secured respectively to the opposite ends thereof, a pair of oscillating wings rocking on substantially longitudinal axes, and located on opposite sides of the saddle, and a transverse rod connecting the wings together so that a downward pressure on one elevates the other, substantially as described.

2. In a bicycle-saddle, a frame provided with a pair of oscillating side wings having substantially longitudinal axes, in combination with means for adjusting the wings nearer together or farther apart, substantially as described.



3. In a bicycle-saddle, and in combination with the frame portion thereof, a pair of oscillating side wings having substantially longitudinal axes, and a connecting-bar having its opposite ends pivotally joined to the wings, whereby they are made to alternate, substantially as described.

4. In a bicycle-saddle, the combination with a supporting-frame having rigid sections attached to its front and rear ends, of a pair of oscillating side wings having longitudinal axes, and pivoted to said sections, and transverse rods attached to the wings by universal joints, substantially as described.

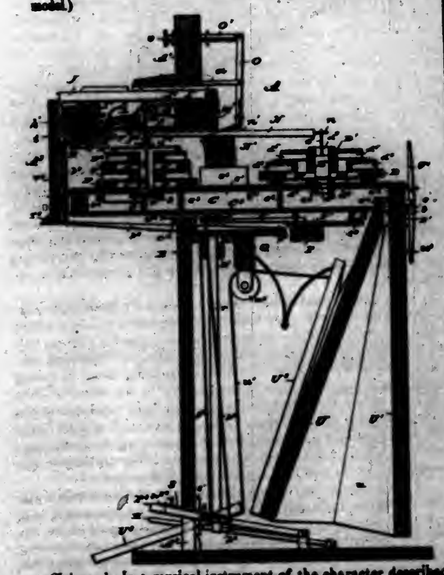
5. In a bicycle-saddle, the combination with the supporting-frame, of a pair of oscillating side wings having longitudinal axes and pivoted to said frame, and a transverse rod attached to the wings by a universal joint, substantially as described.

6. In a bicycle-saddle, the combination with the longitudinal frame portion provided at its opposite ends with rigid transverse sections, of a pair of curved side wings pivoted to rock or oscillate on said sections, and an adjustable connection between the wings, whereby the lowering of one wing lowers the other.

604,069. HEADER PLATFORM CONNECTION. JOHN MORRIS, West Pullman, Ill., assignor to the Plano Manufacturing Company, Chicago, Ill. Filed Feb. 9, 1895. Serial No. 537,932. (No model.)

Claim.—1. In a header-harvester, the axle, in combination with a stationary frame carried thereby, a bracket, I, provided with a channel, *i*, in one side, having suitable, outwardly-flaring edges, *i*², platform-supporting arms, E, provided with upright terminals, *e*, corresponding substantially in width to the narrowest part of the channel and adapted to fit loosely therein, and a hinge or pivot connecting device uniting the platform support and bracket, substantially as described.

2. In a header-harvester, a main or stationary frame, C, in combination with brackets, I, secured to the respective end bars of the frame and provided with a transverse channel, *i*, in one side and flaring at each end, and an enlargement or rib, *i*³, on its outer face, having a recess or socket therein, platform-supporting arms, E, having upright terminals, *e*, adapted to fit and move in the channels in the brackets, nuts, J, adapted to be seated in the said bracket-supports respectively, and threaded rods, K, loosely connected at their lower ends to the platform supporting arms and passing up thence through apertures, prepared therefor in the brackets, and the perforated nuts threaded to fit the said rods, substantially as described.



3. In a header-harvester, a stationary frame, C, in combination with a bracket, I, adapted to be secured to the respective end bars or arms of the frame, provided with a transverse channel in the side next to the frame-bar, flaring at each end, a side socket, *i*³, extending outward from said channel, and apertures, *i*⁴, *i*⁵, above and below said socket, platform-supporting arm, E, the extremity, *e*, of which is adapted to fit and slide loosely in the channel between the bracket and the main frame, a nut, J, adapted to fit loosely in the socket and having a threaded perforation, a bracket, L, fastened to the arm E, below the bracket I, and provided with a projecting perforated lug, *l*, and a connecting-rod, K, passing loosely through the perforation in the bracket L, and provided with an enlargement or head on the under side of the latter, threaded to fit the perforation in the nut J, and passing up through the latter and the apertures, *i*⁴, *i*⁵, in the bracket I, being of less diameter than the latter to permit a limited lateral vibration, substantially as described.

4. In a header-harvester, the platform-supporting arms, E, in combination with a divided or loop-shaped stirrup, M, adapted to embrace the respective platform-arms and fit up against the under edge thereof, the platform-sill, D, of angle-iron with its horizontal web extending over projections on the stirrup, a fastening device passing through suitable ways in the stirrup and sill-web and connecting them to the platform-support or line-lever, and link-rods pivoted at their lower ends to the upper ends of the stirrups and at their upper ends connected to the tilting mechanism of the harvester, substantially as described.

5. In a header-harvester, platform-supporting arms, E, in combination with divided or loop-shaped stirrups, M, adapted to embrace the said arms respectively and provided with vertically-perforated projecting lugs, *n'*, angle-iron platform-sill, D, the horizontal web, *d*, of which is fitted over the said projecting lugs, U-bolts, N, adapted to embrace the line-levers and pass up through the respective stirrup-lugs and the horizontal web of the sill, nuts, or other fastening device, applied to the upper ends of said bolts, and link-rods, H, hinged at their lower ends to the upper ends of the stirrups M and connected at their upper ends to the tilting device of the machine, substantially as described.

6. In a header-harvester, platform-supporting arms, E, having upright extremities, *e*, in combination with brackets, I, secured to the respective ends of the main frame and having transverse side channels flaring at each end, vertical ribs or enlargements, i^4, on the outside of said brackets, having horizontal sockets, i^2, therein and apertures, i^3, i^5, running out upwardly and downwardly from said socket, the lower one somewhat wider than the upper, a threaded rod, K, connected at its lower end to the line-lever or platform-supporting arm, extending up thence through the vertical openings and socket of the rib i^4 and of a diameter substantially the same as the lower or inner diameter of the upper aperture, but less than the diameter of the lower aperture, and a nut, J, arranged in said socket and also receiving the threaded rod as it is passed up through the openings in the rib by turning it in said nut, substantially as described.

604,070. REED-ORGAN. WILLIAM S. MOSES, Tracy, Minn. Filed Sept. 3, 1896. Renewed June 17, 1897. Serial No. 641,184. (No model.)

Claim.—1. In a musical instrument of the character described, the combination with the exhaust mechanism, of a sounding-chamber movable sidewise and communicating with said exhaust mechanism by way of a slot and opening registering with each other, a transverse series of reeds mounted on the sounding-chamber and communicating therewith by valved openings, and headed operating-rods for operating the valves; together with a keyboard, having tracker-pins adapted to engage the headed operating-rods immediately below, substantially as shown and described.

2. The combination in a reed-organ, of the sounding-chamber having openings in the upper sounding-board thereof, a diaphragm supported a suitable distance above the sounding-board and having a series of openings which communicate with the openings in said sounding-board, a pipe-board having a corresponding series of pipes, and a reed-board having reed-chambers which communicate with the pipes and a series of vertical openings on a line with the corresponding openings in the diaphragm; together with pistons located within said vertical openings, and means for operating the pistons from a keyboard, substantially as shown and for the purpose set forth.

3. In a reed-organ, the combination, of the tone mechanism movable sidewise, a tilting keyboard adapted to operate the reeds of the tone mechanism; together with a single foot lever or pedal connected to the tone mechanism and keyboard for tilting them in opposite directions, and supplemental means for shifting the tone mechanism, substantially as shown and described.

4. In a reed-organ, the combination, of the tone mechanism movable sidewise, a tilting keyboard adapted to operate the reeds of the tone mechanism, a foot lever or pedal connected to the keyboard and to interposed means for tilting the rear part of the tone mechanism, and independent pedals connected to the ends of the tone mechanism by belts which pass over suitable guide-pulleys, substantially as shown and described.

5. In a reed-organ, the combination with the movable tone mechanism carrying friction-rollers, a tilting board forming a bearing for the friction-rollers, and an arm secured to said tilting board and connected to a pedal; together with a tilting keyboard connected to said pedal by interposed levers and connections, substantially as shown and for the purpose set forth.

6. In a reed-organ, the combination with the movable tone mechanism carrying friction-rollers, a tilting board forming a bearing for the friction-rollers, an arm secured to said tilting board and connected to a depending rod the lower end of which is passed through an opening in a foot-pedal, an adjustable stop attached to the lower end of the rod; together with a tilting keyboard connected to said pedal, and supplemental means for shifting the tone mechanism, substantially as shown and for the purpose set forth.

7. In a reed-organ, the combination with a foot lever or pedal, of a sliding plate mounted thereon and provided with lateral extensions and at its forward end with a toe portion, stationary rack bars with which the lateral extensions of the plate engage, and a spring for causing such engagement, substantially as shown and described.

8. In a reed-organ, a device for holding the foot levers or pedals depressed, consisting of a sliding plate mounted on the pedal and provided at its forward end with an upturned portion and at its sides with extensions, rack-bars with which said extensions engage and a spring for causing such engagement; together with a cam located on the pedal to engage the end of the sliding plate, substantially as shown and for the purpose set forth.

9. In a reed-organ, the combination with the coupler-boards, of a hinged board, screws adjustable upon said hinged board and in engagement with said coupler-boards, a centrally-fulcrumed lever one end of which is in contact with said hinged board, and interposed levers and rods connecting the first-mentioned lever to a foot lever or pedal, substantially as shown and described.

10. In a reed-organ, the combination with the two sets of reeds and keyboard having tracker-pins with rigid collars, of levers operating one set of reeds by engaging said collars, a rock-bar upon which the levers are fulcrumed, a lever connected at one end to the rock-bar, and an operating-rod connected to the other end of the lever, substantially as shown and for the purpose set forth.

11. In a reed-organ, the combination with the two sets of reeds mounted upon a movable sounding-chamber, of a keyboard having tracker-pins with rigid collars, levers operating one set of reeds by engaging said collars, a rock-bar upon which the levers are fulcrumed, said rock-bar having a looped wire attached thereto; together with a pivoted lever in sliding engagement with the rock-bar, and an operating-rod connected to the opposite end of said lever, substantially as shown and for the purpose set forth.

12. In a reed-organ the combination with a movable sounding-chamber or wind-chest and fixed bellows or exhaust mechanism, of connection between the parts and means for disengaging the sounding-chamber from the bellows and means for moving laterally the sounding-chamber substantially as shown and for the purpose set forth.

13. In a reed-organ the combination with a movable sounding-chamber or wind-chest and a fixed bellows or pumping device, of separable connections between the sounding chamber and bellows and means for detaching or separating the connections so that the sounding-chamber may be moved laterally substantially as shown and for the purpose set forth.

14. In a reed-organ, the combination with the exhaust mechanism or bellows, of a keyboard both mounted immovably upon the frame of the instrument, of a wind-chest or sounding-chamber movable longitudinally with respect to the frame, means for operating the valves or pistons of the sounding-chamber carried thereby so as to engage with the keys of the keyboard substantially as shown and for the purpose set forth.

15. In a reed-organ the combination with the exhaust mechanism, of a wind-chest or sounding-chamber movable relative to the exhaust mechanism, of reeds, and valve or piston operating means carried by the sounding-chamber; together with a keyboard fixedly mounted upon the frame, substantially as shown and for the purpose set forth.

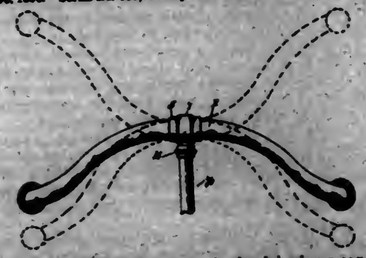
16. In a reed-organ, the combination with the exhaust mechanism or bellows, of a wind-chest or sounding-chamber movable laterally relative to said exhaust mechanism, openings connecting the bellows and sounding-chamber; the openings registering, substantially as shown and for the purpose set forth.

17. In a reed-organ the combination of a sounding-board having the tone mechanism mounted thereon and means for moving the same sidewise, a keyboard carried by the frame of the instrument so as to occupy a fixed position, of exhaust mechanism also occupying a fixed position with respect to the frame; together with mechanism for shifting the tone mechanism with respect to the keyboard, and the bellows or exhaust mechanism substantially as shown and for the purpose set forth.

18. In a reed-organ, the combination of the tone mechanism movable sidewise, a keyboard occupying a relatively-fixed position with respect to the tone mechanism; together with exhaust mechanism and means for changing the position of the tone mechanism with respect to the keys and exhaust mechanism substantially as shown and for the purpose set forth.

19. In a reed-organ, a wind-chest movable laterally with respect to a fixed keyboard and bellows, said wind-chest having openings in its inclosing boards, valves or pistons operating in conjunction with said openings and connections between the valves or pistons and the keyboard; together with air-passages for establishing communication between the bellows and wind-chest, substantially as shown.

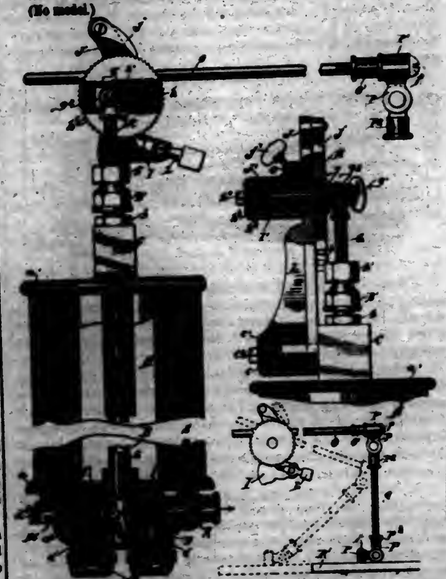
20. In a reed-organ the combination with the keyboard and bellows of a wind-chest or sounding-chamber moving laterally with respect thereto, said wind-chest or sounding-chamber having openings in the inclosing boards, valves or pistons therefor, connections with the valves or pistons, and keyboard, and means for connecting the bellows and wind-chest or sounding-chamber substantially as shown and for the purpose set forth.



21. In a reed-organ or similar instrument, the combination with a wind-chest movable laterally with respect to the keyboard and bellows, of tone mechanism connected with the wind-chest so as to be moved in conjunction with the same, substantially as shown.

22. In a reed-organ or similar instrument, the combination with the keyboard and bellows of ordinary construction, of a wind-chest or sounding-chamber supported so as to be movable laterally with respect to the keyboard and bellows, substantially as shown and for the purpose set forth.

23. In a reed-organ the combination with a movable sounding-chamber and fixed bellows, of connections between said parts and means for tilting the sounding-chamber to effect a disengagement of the connections and means substantially as shown for moving the sounding-chamber when tilted for the purpose set forth.



24. In a reed-organ the combination with a keyboard, sounding-chamber and bellows of connecting means, the sounding-chamber being supported so that it may be raised or tilted and when so moved will disengage the connections carried thereby from the keyboard and bellows substantially as shown and for the purpose set forth.

604,071. HANDLE-BAR. OTIS B. MOSHER, Joliet, Ill. Filed Nov. 20, 1896. Serial No. 613,203. (No model.)

Claim.—In combination, a steering-head having a cog at the extremity of the steering-stem, a handle-bar having a series of cavities at intervals in its circumferential length to interlock with the aforesaid cog, a split sleeve fitted about and receiving the handle-bar and having its end portions brought together forming a nook which is exteriorly threaded, and a clamp-nut mounted upon the steering-head and interlocking therewith, and having its threaded opening tapering to receive and draw together the separated portions forming the nook of the split sleeve to cause the latter to grip the handle-bar and at the same time hold the said cog in engagement with any one of the aforesaid cavities, whereby the handle-bar is locked, substantially as set forth.

604,072. LUBRICATING-PUMP. JOHN F. MCCANNA and BENJAMIN T. MCCANNA, Chicago, Ill. Filed Oct. 22, 1897. Serial No. 656,136. (No model.)

Claim.—1. In a lubricator, the piston reciprocating in a straight line, with the support capable of reciprocating substantially at right angles to the line of movement of the piston, the disk rotated by a moving part of the machinery, a graduated channel in the face of said disk, the block pivotally connected to said piston, and means for fastening said block at any desired point in said channel.

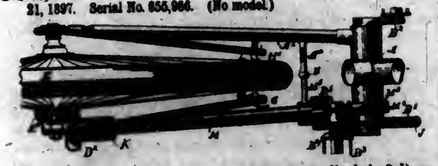
2. In a lubricator, the pivoted arm, I, terminating in the sleeve, I', the disk, H, having the journal, A^2, in said sleeve, I', the piston, G, reciprocating in a straight line and adjustable connections between said piston, G, and the disk or crank-wheel, H.

3. In a lubricator, the pivoted arm, I, having the sleeve, I' the notched disk, H, journaled in the sleeve, I', the piston, G reciprocating in a straight line, means for adjustably connecting said piston and the disk, H, and the pawl-arm, J, carrying the pawl, *j*, and pivotally mounted on the sleeve, I'.

4. In a lubricator, the pivoted arm I terminating in the sleeve I', the disk H having the journal A^2 in said sleeve I', the piston G reciprocating in a straight line, and adjustable connections between said piston G and the disk H comprising the dovetailed slot A in said disk, the block *g* slidingly mounted in said slot, means for securing it therein at any desired position, and the wrist-pin g^2 screwed into the block *g*, substantially as described.

5. In a lubricator, the pivoted arm I having the sleeve I'; the notched disk H journaled in the sleeve I'; the piston G reciprocating in a straight line; means for adjustably connecting said piston and the disk H, comprising the groove A, the screw-threaded block *g*, and the screw-threaded wrist-pin g^2, and the pawl-arm J carrying the pawl *j* and pivotally mounted on the sleeve I', all substantially as and for the purpose described.

6. In a lubricator, the pumping mechanism, the discharge duct, a supplemental pipe suitably located in connection to the discharge-duct at some visible point, and a valve for controlling the discharge through the discharge-duct or the supplemental pipe, as may be desired.



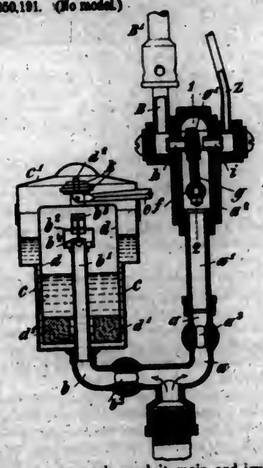
7. In a lubricator, the pumping mechanism, the discharge-duct, a supplemental pipe suitably located in connection to the discharge-duct at some visible point, and means for controlling the discharge through the discharge-duct or the supplemental pipe, as may be desired.

8. In a lubricator, the oil-cup, A, the discharge-duct, d^4, suitable mechanism and valves for discharging the lubricant from the oil-cup through the duct, d^4, the tube, S, terminating in said oil-cup, and the valve, R, for regulating the discharge through the duct, d^4, or the tube, S, as may be desired.

9 In a lubricator, the pivoted pawl-arm, J, the rod, O, adjustably connected thereto, the reciprocating portion, R', and the universal knuckle joints, P, interposed between the rod, O, and the reciprocating portion, R'.

10. In a lubricator, the reciprocating pawl-arm, J, the rod, O, adjustably mounted therein, the knuckle, P, having the sleeve, P^1, pivotally mounted on said rod, O, and the thimble, P^2, to which is connected the rod, Q, by means of a similar knuckle, P, to the reciprocating portion, R', of the machinery, substantially as and for the purpose described.

604,073. BICYCLE. JOHN MCLEAN, New York, N. Y. Filed Oct. 21, 1897. Serial No. 655,966. (No model.)



Claim.—1. In a bicycle operating by a longitudinal shaft D, extending through the tubular frame-piece M, a split clamp at the front end allowing of engagement and disengagement with the cross-tube A and also of lateral adjustment thereon, substantially as herein specified.

2. In a bicycle operating by a longitudinal shaft D, extending through the tubular frame-piece M, a detachable clamp at the front end allowing of engagement and disengagement with the cross-tube A, in combination with the bracing-arms M^3, A^2, and clamp N, adapted to allow the convenient assemblage and separation of the parts and also the adjustment of the engagement of the gear-wheels B', D', all substantially as herein specified.

3. In a bicycle operating by a longitudinal shaft D, extending through the tubular frame-piece M, a split clamp at the front end allowing of lateral adjustment upon and also of engagement and disengagement with the cross-tube A and the open yoke A^2, wings M^2 and fastening means L, adapted to allow a strong and rigid connection and an easy disconnection and removal or change of position relatively to the tube M and its immediately-associated parts, all combined and arranged to serve substantially as herein specified.

604,074. AUTOMATIC IGNITING DEVICE FOR GAS-LAMPS, &c. CARL F. HEBENDANZ, Wandsbeck, Germany. Filed Aug. 31, 1897. Serial No. 650,191. (No model.)

Claim.—1. A gas-supply conduit, main and igniter burner passages communicating therewith through its vertical walls at diametrically opposite points, and a valve adapted to be moved by variations of the pressure in said conduit to close or open one of said passages and open or close the other, for the purpose set forth.

2. A gas-supply conduit, main and igniter burner passages communicating therewith through its vertical walls at diametrically opposite points, and a loaded valve adapted to be moved by variations of the pressure in the conduit to close or open one of said passages and open or close the other, for the purpose set forth.

3. A gas-supply conduit, main and igniter burner passages communicating therewith through its vertical walls at diametrically opposite points, a rocking valve adapted to be moved by variations of the pressure in said conduit to close or open one of said passages and open or close the other, and means for adjusting the amplitude of the rocking movements of said valve, for the purpose set forth.

4. A gas-supply conduit, main and igniter burner passages communicating therewith through its vertical walls at diametrically opposite points, a rock-lever carrying a two-faced valve at its free end, and appliances adapted to be controlled by variations of the pressure in the conduit and thereby rock the valve-lever and move its valve to close or open one of said passages and open or close the other, for the purpose set forth.

5. A gas-supply conduit, main and igniter burner passages communicating therewith through its vertical walls at diametrically opposite points, a valve, and appliances outside of the conduit connected with said valve and controlled by variations of the pressure in the conduit and thereby move the valve to close or open one of said passages and open or close the other, for the purpose set forth.

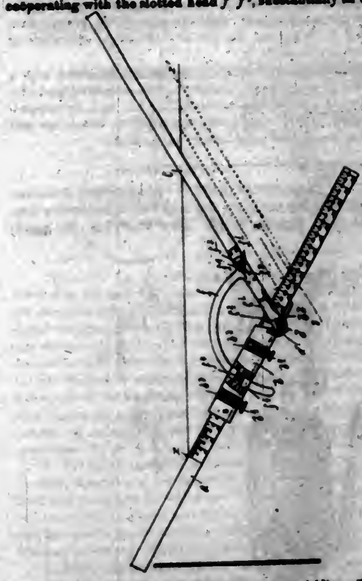
6. The combination with a gas-supply conduit, main and igniter burner passages communicating therewith through its vertical walls, and a valve-lever carrying a two-faced valve at its free end, of a gas-holder, its bell in communication with said conduit and a connection between said bell and the valve-lever, whereby the latter is rocked by variations of the pressure in the conduit to close or open one of the aforesaid passages and open or close the other, for the purpose set forth.

7. The combination with a gas-supply conduit, main and igniter burners in communication therewith through its vertical walls at diametrically opposite points, and a rock-lever carrying a valve at its free end adapted to close or open one of said passages and open or close the other; of a gas-holder, its bell in communication with said supply-conduit, a connection between the bell and rock-lever whereby the latter is operated by variations of the pressure in the conduit, and a pressure-controlled valve adapted to control the flow of gas to the bell, for the purpose set forth.

8. A gas-supply pipe, main and igniter burner passages leading therefrom, a valve-seat for each of said passages adjustable reciprocally, and a valve adapted to move from one seat to the other to open or close one of said passages and close or open the other, for the purpose set forth.

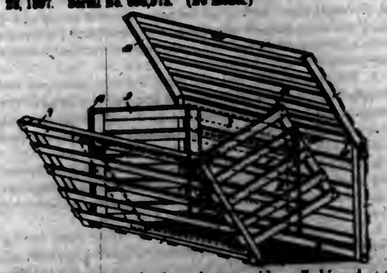
9. A gas-supply pipe, main and igniter burner passages leading therefrom, a valve-seat for each of said passages adjustable reciprocally, and a valve adapted to move from one seat to the other to open or close one of said passages and close or open the other, said valve moved by variations of the pressure in the supply-pipe, for the purpose set forth.

604,075. LINE-DIVIDING SCALE. AXEL A. OLSEN, Minneapolis, Minn., assignor of one-half to Charles A. Nelson, same place. Filed July 2, 1897. Serial No. 643,196. (No model.)



Claim.—1. A dividing-scale, involving a graduated base-rule with depending pin or brad at the intersection of the zero-mark with the lining edge thereof, a head or block mounted for sliding movement on said base-rule, and a lining-rule projecting from and carried by said sliding head or block, substantially as described.

2. A dividing-scale, involving a graduated base-rule with a depending pin or brad at the intersection of the zero-mark with the lining edge thereof, a head or block mounted for sliding movement on said base-rule, and a lining-rule pivotally mounted on and carried by said sliding head or block, substantially as described.



3. A dividing-scale, involving a graduated base-rule, a head or block mounted for sliding movement on said base-rule and provided with one or more finger-operated traction-rollers working over the graduated face of said base-rule, and a lining-rule projecting from and carried by said sliding head, substantially as described.

4. A dividing-scale, involving a graduated base-rule, a head or block mounted for sliding movement on said base-rule and provided with a pair of rubber-faced finger-operated traction-rollers which engage the graduated face of said base-rule, and a lining-rule projecting from and carried by said sliding head or block, substantially as described.

5. A dividing-scale, involving the graduated base-rule *a*, with the depending pin or brad *a'*, the sliding head *b* provided with the side flanges b^1, seats b^2 and extension b^3, the finger-operated traction-rollers b^4 b^5 mounted in said seats b^2, the lining-rule *c* with the extension *c'* having slots c^2, the set-screw *d* *d'* working in slot c^2, the segmental arm *f* working through keeper f^3 on said head *b* and provided with the slotted head f' f^2, and the thumb-nut and bolt f^4 f^5 cooperating with the slotted head f' f^2, substantially as described.

604,076. CRATE. GEORGE H. OWEN, Addison, N. Y. Filed May 28, 1897. Serial No. 638,572. (No model.)

Claim.—1. A crate having a bottom, side walls hinged at their lower edges to the bottom above the plane of its outer surface, to fold respectively inwardly and outwardly, end walls each pivotally mounted at one side edge upon the extremity of one of the side walls to fold inwardly in contact and parallel with said side wall, and a top hinged at one edge to and carried by the inwardly-folding side wall, and adapted to occupy a position in contact and parallel with the outwardly-folding side wall, whereby the end walls are inclosed between the top, bottom and side walls, substantially as specified.

2. A crate having a bottom provided at its side edges with inside cleats, side walls having inside vertical end cleats depending below the lower edges of said walls to abut against, and being pivotally mounted upon, the extremities of said side cleats above the plane of the bottom, proper, one of the side walls being adapted to fold outwardly to occupy a position in the plane of the bottom, and the other side wall being adapted to fold inwardly over the plane of the bottom, end walls each pivotally mounted upon a side wall and adapted to fold inwardly to occupy a position in the longitudinal plane of the end cleats thereof, and a top pivotally mounted upon the inwardly-folding side wall, to occupy a position in the plane thereof and parallel with the outwardly-folding side wall, whereby the end walls are inclosed between the planes of the top, bottom, and side walls, substantially as specified.

3. A crate having a bottom provided with side cleats, side walls having upper and end cleats, the lower extremities of the latter being pivotally mounted upon the extremities of said side cleats of the bottom, end walls pivotally mounted respectively upon the side walls to fold inwardly into the planes of the upper and end cleats thereof, and provided at their free ends with upwardly-projecting studs to engage seats in said upper cleats, and hold the side walls in their upright or normal positions, and a top pivotally mounted upon one of the side walls and provided with a depending ear to engage the upper edge of the other side wall, substantially as specified.

4. A crate having a bottom, and side walls hinged at their lower edges to the bottom to fold respectively inwardly and outwardly, end walls pivotally mounted respectively upon the extremities of the side walls to fold inwardly in contact and parallel therewith, and a top hinged to and carried by the inwardly-folding side wall, and adapted to occupy a position in contact and parallel with the outwardly-folding side wall, said top being provided with depending end flanges spaced apart an interval greater than the length of the side walls, to occupy positions outside of the extremities of said side walls when the crate is folded, substantially as specified.

5. A crate having a bottom, side walls hinged at their lower edges to the bottom to fold respectively inwardly and outwardly, end walls pivotally mounted respectively upon the extremities of the side walls to fold inwardly in contact and parallel therewith, means for limiting the outward swinging movement of the end walls when the side walls are in their normal positions perpendicular to the plane of the bottom, and a top hinged to and carried by the inwardly-folding side wall and adapted to occupy a position in contact and parallel with the outwardly-folding side wall, said top being provided with depending end cleats spaced apart at an interval greater than the length of the side walls, and also having at its free edge a depending ear to engage a recess in the upper edge of the outwardly-folding side wall, substantially as specified.

6. A crate having a bottom, side walls hinged at their lower edges to the bottom to fold respectively inwardly and outwardly, end walls pivotally mounted respectively upon the side walls to fold inwardly in contact and parallel therewith, upper inwardly-extending cleats on the side walls, provided respectively at the ends opposite to the pivotal points of said end walls with bayonet-seats of which the inlet-openings are offset inwardly from the planes of the normal positions of the end walls, an upwardly-extending stud carried by each end wall contiguous to its free edge and adapted to enter the bayonet-slot in the upper cleat of the opposite side wall from that upon which said end wall is mounted, and each end wall being also adapted to swing outwardly at its free end after its stud is engaged with said slot, and a top hinged to and carried by the inwardly-folding side wall, substantially as specified.

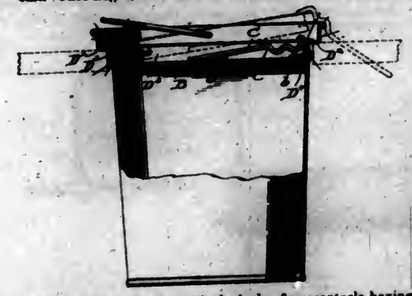
604,077. APPARATUS FOR CONTROLLING TEMPERATURE. REUBEN S. PEASE, Rose, Minn., assignor, by mesne assignments, of one-half to James U. Miner, Minneapolis, Minn. Filed Aug. 11, 1897. Serial No. 647,776. (No model.)

Claim.—1. In a circulatory liquid-heating system, a valve-chamber in the circuit, a valve therein having its port arranged to permit the liquid to flow onward through it only when the surface of the liquid in the chamber is above a predetermined level, and a fluid-holder connected with said chamber for producing fluid-pressure upon the liquid therein to vary its level and thereby control its flow through the valve and its circulation in the system, substantially as set forth.

2. In a circulatory liquid-heating system, a valve-chamber in the circuit, a valve therein having its port arranged to receive a full flow when the liquid-level is above the port and to present a gradually-diminishing passage-way as the level lowers toward the point of cut-off, and a fluid-holder connected with said chamber for producing varying pressure upon the liquid therein to change its level and thereby regulate its circulation, substantially as set forth.

3. The combination in a circulatory liquid-heating system, of a fluid-holder arranged to have its temperature affected by the heating system and having connection with a chamber in the liquid-circuit, whereby changes of the fluid-temperature cause corresponding variations of pressure upon the liquid and consequent fluctuations of the liquid-level in the chamber, and a valve in said chamber having a free port within the range of such fluctuations of the liquid-level, whereby the liquid circulation is controlled by the fluid-pressure, substantially as set forth.

4. In a circulatory liquid-heating system, a valve having a port provided in a chamber in the liquid-circuit, and a fluid-pressure device arranged to communicate with said chamber to regulate the level of the liquid therein relative to the valve-port, and means for regulating the pressure of the fluid upon the liquid in said chamber, substantially as set forth.



5. In a circulatory liquid-heating system, the combination with a valve-chamber, and a valve therein having a port arranged to receive a full flow when the liquid is at a given level and a gradually-diminishing flow as the level is lowered, and a temperature-controlled fluid-pressure device in communication with said chamber for changing the level of the liquid therein to regulate its flow through the port, substantially as set forth.

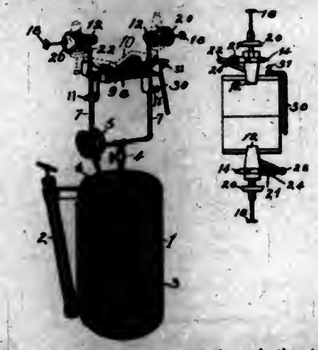
6. The combination in a liquid-heating system, of a circulatory pipe, a valve-fitting therein, said fitting provided with a diaphragm crossing its axis, a fluid-pipe communicating with said fitting on one side of the diaphragm and with a fluid-reservoir, and a pipe extending downward from within the fluid-pipe and communicating with the valve-fitting on the opposite side of said diaphragm, said pipe providing a communication for the liquid from one to the other side of the diaphragm, the flow of the liquid being regulated by the pressure of the fluid in the fluid-reservoir, substantially as set forth.

7. The combination with the pipes of a liquid-heating system, of a valve-shell connecting them, a vertical tube connected with the inlet, a shorter concentric tube communicating with the outlet and providing a port arranged to receive a gradually-diminishing volume as the level of the liquid is lowered from full flow to cut-off, and a fluid-pressure device having connection with said outer tube for producing varying pressure on the liquid in the tubes to regulate its flow, substantially as set forth.

8. In an incubator, the combination with a casing, of a circulatory liquid system and means for heating the liquid, a valve-chamber provided with a valve presenting a gradually-diminishing port as the level of the liquid is lowered from a full flow to the point of cut-off, and a suitable fluid-holder located in the incubator-casing and having communication with the valve-chamber for producing fluid-pressure on the liquid therein to regulate its level and consequently its circulation through said port and incubator, substantially as set forth.

604,078. PAIL AND PACKAGE. GEORGE J. RECORD, Connecaut, Ohio. Filed Aug. 5, 1897. Serial No. 647,231. (No model.)

Claim.—In combination with the body of a receptacle having an internal, annular groove near its upper edge, a bell-top for said body fitting within the upper part of the same and provided near its lower end with an annular offset which fits into the said groove and which forms a groove on the inner side of the said bell-top and a resilient seal provided with projecting lugs to snap into the said groove of the said bell-top the joints of these three parts being within the receptacle-body as shown.



604,079. DEVICE FOR CLOSING CANS OR OTHER RECEPTACLES. GEORGE J. RECORD, Connecaut, Ohio. Filed Jan. 3, 1898. Serial No. 665,403. (No model.)

Claim.—1. A device for closing receptacles consisting of two pivoted parts in the form of pliers provided with lateral extensions curved in a horizontal plane, the upper one of which extends beyond the lower, the said upper extension being adapted to rest flat on the peripheral part of a cap or seal, while the edge of the lower extension is adapted to fit against the side of a cylindrical receptacle or nozzle substantially as set forth.

2. A plier-like device for closing receptacles provided with a laterally-curved part adapted to rest flat on the peripheral part of a seal or cap around a portion of its circuit and having a corresponding part adapted to bear against the receptacle to which the said cap or seal is to be applied substantially as set forth.

604,080. BRAKING APPARATUS. BERNARD REES, Rochester, N. Y., assignor of one-half to the Red Cross Cement and Rubber Company, same place. Filed Dec. 20, 1897. Serial No. 664,312. (No model.)

Claim.—1. The combination with the tank, the stationary vertical oil-supply pipes, having their upper ends offset in opposite directions, of the vapor-burners swiveled on the ends of said pipes and movable in a vertical plane, and the work-support arranged beneath the pivots of the burners.

2. The combination with the tank, the two stationary vertical oil-supply pipes, and the adjustable vapor-burners located at the upper ends of said pipes, of the work-support adjustable vertically on the pipes, and securing devices for holding it in adjusted position thereon.

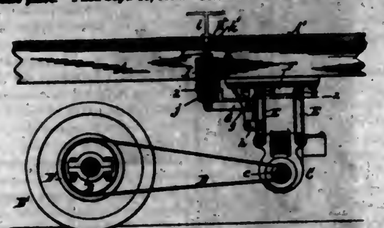
3. The combination with the tank, the stationary vertical oil-supply pipes, and the adjustable vapor-burners mounted on the upper ends thereof, of the work-support sleeved upon the supply-pipes, and set-screws for holding it in adjusted position.

4. The combination with the vertical oil-supply pipes, having the horizontally-extending upper ends, the vapor-burners rotatably adjustable on said ends, of the work-support arranged beneath the burners.

5. The combination with oil-supply pipes and vapor-burners at the upper ends thereof, of the work-support adjustable on the pipes, and the adjustable arm 30 on said support.

6. The combination with the tank, the pump thereon, the two vertical supply-pipes connecting with the tank and the vapor-burners on the upper ends of the pipes and rotatably adjustable thereon to swing in a vertical plane, and the work-support mounted on the two pipes below the burners, and adjustably connected therewith.

7. The combination with a supply-pipe, of the vapor-burner swiveled thereon to turn in a vertical plane and embodying the hollow body portion, having the vaporizing-chamber formed by the intersecting tangential passages and plugs at their outer ends, the jet-pipe 15 having the plug 19, the valve 18, and the cap 20 carried by the jet-pipe.



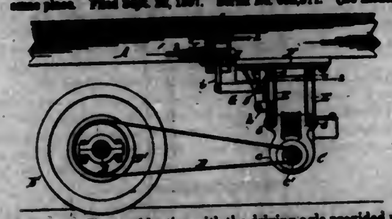
8. The combination with the work-support, the inclined slabs of refractory material thereon, and the oppositely-arranged adjustable vapor-burners cooperating with the slabs.

9. A vapor-burner embodying the hollow truncated cone and having the jet-aperture and a vaporizing-chamber connected with the jet-aperture and formed in the cone by a series of tangential intersecting passages, and plugs for closing the outer ends of said passages.

10. In a vapor-burner, the combination with the hollow conical body portion having the vaporizing-chamber formed by a series of intersecting tangential passages and removable plugs at their outer ends, of a supply-pipe connecting with one end of said chamber, and a jet-pipe connected to the other end and discharging into the body.

11. In a vapor-burner, the combination with the hollow body portion having the vaporizing-chamber therein formed of a series of intersecting tangential passages and removable plugs in their outer ends, of the jet-pipe 15 connected to the vaporizing-chamber having the plug 19, and the jet-aperture and valve controlling said aperture.

604,081. ELECTRIC-LIGHTING SYSTEM FOR RAILWAY-CARS. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Sept. 16, 1897. Serial No. 651,969. (No model.)



Claim.—1. The combination with the car, the driving-axle provided with a pulley, the dynamo provided with a pulley and capable of movement toward and from the driving-axle in a substantially horizontal direction, and a driving-belt applied to said pulleys, of a pressure device attached to the car and pressing the dynamo away from the driving-axle, whereby the pressure is applied to the belt for producing the desired normal speed of the dynamo-shaft irrespective of the weight of the dynamo, while the latter is moved toward the axle when the speed of the latter increases above that which produces the desired normal speed of the dynamo, causing a slip of the belt which neutralizes the excess of speed of the axle, substantially as set forth.

2. The combination with the car, the driving-axle provided with a pulley, the dynamo provided with a pulley, and the driving-belt, of front and rear links by which the dynamo is suspended from the car and rendered capable of moving lengthwise of the car in a horizontal position, and a pressure device attached to the car and pressing the dynamo away from the axle, substantially as set forth.

3. The combination with the car, the driving-axle provided with a pulley, the dynamo provided with a pulley, and a driving-belt, of front and rear links by which the dynamo is suspended from the car and rendered capable of movement lengthwise of the car in a horizontal position, an elbow-lever pivoted on the car and acting with its short arm upon the dynamo, and a pressure-spring attached to the car and connected with the long arm of said lever, substantially as set forth.

4. The combination with the car, the driving-axle provided with a pulley, the dynamo provided with a pulley and capable of movement toward and from the driving-axle, of a lever having one arm connected with the dynamo, a telescopic cylinder having one of its sections connected with the other arm of said lever, a pressure-spring arranged in said cylinder, and an adjusting-screw connected with the other section of said cylinder, substantially as set forth.

604,089. ELECTRIC-LIGHTING SYSTEM FOR RAILWAY-CARS. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Sept. 22, 1897. Serial No. 652,511. (No model.)

Claim.—1. The combination with the driving-axle provided with a pulley, a dynamo provided with a pulley and capable of movement toward and from the driving-axle, and a driving-belt applied to said pulleys, of a fluid-pressure mechanism which is connected with the movable dynamo and by which the same is pressed away from the driving-axle to tighten the belt, while the dynamo is drawn toward the axle by an excessive speed of the belt, substantially as set forth.

2. The combination with the driving-axle provided with a pulley, a dynamo provided with a pulley and capable of movement toward and from the driving-axle, and a driving-belt applied to said pulleys, of a fluid-pressure mechanism which is connected with the movable dynamo and by which the same is pressed away from the driving-axle to tighten the belt and which is provided with a pressure-equalizer by which a uniform fluid-pressure is maintained, substantially as set forth.

3. The combination with the driving-axle provided with a pulley, a dynamo provided with a pulley and capable of movement toward and from the driving-axle, and a driving-belt applied to said pulleys, of a cylinder and piston adapted to receive fluid-pressure and apply it to the movable dynamo and to press the same away from the driving-axle, a valve-chamber connected with said cylinder, a reducing-valve arranged in said chamber, and an equalizing-passage connecting the cylinder with said chamber, substantially as set forth.

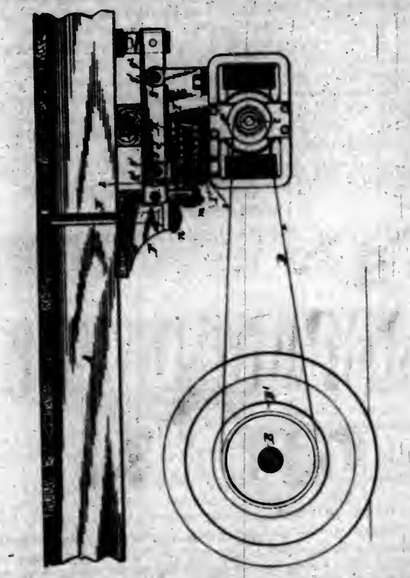
4. The combination with the driving-axle, a dynamo and a frictional mechanism whereby the dynamo is driven from said axle, of a cylinder and piston for tensioning such driving mechanism, a valve-chamber connected with said cylinder and having a flexible diaphragm and a fluid-inlet entering the same between the cylinder and said diaphragm, a reducing-valve controlled by said diaphragm and governing the admission of the fluid into the cylinder, and an equalizing-passage, connecting the cylinder with the portion of the valve-chamber above or in rear of said diaphragm, substantially as set forth.

604,088. ELECTRIC-LIGHTING APPARATUS FOR RAILROAD-CARS. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Sept. 20, 1897. Serial No. 651,903. (No model.)

Claim.—1. The combination with a car-body, a car-truck and its axle, and a dynamo driven from said axle, of a support on the car-body by which the dynamo is carried and which permits of the lateral movement of the dynamo with reference to the car-body, and a connection from the dynamo to the car-truck by which the dynamo is caused to remain in alinement with the car-axle, substantially as set forth.

2. The combination with a car-body having a transverse track on its under side, and a car-truck and its axle, of a dynamo capable of lateral movement on said track, and a pivoted frame which connects said dynamo with the truck and moves laterally with the truck, substantially as set forth.

3. The combination with a carriage adapted to move transversely on the under side of a car-body and a dynamo suspended therefrom and adapted to be driven from one of the car-axles, of a connecting-frame which connects said carriage with the car-truck and which causes the carriage and the dynamo to follow the swiveling movements of the car-truck and remain in alinement therewith, substantially as set forth.



4. The combination with a transverse track or way adapted to be arranged on the under side of a car-body, of a carriage mounted on said track, a dynamo suspended from said carriage and adapted to be driven from one of the car-axles, and a connecting-frame connecting said carriage with the car-truck and causing the carriage and the dynamo to follow the swiveling movement of the car-truck, substantially as set forth.

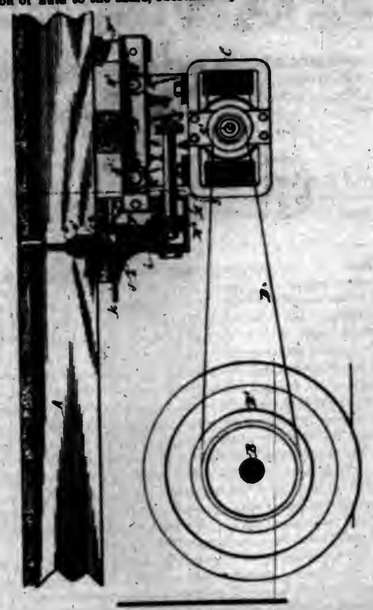
5. The combination with a transverse track or way adapted to be arranged on the under side of the car-body, of a carriage mounted on said track, a dynamo suspended from said carriage and adapted to be driven from one of the car-axles, and a connecting-frame adapted to connect said carriage with the car-truck carrying said axle and to be hinged to the truck by a transverse pivot, substantially as set forth.

6. The combination with a transverse track or way adapted to be arranged on the under side of a car-body, of a carrier or carriage adapted to run on said track, a dynamo suspended from said carriage and adapted to be driven from one of the car-axles and a connecting-frame adapted to connect said carriage with the car-truck carrying said axle, and a tension device for the driving-gear of the dynamo mounted on said connecting-frame, substantially as set forth.

7. The combination with a transverse track or way adapted to be arranged on the under side of the car-body and a carrier or carriage adapted to run thereon, of a dynamo adapted to be driven from one of the car-axles by a belt and suspended from said carriage by links swinging lengthwise of the car, a frame adapted to connect said carriage with the car-truck, a socket mounted on said connecting-frame, a follower moving therein, a tension-spring arranged in said socket and follower, and a lever operating with one arm against said follower and having its other arm connected with the suspension-links of the dynamo, substantially as set forth.

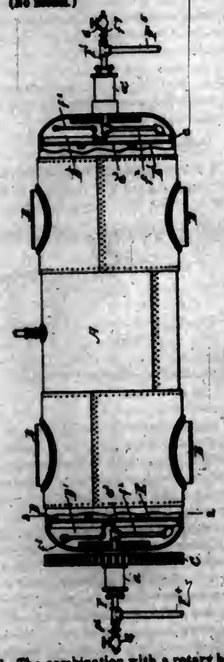
604,084. ELECTRIC-LIGHTING APPARATUS FOR RAILWAY-CARS. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Oct. 11, 1897. Serial No. 654,807. (No model.)

Claim.—1. The combination with the car-body and the driving-axle provided with a pulley, of a longitudinal track arranged on the under side of the car-body, a carriage mounted on said track and carrying a dynamo provided with a pulley, a horizontal socket mounted on said carriage, a follower applied to said socket, a pressure-spring arranged between said socket and follower, an adjusting device connected with said follower, and a belt applied to said pulleys and extending in a substantially horizontal direction from the driving to the driven pulley, substantially as set forth.



2. The combination with the car-body and a car-axle, of a longitudinal track or way arranged on the under side of the car-body, a carriage mounted on said track and carrying a dynamo, a horizontal socket mounted on said carriage, a tubular follower applied to said socket, a tension-spring arranged in said socket and follower, an adjusting-screw engaging with said follower, and an upright operating-shaft geared with said adjusting-screw, substantially as set forth.

604,085. ELECTRIC-LIGHTING APPARATUS FOR RAILWAY-CARS. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Oct. 14, 1897. Serial No. 655,135. (No model.)



Claim.—1. The combination with a railway-vehicle and its axle, of a longitudinal track or way arranged on the under side of the vehicle, a dynamo mounted on said track and capable of moving toward and from the car-axle, a frictional driving mechanism whereby the dynamo is driven from said car-axle, a horizontal cylinder supported by the vehicle, a piston arranged in said cylinder and connected with the dynamo, and means for delivering fluid under pressure to said cylinder, substantially as set forth.

2. The combination with a railway-vehicle and its axle, of a longitudinal track or way arranged on the under side of the vehicle, a dynamo-carriage mounted on said track and capable of moving toward and from the car-axle, a frictional driving mechanism whereby the dynamo is driven from said car-axle, a horizontal pressure-cylinder arranged between the car-axle, and the dynamo and supported by the vehicle, a piston arranged in said cylinder and having its rod connected directly with the dynamo-carriage and an inlet-valve controlling the admission of fluid to said pressure-cylinder, substantially as set forth.

3. The combination with a railway-vehicle, its axle and a movable dynamo adapted to be driven from the car-axle by a frictional driving mechanism, of a longitudinal track or way arranged on the under side of the vehicle and supporting the dynamo, a bracket supporting the front end of said track and carrying a horizontal pressure-cylinder and a valve-chamber communicating with said cylinder, a piston arranged in said cylinder and connected with the dynamo, and an inlet-valve arranged in said chamber and controlling the admission of fluid to the same, substantially as set forth.

604,086. ROTARY BLEACHING-BOILER. BRADLEY D. RIDER, Springfield, Mass., assignor of two-thirds to Charles McKerson and Allen A. Wheat, West Springfield, Mass. Filed June 7, 1897. Serial No. 638,862. (No model.)

Claim.—1. The combination with a rotary bleaching-boiler having a main compartment to hold the material or stock under treatment and auxiliary liquor-heating compartments adjacent to said main compartments, of stationary liquor-heating devices in said auxiliary chamber which deliver the heating medium to the lower part of said auxiliary liquor-heating compartments, and partitions separating said main compartment from the said auxiliary compartments, said partitions allowing free circulation of the liquor through the several compartments but preventing escape of the material under treatment from the main compartment into the auxiliary liquor-heating compartment.

2. The combination with a rotary bleaching-boiler having a main compartment to hold the material or stock under treatment and auxiliary liquor-heating compartments adjacent to said main compartment, a stationary steam-pipe passing through the trunnion of said rotary boiler and depending within the same so as to deliver steam at a point near the bottom of the auxiliary liquor-heating compartments and always below the level of the liquor therein, and partitions separating said main compartment from the said auxiliary compartments, said partitions allowing free circulation of the liquor through the several compartments but preventing escape of the material under treatment from the main compartment into the auxiliary liquor-heating compartment.

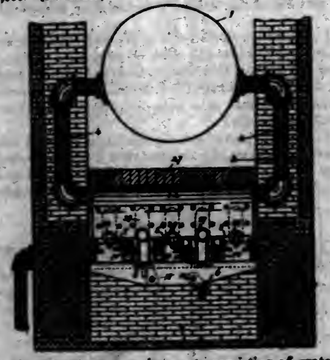
3. The combination with the rotary bleaching-boiler having a main compartment to hold the material or stock to be treated, and auxiliary liquor-heating compartments adjacent to said main compartment, of pipes leading through the trunnion of said boiler into said auxiliary compartments one of said pipes connecting with a stationary depending pipe so as to deliver steam or other heating medium near the bottom of the auxiliary compartment at a point below the level of the liquor, the other pipe connecting with a stationary vertical pipe rising to a point near the top of the boiler so as to permit exit of the heated air, partitions separating said main compartment from said auxiliary compartments, said partitions allowing free circulation of the liquor through the several compartments but preventing escape of the material under treatment from the main compartment in the auxiliary liquor-heating compartments, and manholes in said partitions to allow access to said auxiliary compartments.

4. The combination in a rotary boiler of the main compartment having one or more openings thereto and manhole-plates for closing the same, the liquor-heating chambers D', D^2 at the ends of the boiler, the perforated diaphragms having manholes, and doors or covers for said manholes opening into the main compartment, the said doors or covers for said manholes being provided with perforations, as and for the purpose described.

5. In a rotary boiler the main compartment D, and end compartment and a perforated partition-plate having a manhole and a perforated gate or cover for the same.

6. The combination with a rotary boiler having hollow trunnions, of a stationary pipe or casing having a plurality of passages through said trunnions, pipes supported at the inner end of said casing and connecting with the passages therethrough and pipes connected with said passages outside of said boiler.

7. The combination of the boiler, its hollow trunnions, means for rotating the boiler, its main chamber, the auxiliary chambers which are separated from the main chamber as specified, the stationary pipes extending through the hollow trunnions to said auxiliary chambers and having two passages, a stationary downward extension from one of said passages in said auxiliary chamber or chambers having an opening at or near its lower end and a stationary upward extension from the other of said passages, having an opening at or near its upper end.



8. The combination of the rotary boiler having a main compartment D and the end compartments D', D^2, the perforated plates E, the hollow trunnions, the stationary pipes having two passages extending through said trunnions into the chambers D', D^2, the stationary branch pipes, one of which is an inlet and the other an outlet pipe, and valves in the outlet-pipes outside the boiler.

604,087. WINDOW-AWNING. JAMES F. SARGENT, Saugus, Mass., assignor to Herbert M. Sylvester, Melrose, Mass. Filed Feb. 23, 1897. Serial No. 624,711. (No model.)

Claim.—An awning appliance with a frame composed of bent wire material, including a supporting part composed of the end piece, 4, and side arms, 5, said arms having twist-loops, 6, formed therein, approximately near the terminal ends thereof, the ends being overturned with eye-openings, X, and a swinging part having a corresponding end piece, and side arms with terminal ends bent, to hook-ed engagement with the twist-loops, 6, of said supporting part, combined with means for holding the supporting part in position to a window-frame and the like, said means including hook appliance, 10, for engaging the piece, 4, the staple appliances, 8, in the eye-openings, X, and removable pins in said staples, substantially as described.

604,088. STEAM OR HOT-WATER GRATE AND GENERATOR. FRANKLIN G. SAYLES, Boston, Mass. Filed June 16, 1897. Serial No. 640,202. (No model.)

Claim.—1. A box or pocket grate consisting of grates of alternating level, the grate on the lower level forming the bottom of the box or pocket, and having water-legs which form the sides of the box or pocket, substantially as described.

2. In combination with a boiler or hot-water reservoir, a box or pocket grate consisting of grates of alternating level, the grate on the lower level forming the bottom of the pocket and having water-legs which form the sides of the pocket, and waterway connections between the boiler or reservoir and said water-legs whereby circulation is completed from the boiler or reservoir to the water-legs, thence through the water-legs and return to the boiler or reservoir by another way, substantially as described.

3. In combination with a boiler or hot-water reservoir, a box or pocket grate consisting of grates of alternating level, the grate on the lower level forming the bottom of the pocket and having water-legs which form the sides of the pocket, a bridge-wall tank at the rear of the grate and water-pipe connection between the boiler or reservoir and said tank and between the said tank and the water-legs, a mud-drum at the front end of the grate, and water-pipe connections between said water-legs and said mud-drum and between said mud-drum and the boiler or reservoir whereby a complete circulation is made, substantially as described.

4. In combination with a boiler or hot-water reservoir, a box or pocket grate consisting of grates of alternating level, the grates on the lower level forming the bottom of the pocket and having water-legs which form the sides of the pocket, a bridge-wall tank at the rear of the grate and water-pipe connection between the boiler or reservoir and said tank and between the said tank and the water-legs, a mud-drum at the front of the grate and water-pipe connection between the water-legs and the mud-drum, and between the mud-drum and the boiler or reservoir, the outlet from the water-legs being of smaller sectional area than the sectional area of the water-legs, substantially as and for the purpose described.

5. In combination with a boiler or hot-water reservoir and grate, a bridge-wall tank at the rear of the grate, a partition between the fire-box and combustion-chamber but not extending to the top of the chamber and having a series of hot-air ducts leading from the fire-box to the combustion-chamber, substantially as described.

6. In combination with a boiler or hot-water reservoir and grate, a bridge-wall tank at the rear of the grate rising above the level thereof but not extending to the top of the chamber and having a series of hot-air ducts from the fire-box through the tank to the combustion-chamber, the openings to said ducts being in part above and in part below the surface of the grate, substantially as described.

7. In combination with a boiler or hot-water reservoir, a box or pocket grate consisting of grates of alternating level, the grate on the lower level forming the bottom of the pocket and having water-legs which form the sides of the pocket, a bridge-wall tank at the rear of the grates and water-conduits from the boiler or reservoir to the tank, from the tank to the water-legs and from the water-legs to the boiler or reservoir said bridge-wall tank forming a partition back of the

fire-box part way to the top of the chamber, and having a series of hot-air ducts leading from different levels through the tank to the combustion-chamber, the entrances to some of the ducts being so located as to conduct fresh air from below the surface grates as well as the hot air from above the surface, and other ducts conducting the gases which rise from the box part of the grates, substantially as described.

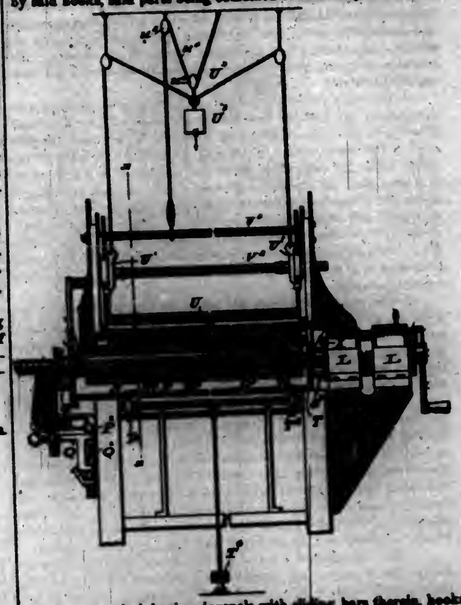
8. In combination with a boiler or hot-water reservoir and grate, a bridge-wall tank at the rear of the grate rising part way above the level thereof, hot-air ducts leading from the fire-box through the tank and into the combustion-chamber, a baffle-wall within the combustion-chamber at some distance back of the tank and projecting from the roof part way to the bottom of the chamber, substantially as described.

9. In combination with a boiler or hot-water reservoir and grate, a bridge-wall tank at the rear of the fire-box, and a series of hot-air ducts from the fire-box, through said tank and into the combustion-chamber, the said ducts starting at alternating levels and opening into the combustion-chamber at a higher level than the entrance ends, substantially as described.

10. In a box or pocket grate consisting of grates of alternating level, a series of pockets of which the walls thereof are composed of water-legs, the water-legs of one pocket being connected by a water-conduit with the water-legs of another pocket, substantially as described.

604,089. DEMIJOHN. ISAAC M. SCHELLENBERG, Royersford, Pa. Filed Aug. 9, 1897. Serial No. 647,663. (No model.)

Claim.—1. The combination with a demijohn, the wicker-work case and the wicker-work handle, of the metal ring at the bottom of said case, the vertical wire formed integral therewith and extending up and interlaced with said handle and wound around the neck of the demijohn and the opposite vertical wire connected with said ring and interlaced with the wicker-work case, substantially as described.



2. The combination with the demijohn and the wicker-work case, of the ring at the bottom of said case having a loop at one end through which the other end is passed and extended upwardly, the handle, the strands of which are twisted around said upwardly-extending wire and the upwardly-extended wire twisted around the neck, substantially as described.

3. The combination with the demijohn and the wicker-work case, of the ring at the bottom of said case, formed with a loop at one end through which the other end passes and is extended upwardly and formed with a loop intermediate its ends, the handle, the strands of which are passed through said loop and then twisted around the said wire and wound around the neck of the demijohn, and the upwardly-extending wire twisted around the neck, substantially as described.

604,090. MACHINE FOR MAKING PAPER TUBES. FERDINAND SCHOETTLE, Philadelphia, Pa.; Mary A. Schoettle and William C. Schoettle executors of said Ferdinand Schoettle, deceased. Filed June 9, 1892. Serial No. 436,053. (No model.)

Claim.—1. In a machine for making paper tubes, a frame, a mandrel mounted in standards on said frame and having a detachable journal, a pasting-trough on said frame, and an adjustable carriage having mounted thereon a cutter intermediate of said mandrel and trough, and an automatically-detachable holder on said mandrel.

2. A mandrel having journals with sliding bars therein, a hook on one end of each of said bars, a spring bearing against a pin on each of said bars, and a holding-bar with ends adapted to be engaged by said hooks, said parts being combined substantially as described.

3. A mandrel having journals with sliding bars therein, hooks on the one end of said bars, and shoes on the other end thereof, springs bearing against pins on said bars, a holding-bar with ends engaged by said hooks, and bearings for said journals having cams thereon engaged by the said shoes, said parts being combined substantially as described.

4. In a machine for making paper tubes, a mandrel with journals having spring-controlled bars therein, with hooks on one of their ends adapted to engage the ends of a holding-bar, and swinging arms adapted to engage the other ends of said bars so as to operate them against said springs, said parts being combined substantially as described.

5. In a machine for making paper tubes, a mandrel, a detachable journal therefor, a bearing for said journal having a swinging support, and means for holding said support in place when the journal is secured to the mandrel, said parts being combined substantially as described.

6. A mandrel, a detachable journal therefor, a swinging bearing for said journal, a lever-arm for supporting said bearing when the journal is connected with the mandrel, and an arm for supporting said bearing when the journal is detached therefrom, said parts being combined substantially as described

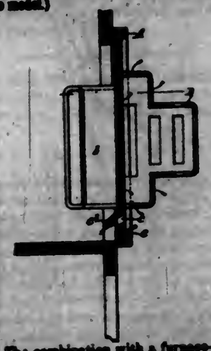
7. A mandrel having the bearing of one of its journals provided with a slide, and a crank-handle for said journal having a stop for said slide, the opposite journal being detachably connected with the mandrel and provided with a lug which is adapted to enter a recess in said mandrel, substantially as described.

8. A journal for the mandrel having a crank-handle therefor with a stop thereon, a slide on the bearing of said journal adapted to engage said stop, a stud with a lug thereof on the opposite journal, the latter being detachable from the mandrel, the mandrel having a socket with a recess to receive said stud and lug, and a supporting-arm for the detachable journal, said parts being combined substantially as described.

9. A mandrel, a binder removably connected therewith, a detachable journal for said mandrel adapted to interlock therewith, and a device on the other journal whereby the interlocking means for the detachable journal may register, said parts being combined substantially as described.

604,091. HORSESHOE. ROWLAND F. SMITH, Springfield, Ill. Filed July 26, 1897. Serial No. 645,260. (No model.)

Claim.—1. In a horseshoe, a calk having a lodge, in combination with an affixable member, a detachable member, and means for connecting said members, the lodge on said calk serving as a cushion between said members, as set forth.



2. In a horseshoe, the combination of an affixable member having lugs, a detachable member fitting on said affixable member and having openings adapted to receive calks, removable flanged calks fitting in the openings in said detachable member, and screws connecting said members, as set forth.

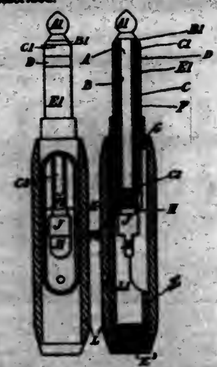
604,092. KITCHEN UTENSIL. MILES W. SMITH, Long Island City, N. Y. Filed Sept. 14, 1896. Serial No. 605,709. (No model.)

Claim.—The herein-described kitchen utensil comprising a bar 5, having an angular projection 6, a segmental lever 8, pivotally connected with bar 5 at 7, a spiral spring 10 mounted between said bars, a bar 11 pivotally connected with said segmental lever having an angular projection 13 adapted to engage the angular projection on the bar 5, and a keeper 12 secured to the bar 5, and adapted to hold the bar 11 and permit the same to slide therein, substantially as shown and for the purpose set forth.

604,093. FURNACE-DOOR. GEORGE B. STEWARD, London, England, assignor of two-thirds to Edwin Ragley Gimkin, same place, and Joseph Cash, Coventry, England. Filed June 24, 1897. Serial No. 642,976. (No model.)

Claim.—1. The combination with a furnace-door, having a pair or pairs of slits or openings, of curved air-trunks projecting into the furnace, and forming air-passages, the vents of each pair of which are opposed to each other, but situate in different planes, as and for the purpose set forth.

2. The combination with a furnace-door having slits or openings covered by curved air-trunks projecting inward, and arranged in pairs, with vents opposed to each other, but in different planes, of a metal box on the front of the door covering the slits, and having openings in its front, and in all its sides, as and for the purpose set forth.



3. The combination with a furnace-door having slits or openings covered by curved air-trunks arranged in pairs, with vents opposed to each other, but in different planes, and a perforated metal box on the front of the door, covering the slits of other openings for the admission of air below the curved trunks and metal box, and having deflectors set at different angles to the door-face, as and for the purpose set forth.

4. The combination, in a furnace-door, of slits or openings covered by curved air-trunks arranged in pairs with vents opposed to each other, but in different planes, of other air-openings below the curved trunks, and covered by deflectors set at different angles to the door-face, as and for the purpose set forth.

5. The combination with the dead-plate of a furnace, of a furnace-door having longitudinal openings near its lower edge each provided at its upper side with a deflector, said deflectors being set at different angles to the door-face, whereby a whirling stream of air is directed toward the dead plate, and, by it, deflected toward the fire, as set forth.

604,094. TELEPHONE-SWITCHBOARD PLUG. JAMES TAYLOR, Knutsford, County, England. Filed Nov. 21, 1896. Serial No. 613,021. (No model.)

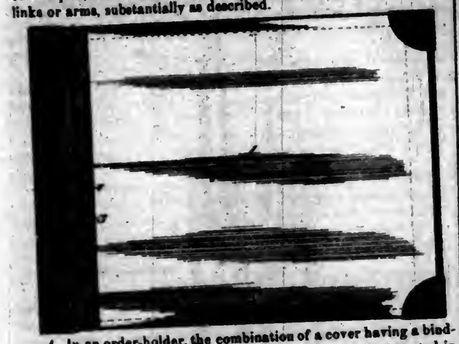
Claim.—1. In a telephone-switchboard plug, the combination with a metal bolt A, having the head formed solid with it, of metal tubes C and E, insulating-tubes B and F, insulating-rings D and G, nuts H and J, casing L, screws K and L', and electrical conductors, substantially as described.

2. In a telephone-switchboard plug, the combination of a central metal bolt A having a contact-head, metal tubes C and E, said tube C having a tag C', insulating-tubes B, F, said tube F having an opening F' and a groove F² to receive the tag, insulating-rings D and G, and nuts H and J, all arranged substantially as described.

3. In a telephone-switchboard plug, the combination with a metal tube C, having a collar and tag, of an insulating-ring D, and tube F fitting over the tube C, the insulating-tube F having an opening through which the tag passes, and a groove within which it lies.

4. In a telephone-switchboard plug, the combination with a metal bolt having a head at one end, an insulating-sleeve thereon and having one end enlarged to form a washer lying adjacent to the head of the bolt, a metal sleeve on the said insulating-sleeve, said metal sleeve having a collar at one end lying adjacent to the washer of the insulating-sleeve and having a tongue at the opposite end, an insulating ring or washer on the metal sleeve adjacent to the collar thereof, a second metal tube forming the body of the plug having one end smaller than the other, a second insulating-sleeve on the second metal tube, one portion of said latter sleeve fitting within the said smaller portion of the second metal tube, and the other portion fitting in the larger part of the latter tube, an insulating-washer on the smaller end of the said second insulating-sleeve and a nut on the bolt to secure the various parts thereon, and an insulating-casing secured to the body of the plug, all as specified.

5. In a telephone-switchboard plug, the combination with a metal bolt having a head at one end, an insulating-sleeve thereon and having one end enlarged to form a washer lying adjacent to the head of the bolt, a metal sleeve on the said insulating-sleeve, said metal sleeve having a collar at one end lying adjacent to the washer of the insulating-sleeve and having a tongue at the opposite end, an insulating ring or washer on the metal sleeve adjacent to the collar thereof, a second metal tube forming the body of the plug having one end smaller than the other, a second insulating-sleeve on the second metal tube, one portion of said latter sleeve fitting within the said smaller portion of the second metal tube, and the other portion fitting in the larger part of the latter tube, an insulating-washer on the smaller end of the said second insulating-sleeve, and a nut on the bolt to secure the various parts thereon, an insulating-casing secured to the body of the plug, a second nut having a flattened portion, and a screw passing through the plug-body and engaging a slot in the said second insulating-tube.



604,095. ORDER-HOLDER. ROBERT A. TERRELL, St. Louis, Mo., assignor to the Globe & Truppel Manufacturing Co., same place. Filed June 1, 1897. Serial No. 638,894. (No model.)

Claim.—1. An order-holder comprising an inflexible lower cover, an inflexible upper cover, means whereby the covers are hinged together at a distance apart so as to locate the pivotal point of the upper cover forward of the pivotal point of the lower cover, and a spring connection between the covers; substantially as described.

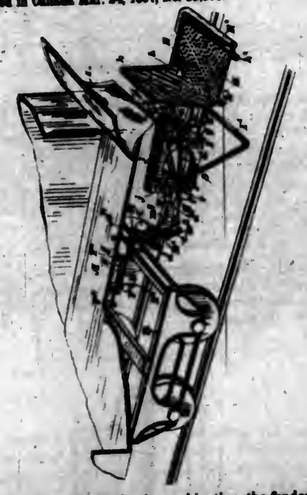
2. An order-holder comprising an inflexible lower cover, an inflexible upper cover, means whereby the covers are hinged together at a distance apart so as to locate the pivotal point of the upper cover forward of the pivotal point of the lower cover, and springs adapted to control the hinge between the covers; substantially as described.

3. In an order-holder, the combination of two covers, a binding to said covers, pins secured to the said binding of one of said covers,

links or arms connecting said pins with the second cover, pivotal attachment between said second cover and said links or arms, forward of said pins, and coil-springs about said pins, adapted to depress said links or arms, substantially as described.

4. In an order-holder, the combination of a cover having a binding, a spring box carried by said cover, a pin or shaft mounted in said box, a sleeve mounted on said pin or shaft, a coil-spring surrounding said sleeve, a second cover provided with pivotal connection to said spring, whereby said spring is arranged to depress said second cover upon said first cover forward of the rear end of said first cover of the line of said spring; substantially as described.

604,096. FIRE-ESCAPE. FRANKLIN UNDERWOOD, Burt's Mills, N. Y. Filed Apr. 26, 1897. Serial No. 634,083. (No model.)



Claim.—1. In a device of the class described, the combination of a wheel, a frame composed of two substantially T-shaped sides permanently connected at the bottom and receiving the wheel between their upper portions, one of the sides having the terminals of its top portion extended across the periphery of the wheel, a rod mounted on the extended terminals of the said side and extending across the outer face of the other side, and a lever fulcrumed on the rod and engaging the outer face of the adjacent side of the frame, substantially as and for the purpose described.

2. In a device of the class described, the combination of a wheel forming a drum and adapted to receive the line, a frame composed of two substantially vertically disposed sides permanently connected at the bottom and having the wheel journaled between their upper ends, the latter being compressible to clamp and release the wheel, a rod carried by one of the sides, and a lever fulcrumed on the rod, provided with a spring-coil to receive the same and engaging the other side of the frame yieldingly, whereby the two sides of the frame are caused to engage the wheel yieldingly, substantially as described.

3. In a device of the class described, the combination of a wheel, a frame provided at its bottom with a loop, and composed of two substantially T-shaped sides having the wheel arranged between them, one of the sides having the terminals of its top portion extended across the periphery of the wheel, a rod journaled on the extended ends, a substantially Y-shaped brake-lever fulcrumed on the rod, having its arms coiled around the same to form springs and extended to provide legs, and a ring mounted on one side of said loop and arranged to engage the handle of the lever, substantially as described.

4. In a device of the class described, the combination of a wheel, a frame composed of two sides having the wheel journaled between them, one of the sides being extended across the periphery of the wheel at opposite sides thereof, a rod carried by the extended portions of the frame, and a lever having diverging arms coiled around the rod and extended to engage the frame, substantially as and for the purpose described.

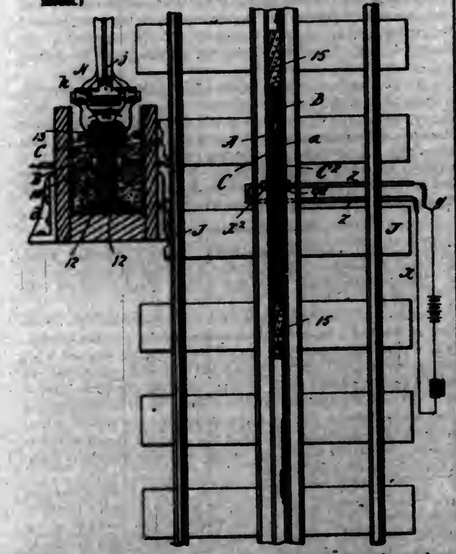
604,097. STREET-CAR FENDER. JAMES R. A. WALKER, Walkerton, Canada. Filed May 31, 1897. Serial No. 637,502. (No model.) Patented in Canada Mar. 24, 1897, No. 55,396.

Claim.—1. In a car-fender, in combination, the fender, the truck, the supporting-bar attached to the truck and having inclined ways, the double vertical frame secured to the fender and provided with friction-rollers to run on the ways and a suitable spring for holding the double frame and fender, so that the friction-rollers rest on the highest points of the ways as and for the purpose specified.

2. In a car-fender, in combination, the fender, the truck, the supporting-bar having inclined ways, the central stud on the truck, the vertical pin extending through the stud and connected to the rear end of the supporting-bar, means connecting the pin to the bottom of the car for swinging the supporting-bar, the double vertical frame secured to the fender and provided with friction-rollers to run on the ways and a suitable spring for holding the double frame and fender so that the friction-rollers rest on the highest points of the ways as and for the purpose specified.

3. In a car-fender, in combination, the fender, the truck, the supporting-bar having inclined ways, the central stud on the truck, the vertical pin extending through the stud and connected at the rear end of the supporting-bar, a rod extending rearwardly from the top of the vertical pin extending through the stud, the screw-spindle held from longitudinal movement and the bracket on such spindle having a flat end abutting the bottom of the car, a notch at the bottom of the bracket into which the rod attached to the vertical pin extends, the double vertical frame secured to the fender and provided with friction-rollers to run on the ways and a suitable spring for holding the double frame and fenders so that the friction-rollers rest on the highest points of the ways as and for the purpose specified.

4. In combination, the fender, the truck, the supporting-bar provided with inclined ways, double vertical frame connected to the fenders and provided with the friction-rollers, the spring for holding such frame, so that the friction-rollers are normally situated at the front highest points of the ways, and the arms attached to the front end bars and provided with flanged wheels designed to ride on the track behind the fender as and for the purpose specified.

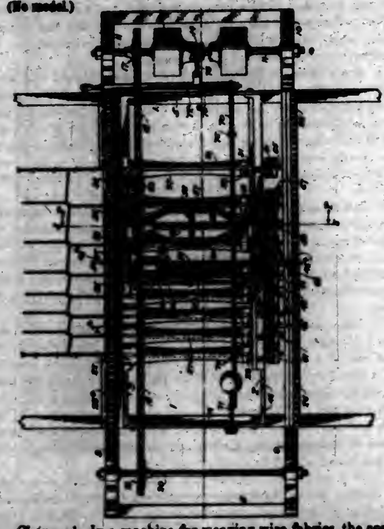


5. In combination, the fender, the supporting-bar and double frame connected to the fenders and supporting the same provided with a central opening, the spring connected to the double frame and to one end of the bar and the stop-pin on the bar designed to come in contact with one end of the opening of the double frame as and for the purpose specified.

6. In combination, the fender, and supporting-bar, the double vertical frame, the curved supplemental fender, the arm at the forward end of the supporting-bar, the shaft extending through the upper end of the arm, the arms on the end of the shaft connected to the lower end of the arc-shaped fender and means whereby upon the backward depression of the fender the arc-shaped fender is thrown downwardly into proximity with the front edge of the lower fender as and for the purpose specified.

7. In combination, the fender, and supporting-bar, the double vertical frame, the curved supplemental fender, the arm at the forward end of the supporting-bar, the shaft extending through the upper end of the arm, the arms on the end of the shaft connected to the lower end of the arc-shaped fender, pinions on the shaft, a counter-shaft journaled on the arm, spur-wheels secured to the counter-shaft meshing with the pinions on the upper shaft, levers on the end of the shaft, connecting-rods attached to the upper end of such levers, guiding-rods supported and designed to move longitudinally in suitable sleeves, collar on the guiding-rods and set-screws for fastening the rear ends of the connecting-rods to such collar and a cross-bar at the rear end of the connecting-rods designed to be thrown rearwardly by the double vertical frame as and for the purpose specified.

8. In combination the fender and supporting-bar, the double vertical frame, the curved supplemental fender, the arm at the forward end of the supporting-bar, the shaft extending through the upper end of the arm, the arms on the end of the shaft connected to the lower end of the arc-shaped fender, pinions on the shaft, a counter-shaft journaled on the arm, wheels secured to the counter-shaft meshing with the pinions on the upper shaft, levers on the end of the shaft, connecting-rods attached to the upper ends of such levers, guiding-rods supported and designed to move longitudinally in suitable sleeves, collar on the guiding-rods and set-screws for fastening the rear end of the connecting-rods to such collar, a cross-bar at the rear end of the connecting-rods designed to be thrown rearwardly by the double vertical frame, and a spring connected to the lower end of one of the levers on the counter-shaft and to the supporting-bar as and for the purpose specified.



604,098. RAIL CONDUCTOR FOR ELECTRIC SYSTEMS. LOUIS R. WALKER, Springfield, Mass., assignor of one-half to Francis W. Dickinson, same place. Filed Aug. 18, 1897. Serial No. 648,787. (No model.)

Claim.—1. The combination of several rails in end-to-end arrangement, an intermediate one A thereof consisting of two opposite longitudinally-ranging metallic sections and an intermediate rail of non-conducting material supporting and insulating said sections, end portions of said intermediate rail overlying the ends of said metallic sections and serving to insulate the respective metallic side sections at their ends from the rails adjoining the ends of said intermediate sectional rail A, substantially as described.

2. In a railway, the combination with the usual side track-rails J J, and the intermediate third rail comprising lengths of rail in endwise arrangement, an intermediate one A of these rails or sections consisting of two opposite longitudinally-ranging metallic sections, and an intervening length of non-conducting material supporting and insulating said opposite metallic sections, the ends of said latter sections being insulated from the rails which endwise adjoin the said rail-section A, and which are of metal, wires *x y* joined to said metallic sections and forming an electric circuit comprising therein a generator, and an electromagnet also comprised in said circuit having an armature, substantially as described.

604,099. WIRE-FENCE-WEAVING MACHINE. WILLIAM H. WARNER, Malvern, Kans. Filed Aug. 23, 1897. Serial No. 649,201. (No model.)

Claim.—1. In a machine for weaving wire fabrics, the combination with a carriage, and a shuttle, of an advancing-shaft for said carriage, a common driving connection, a clutch device for said advancing-shaft, and a latch arranged to lock the carriage and having an operative connection with said clutch device for the carriage-advancing shaft, whereby the adjustment of the latch to release the carriage brings into service the clutch device and the advancing-shaft to feed the carriage, substantially as described.

2. In a machine for weaving wire fabrics, the combination with a carriage, warp-carriers, and a shuttle, of a shuttle-driving mechanism mounted on the carriage for rotating the shuttle, a feed mechanism for intermittently moving the carriage, a common driving connection for the carriage-feed mechanism and the shuttle-driving mechanism, and a locking device having operative connections with the shuttle-driving mechanism and the carriage-feed mechanism, said locking device arranged in relation to the shuttle-driving mechanism to be operated thereby after the shuttle has been rotated a predetermined time and serving to throw the carriage-feed mechanism into operative engagement with the common driving connections, substantially as described.

3. In a wire-fence-weaving machine, the combination of the warp-carriers, a shuttle-carrier having a shuttle, a feed mechanism for imparting intermittent traveling movement to the shuttle-carrier, a locking mechanism for holding the shuttle-carrier at rest in the intervals between its feed, and a trip mechanism acting in synchronism with a driving mechanism for the shuttle and the warp-carrier and arranged to release the locking mechanism and the shuttle-carrier automatically after the shuttle and the warp-carrier have completed the twisting of the warp and weft wires, as set forth.

4. In a wire-fence-weaving machine, the combination with a series of warp-carriers, a shuttle-carrier, and a shuttle, of a driving mechanism carried on the shuttle-carrier for imparting rotary motion to the shuttle and the warp-carrier with which the shuttle may be alined, and a trip-latch mechanism acting in conjunction with the shuttle-driving mechanism to lock the shuttle-carrier and release the same at intervals, as and for the purposes described.

5. In a wire-fence-weaving machine, the combination with a series of warp-carriers, a shuttle-carrier, and an intermittent feed mechanism for said shuttle-carrier, of a shuttle mounted in the shuttle-carrier, a driving mechanism for rotating the shuttle and the warp-carrier with which it may be alined, a latch mechanism for the shuttle-carrier, and a trip mechanism between the shuttle-driving mechanism and the latch mechanism, for the purposes described, substantially as set forth.

6. In a machine for weaving wire fabrics, the combination with a carriage, and a shuttle, of a shuttle-driving mechanism, a latch mechanism for locking the carriage, and a time-controlled trip mechanism in operative relation to the shuttle-driver and serving to free the latch after the shuttle has made a predetermined number of revolutions, substantially as and for the purposes described.

7. In a machine for weaving wire fabrics, the combination with a carriage, warp-carriers, and a shuttle, of a shuttle-driver, a latch mounted on the carriage, and a time-controlled trip having its operating-arm arranged to ride against the latch and actuated by independent collars which are capable of independent play and of interlocking engagement with one another, the shuttle-driver, and the operating trip-arm, substantially as described.

8. In a wire-fence-weaving machine, the combination with warp-carriers, a shuttle-carrier, and a shuttle, of an endless drive-chain, a driving mechanism for the shuttle and the warp-carrier alined therewith, a latch mechanism for the shuttle-carrier, a feed or advancing shaft for the shuttle-carrier, and a clutch-controlled driving-gear between the drive-chain and the feed-shaft and arranged to be thrown into and out of action by the latch mechanism, as and for the purposes described.

9. In a wire-fence-weaving machine, the combination with warp-carriers, a shuttle-carrier, and a shuttle, of a latch mechanism for the shuttle carrier, a feed-shaft journaled on the shuttle-carrier, a drive-chain, a clutch-controlled gear between the drive-chain and the shuttle-carrier feed-shaft, and a shipper mechanism for said clutch acting in connection with the latch mechanism, as and for the purposes described.

10. In a wire-fence-weaving machine, the combination with warp-carriers, a shuttle-carrier, and a shuttle, of a latch mechanism on the shuttle-carrier, a feed-shaft journaled on the shuttle-carrier, a drive-chain, a clutch-controlled gear between the drive-chain and the feed-shaft for the shuttle-carrier, a shipper-rod between said clutch-controlled gear and the latch mechanism, a mechanism for rotating the shuttle and the warp-carrier alined therewith, and a trip mechanism between the shuttle-driving devices and the latch mechanism, for the purposes described, substantially at set forth.

11. In a wire-fence machine, the combination with a carriage, and a shuttle, of a series of warp-carriers each having its shell-pinion provided with lugs, a shaft journaled in said carriage, the cam-wheel provided with a toothed segment and with projecting arms to engage with the lugs and the teeth of the shell-pinions on the warp-carriers successively, a latch, and a time-controlled trip mechanism, substantially as described.

12. In a wire-fence-weaving machine, the combination with a shuttle carrier, and a shuttle, of a series of warp-carriers each provided with a shell-pinion having teeth and a lateral eccentric stud, a cam-wheel mounted on the shuttle-carrier and provided with teeth for a part of its circumference and with lateral entrance-studs to coact with the shell-pinions, and mechanism for rotating the cam-wheel and the shell-pinion of the warp-carrier with which the cam-wheel may be temporarily engaged, as and for the purposes described.

13. In a wire-fence-weaving machine, the combination with a shuttle-carrier, a shuttle, and a series of warp-carriers, of a cam-wheel shaft, a latch mounted on the shuttle-carrier, a cam-wheel on said shaft, and a time-controlled trip on the cam-wheel shaft to act in conjunction with the cam-wheel and the latch, as and for the purposes described.

14. In a wire-fence-weaving machine, the combination with a shuttle-carrier, a shuttle, and warp-carriers, of a latch mounted on the shuttle-carrier, a cam-wheel shaft journaled in said carrier, a cam-wheel on the shaft and provided with a stud, a trip arranged to move the latch, and one or more time-collars between the cam-wheel and the trip, as and for the purposes described.

15. In a wire-fence-weaving machine, the combination with a shuttle-carrier, a shuttle, and a series of warp-carriers, of a cam-wheel shaft on the shuttle-carrier, a latch on the shuttle-carrier, a cam-wheel on said shaft, a time-trip between the cam-wheel and the latch, a feed-shaft journaled on the shuttle-carrier, a clutch-controlled gear on said feed-shaft, a drive-chain engaging with the cam-wheel shaft and with the clutch-controlled gear of the feed-shaft, and a shipper-rod between the latch and the clutch-controlled gear of the feed-shaft, for the purposes described, substantially as set forth.

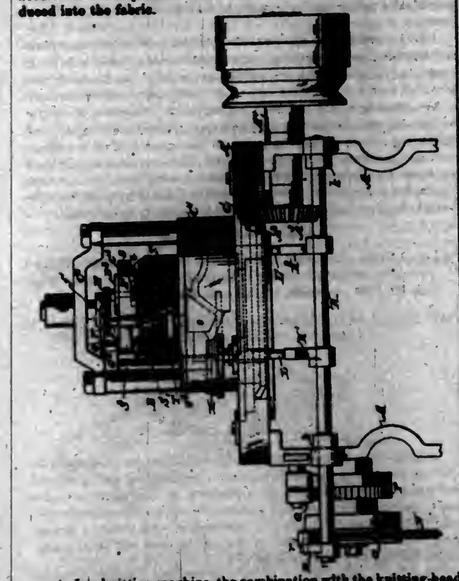
16. In a wire-fence-weaving machine, the combination of a main supporting-frame, one side of which is provided with semicircular openings and the other side having openings along its medial line and a groove on its inner side, a shuttle-carrier flanged to engage the groove of one side of said frame and resting upon the other side thereof, track-bars one of which engages with the flange on one side of the shuttle-carrier, a series of warp-carriers journaled in the main frame contiguous to the shuttle-carrier, a shuttle, and a feed mechanism for the shuttle-carrier which engages with the track-bars, as and for the purposes described.

17. In a wire-fence-weaving machine, the combination with a series of warp-carriers, a traveling shuttle-carrier, and a shuttle, of a shuttle-driving shaft on said carrier, a feed mechanism for the shuttle-carrier, a drive-chain, a power-shaft having a reversing mechanism for its pulleys, a hand-lever associated with the reversing mechanism, a balanced lever, and a reversing-rod connected with the balanced lever and the hand-lever and having dogs arranged in the path of the shuttle-carrier, for the purposes described, substantially as set forth.

18. In a wire-fence-weaving machine, the combination with a series of warp-carriers mounted within a stationary frame, of a shuttle-carrier, a shuttle mounted in said carrier and supporting a weft-bobbin, mechanism for imparting intermittent feed to said carriage, mechanism for imparting motion to the shuttle and the warp-carrier with which the shuttle may be temporarily in alinement, a timing device associated with the mechanism for rotating the shuttle and warp-carrier to regulate the number of rotations thereof, a latch traveling with the carriage to lock the same in the intervals between its feed and lying in the path of the timing device to be actuated thereby at the completion of the desired number of rotations of the shuttle and warp-carrier, and shifting devices controlled by the latch to throw the feed mechanism into operation and renew the feed of the shuttle-carrier, substantially as described.

19. In a machine for weaving wire fabrics, the combination of a series of warp-carriers arranged in the same horizontal plane in a suitable frame, a traveling carriage having a shuttle for a weft-bobbin, a driving-shaft with a reversing-gear, a driving connection from said driving-shaft for feeding the carriage and rotating the shuttle and warp-carrier, a shifting rod with stops in the path of the traveling carriage, and a reversible clutch with which the shifting rod is connected, substantially as described.

20. In a machine for weaving wire fabrics, the combination of a series of warp-carriers arranged in the same horizontal plane in a suitable frame, a traveling carriage mounted to travel in a plane at one side of said warp-carriers, a shuttle mounted in said carriage and having a weft-bobbin, a driving-shaft, pulleys mounted thereon, a shiftable clutch between said pulleys, a driving connection between the driving-shaft and the carriage for feeding the latter and for rotating the shuttle and warp-carrier in the intervals between the feed of the carriage, a shifting rod supported above the warp-carriers and the carriage and having stops in the path of the carriage, and a lever fulcrumed on the frame and operatively connected with the shifting rod and the clutch, substantially as described.



21. In a machine for weaving fence fabrics, the combination with a traveling carriage, a series of warp-carriers, a shuttle, and a driving connection, of a driving-shaft by which the driving connection is operated, the pulleys on said shaft, a clutch, a lever connected with the clutch, an overbalanced swinging arm opposite to the lever, a shiftable rod attached to said lever and the swinging arm to hold the rod and lever in their adjusted positions, and stops carried by the rod in the path of the carriage, substantially as described.

604,100. KNITTING-MACHINE. FRANK A. WILDMAN, Norristown, Pa., assignor to the McMichael & Wildman Manufacturing Company, of Pennsylvania. Filed May 13, 1897. Serial No. 636,332. (No model.)

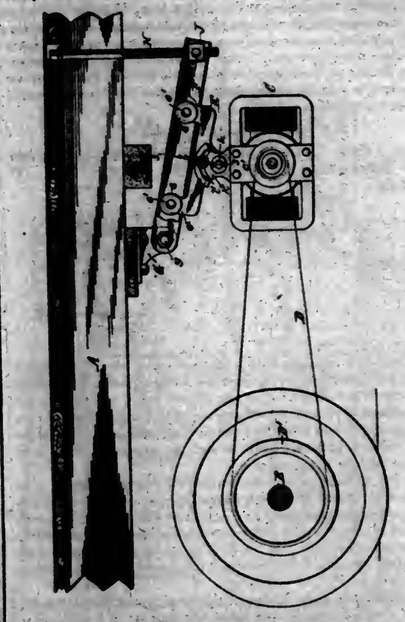
Claim.—1. The combination with the knitting-head of a knitting-machine, of a movable thread-carrier having a thread passage-way, a clamping-piece adjacent to the thread-carrier, adapted, when the carrier is moved into a certain position, to clamp the thread and hold it against passage to the needles, operating-levers connected so that when one is projected the other is retracted, power-transmitting connections between the operating-levers and the thread-carrier whereby the operation of said levers will move the thread-carrier to clamp or release the thread, and devices controlled by pattern mechanism for operating the levers.

2. The combination with the knitting-head of a knitting-machine, of a frame D' arranged adjacent to the needles thereof, a rotatable thread-carrier D journaled on the frame D', and provided with a thread passage-way extending through it, through which the thread may pass freely to the needles when said passage-way is presented to them, a clamping-wall d' on the frame D' adjacent to the thread-carrier adapted to hold and break the thread when the thread-carrier is turned to move its thread passage-way away from the needles, a pinion E carried by the carrier D, a second pinion F adjacent to the pinion E and engaging the teeth thereof, and means controlled by pattern mechanism for operating the pinion F embracing levers I, J, so connected that when one is retracted the other is projected, and connections between the levers I, J, and the pinion F.

3. In a knitting-machine, the combination with the knitting-head having the vertical and horizontal needles, the movable thread-carrier D for introducing an auxiliary thread to the needles, in addition to the ordinary threads which compose the fabric, means for operating the thread-carrier D, embracing a pinion F, the operating-cam for the vertical needles, a rod S carried by the said cam and bearing against the pinion F and adapted to be depressed thereby when the pinion is turned to operate the thread-carrier, whereby the vertical needles will be depressed while the auxiliary thread is being introduced into the fabric.

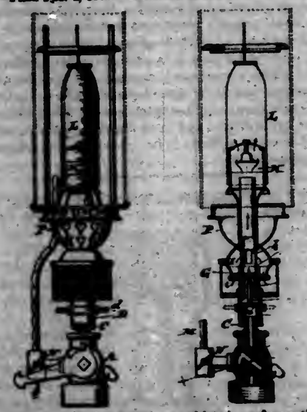
4. In a knitting-machine, the combination with the knitting-head and its needles, and the usual thread-guide for guiding the body-thread to the needles, of the devices for introducing an auxiliary or reinforcing thread consisting of a block D' located adjacent to the needles and provided with a recess, a movable perforated thread-carrier located in the recess of said block through the perforation *d* of which the auxiliary thread passes, and means controlled by pattern mechanism for operating said thread-carrier to clamp and release the auxiliary thread between said carrier and a wall of the recess in said block.

5. In a knitting-machine, the combination with the knitting-head and its needles, and the usual thread-guide for guiding the body-thread to the needles, of the devices for introducing an auxiliary or reinforcing thread consisting of a rotary perforated thread-carrier D, through the perforation *d* of which the auxiliary thread passes, a clamping frame or wall located adjacent to said carrier and adapted to clamp the thread which passes through the perforation *d* between it and the carrier when said carrier is turned, and means controlled by pattern mechanism for turning said rotary carrier to clamp or release the auxiliary thread, which passes through the perforation thereof.



604,101. ELECTRIC-LIGHTING APPARATUS FOR CARS. EDWARD WILHELM and WILLARD F. RICHARDS, Buffalo, N. Y., assignors to Charles H. Gould, same place. Filed Oct. 23, 1897. Serial No. 656,160. (No model.)

Claim.—1. The combination with a railway-vehicle and its axle, of an inclined track or way arranged on the under side of the vehicle, a dynamo supported on said track and capable of moving thereon toward and from said axle, and a frictional driving mechanism whereby the dynamo is driven from said axle, substantially as set forth.

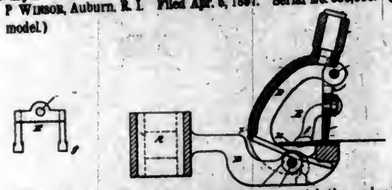


2. The combination with a railway-vehicle and its axle, of an inclined track or way arranged on the under side of the vehicle, means whereby the inclination of the track or way can be adjusted, a dynamo supported on said track or way and capable of moving thereon toward and from the axle, and a frictional driving mechanism whereby the dynamo is driven from said axle, substantially as set forth.

3. The combination with a railway-vehicle and its axle, of an inclined track or way arranged on the under side of the vehicle and pivoted at one end thereto, means for adjusting the opposite end of the track vertically, a dynamo supported on said track and capable of moving toward and from said axle, and a frictional driving mechanism whereby the dynamo is driven from said axle, substantially as set forth.

4. The combination with a railway-vehicle and its axle, of an inclined track or way arranged lengthwise on the under side of the vehicle, a carriage mounted on said track, a dynamo adjustably attached to said carriage, and a frictional driving mechanism whereby the dynamo is driven from said axle, substantially as set forth.

604,102. GAS-BURNER. THOMAS WILSON, Philadelphia, Pa., assignor to the Pennsylvania Globe Gas Light Company, of Pennsylvania. Filed Feb. 1, 1897. Serial No. 621,420. (No model.)



Claim.—1. In a gas-burner, the combination of a vertically movable and rotatable Bunsen burner having a gas-aperture at the bottom, a main gas-pipe leading to the Bunsen burner, a fixed needle-valve arranged upon the main gas-pipe and extending into the aperture in the Bunsen burner, an air-valve carried by the Bunsen burner, lateral projections from the Bunsen burner below the air-valve for rotating it, a main burner loosely supported upon the Bunsen burner, an incandescing mantle supported over the main burner, and means to hold the main burner and mantle against rotation when adjusting the Bunsen burner upon the needle-valve.

2. In a gas-burner, the combination of the main gas-pipe and valve, a by-pass leading therefrom, an auxiliary igniting-pipe leading from the by-pass to the main burner, a fixed needle-valve arranged upon the gas-pipe, a Bunsen burner adjustable vertically upon the fixed needle-valve, and a main burner supported by the Bunsen burner and held against rotation by the auxiliary igniting-pipe.

3. In a gas-burner, a stationary needle-valve secured centrally

upon a perforated thimble fitted to the gas-pipe, a Bunsen burner having a small central gas-orifice at the bottom receiving the point of the needle-valve and provided with a screw-threaded adjusting connection upon the thimble whereby it may be rotated and thus vertically adjusted upon the needle-valve, a mantle adapted to be heated by the gas from the Bunsen burner, screened air-passages to lead air to the Bunsen burner adapted to be rotated with the Bunsen burner, and means to hold the mantle stationary when the Bunsen burner is rotated during adjustment.

604,103. CLOTH-CLAMP FOR TEXTILE MACHINERY. ROBERT P WINSOR, Auburn, R. I. Filed Apr. 6, 1897. Serial No. 630,961. (No model.)

Claim.—1. In a cloth-clamp, the combination with the under jaw having a cloth-support of an upper jaw swinging laterally to expose said support and comprising an arm pivoted below said support and a gripping-pawl pivoted to said arm above said support and a spring pressing against said arm which restores the upper jaw to normal position, and acts upon said pawl through the medium of said arm to hold the cloth by spring-pressure.

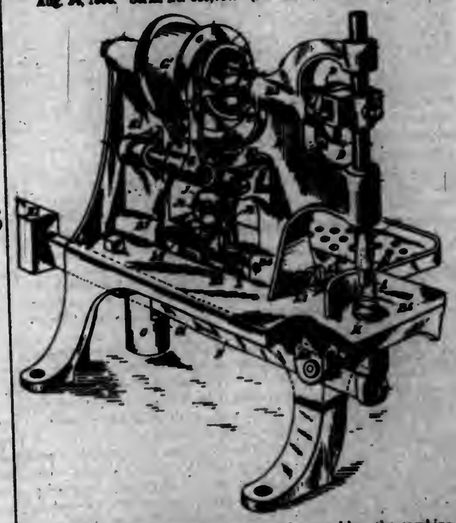
2. In a cloth-clamp, the combination with the cloth support of an arm pivoted below said support, a gripping-pawl pivoted to said arm above said support and having a limited travel with the cloth in the direction of stretch, and a spring, acting upon said pawl through the medium of said arm to hold the cloth by spring-pressure and to determine the strain to which the arm is subjected by the toggle action of the pawl.

3. In a cloth-clamp, the combination with a slotted cloth-support of a curved arm pivoted below said support, a gripping-pawl pivoted to said arm above said support, a spring acting upon said pawl through the medium of said arm to hold the cloth by spring-pressure and a controller swiveled to said pawl and having fingers with enlarged ends which cross the warp and equalize their pressure while they rest upon the cloth, and drop through the slots in the cloth-support to locate the grip of the pawl near the selvage.

4. A cloth-clamp for textile machinery having an upwardly-pressing spring, a laterally-swinging lever-arm against which said spring presses, and which converts such pressure into downward stress, a gripping-pawl pivoted to the upper end of said arm and provided with a suitable controller, a cloth-support beneath said pawl, and stops limiting the travel of said pawl with the cloth in the direction of its stretch and arresting said arm in its normal position, substantially as hereinbefore specified.

604,104. NON-REFILLABLE BOTTLE. ALVIN H. WOODARD, Mansfield, Ohio. Filed July 21, 1897. Serial No. 645,433. (No model.)

Claim.—1. A vessel having a valve-seat in its neck, and a by-pass, a plate corresponding to the opening in the mouth of the vessel, a tube secured to said plate and projecting downwardly into the neck, a valve adapted to seat in the neck of the vessel, and provided with a guide-stem projecting upwardly within the tube, and an impenetrable packing placed in the neck of the bottle above the plate to prevent the withdrawal of the plate and valve, substantially as set forth.

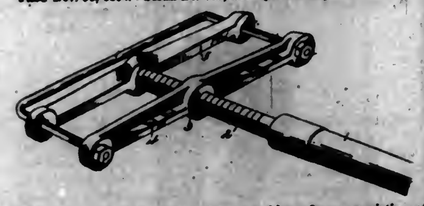


2. A vessel having a valve-seat in its neck, and a by-pass, a plate corresponding to the opening in the mouth of the vessel, a tube secured to said plate and projecting downwardly into the neck, and provided with a longitudinal slot, a valve adapted to seat in the neck of the vessel and provided with a guide-stem projecting upwardly within the tube, and having a pin to engage the slot, a spring inclosed within the tube and confined between the upper end of the valve-stem and the plate, disks secured to said tube and having unalined apertures, and a packing of impenetrable material placed in the neck of the vessel above the plate to prevent the withdrawal of the tube and its connected or associated parts, substantially as set forth.

604,105. IMPLEMENT-HANDLE. ABRAHAM L. ADAMS, Bridgeport, Conn., assignor of one-half to George R. Hawes, same place. Filed July 30, 1896. Serial No. 557,612. (No model.)

Claim.—In a tool, the combination with a handle provided with a ferrule bent at an angle thereto, said ferrule having a longitudinal perforation, adapted to engage a plurality of tools each having a shank secured thereto adapted to enter the perforation of the ferrule and rotate therein, the angle of attachment of each shank to its tool being such that in the rotation of the tool the tool will lie at a constantly-varying angle to the handle.

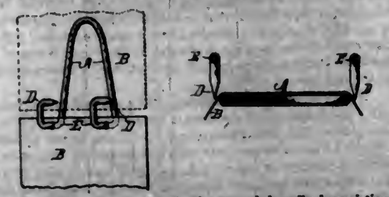
604,106. MACHINE FOR STAMPING SOLES OF BOOTS, SHOES, &c. ARTHUR ADCOCK, South Wigston, England, assignor of three-fourths to Benjamin Toone and John Wycliffe Black, same place. Filed Aug. 24, 1896. Serial No. 603,707. (No model.)



Claim.—1. In a stamping or embossing machine, the combination with the stamp, of a shaft, an eccentric thereon, clutch mechanism on the shaft, a ratchet-wheel and means between it and the said clutch, to place the latter in and out of action, and a slide, movable by the article to be stamped, to actuate the ratchet-wheel substantially as described.

2. In a stamping or embossing machine the combination with the stamp, of a shaft, an eccentric thereon for actuating the stamp, clutch mechanism on the shaft, a two armed lever, a ratchet-wheel to actuate the latter to place the clutch in and out of action and means for actuating the said ratchet-wheel and operated by the article to be stamped substantially as described.

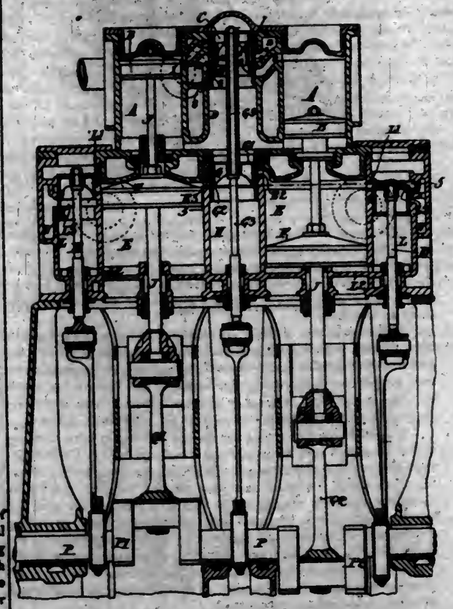
3. In a stamping or embossing machine the combination of a stamp and its spindle, an eccentric for actuating them, a shaft and clutch mechanism thereon, a lever for placing the latter in and out of action, a ratchet-wheel for actuating the said lever, a yielding tooth which when moved in one direction will partly rotate the ratchet-wheel and in returning will pass under it without actuating it substantially as described.



4. In a stamping or embossing machine, the combination of a stamp, a rotatable shaft, an eccentric thereon for actuating the stamp, a pulley loosely mounted on the shaft, a toothed clutch carried by the pulley, a pawl pivotally connected with the shaft adapted to engage with the tooth of the clutch, a pivoted lever having an inclined edge adapted to free the pawl from a tooth of the clutch as described, a ratchet-wheel, a slide movable by the article to be stamped, a connection between the slide and ratchet-wheel whereby the latter is actuated when the slide is moved in one direction, and a connection between the ratchet-wheel and the pivoted lever for the purpose set forth.

604,107. MOP-HOLDER. HERMAN A. L. RADE, Clyde, Ohio. Filed Nov. 30, 1897. Serial No. 660,393. (No model.)

Claim.—A mop-holder comprising an oblong frame consisting of the outer side and ends constructed of a single piece of rod metal threaded at its terminals, and the adjustable transverse bar 4, having a central threaded perforation and provided at its terminals with perforations receiving the ends of the frame, nuts arranged on the threaded portions of the ends of the frame and engaging the inner and outer faces of the bar 4, and detachably and adjustably securing the latter to the ends of the oblong frame, the movable bar provided at its ends with perforations receiving the ends of the frame, whereby the bar is guided on the latter, and a screw designed to be secured to the mop-handle, engaging the threaded perforation of the bar 5 and having its outer end swiveled to the movable bar, substantially as and for the purpose described.

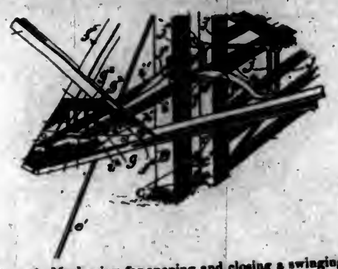


604,108. FILE FOR PRESCRIPTIONS. ALFRED H. COOK, Jr., Joliet, Ill. Filed Dec. 13, 1897. Serial No. 661,841. (No model.)

Claim.—The prescription-file shown and described consisting of a single piece of wire bent to form substantially a V-shaped body, and having its extremities or arms terminating in needle-points D, and bent backward toward said body so as to form loops E for holding prescriptions, said needle-points D being extended slightly beyond the line of said body and turned laterally from each other to be out of line with said body and leave a passage for the insertion of prescriptions, and so said loops or prescription-receptacles will be substantially parallel with each other substantially as and for the purpose set forth.

604,109. STEAM OR OTHER FLUID PRESSURE ENGINE. WILLIAM H. GREENWOOD, Bradford, England. Filed Sept. 16, 1896. Serial No. 605,908. (No model.)

Claim.—1. In a steam-engine, the combination with the cylinder and independent valve-chests, with ports opening communication with one of said valve-chests and the upper end of the cylinder, ports communicating between the other of said valve-chests and both ends of the cylinder, with an independent passage connecting the last-mentioned ports with each other and an exhaust-port, of a piston working in said cylinder, independent valves located in said valve-chests and controlling said ports, one to admit pressure to the upper end of the cylinder and the other to control the exhaust therefrom, and to control the by-pass from the upper to the lower end of the cylinder; substantially as described.



2. In a steam-engine the combination with the cylinder, and independent valve-chests, with ports opening communication with one of said valve-chests and the upper end of the cylinder, ports communicating between the other of said valve-chests and both ends of the cylinder, with an independent passage connecting the last-mentioned ports and an exhaust-port, of a piston working in said cylinder, valves controlling said ports and the pressure-reducer located in the passage between the upper and lower ends of the cylinder; substantially as described.

3. In a steam-engine, the combination with the cylinder, independent valve-chambers with ports communicating with one of said valve-chambers and the upper end of the cylinder and between the other of said valve-chambers and both ends of the cylinder with an independent passage connecting the last-mentioned ports and an exhaust-port, a piston working in said cylinder and valves controlling the said ports, of a pressure-reducing valve interposed between the ports communicating with both ends of the cylinder, with means for manually controlling the said pressure-reducing valve; substantially as described.

4. In a steam-engine the combination with the two cylinders arranged side by side, an intermediate valve-chest with ports opening communication between said valve-chest and the upper ends of both said cylinders, and independent valve-chests with ports opening communication between both ends of said cylinders and said independent valve chests, and pistons working in said cylinders, of a valve working in said intermediate valve-chest and controlling the admission of pressure to the upper ends of the cylinders alternately, and independent valves located in said independent valve-chests and controlling the ports leading from opposite ends of the cylinders to exhaust; substantially as described.

5. In a steam-engine the combination with the cylinders arranged side by side, the intermediate and independent valve-chest with ports leading from the intermediate valve-chest to the upper ends of both the cylinders and from the independent valve-chest to both ends of the cylinders and to exhaust, and a passage M in each of said independent valve-chests, of pistons working in said cylinders and valves working in said valve-chests, and controlling, respectively, the alternate admission of pressure to the upper ends of the cylinders and the alternate admission of pressure from the upper ends of said cylinders through the passages M, to the lower ends of said cylinders, and from the lower ends of said cylinders to exhaust; substantially as described.

604,110. SWINGING GATE. WILLIAM P. DAVIS, Warren, and HENRY J. ALEXANDER, Huntington County, Ind. Filed Nov. 15, 1897. Serial No. 658,580. (No model.)

Claim.—1. Mechanism for opening and closing a swinging gate, comprising a rocking actuator, and a double set of operating connections between the same and the gate with provisions for automatic alternation, whereby reciprocation of the rocker may be converted into a complete swing of the gate in one direction, substantially as described.

2. Mechanism for opening and closing a swinging gate, comprising a rocking actuator, and a pair of connector-bars coupled with the gate in different radial lines from the hinging-center thereof, said actuator and bars having coacting abutments and said bars having coacting cams to alternately disengage abutments thereof from abutments on the actuator, substantially as and for the purpose described.

3. Mechanism for opening and closing a swinging gate, comprising an elongated rocking actuator having a plurality of vertically-extending shoulders or abutments and a horizontally-extending shoulder or abutment, connector-bars coupled with the gate in different radial lines from its hinging-center and arranged to bear upon the horizontal shoulder or abutment adjacent to the vertically-extending shoulders or abutments, said bars having lateral projections for engagement with the latter and shoulders for engagement with the horizontal shoulder of the actuator, and also having coacting cams to effect alternate disengagement of the bars from said horizontal shoulder, substantially as described.

4. Mechanism for opening and closing a swinging gate, comprising an elongated actuating rocker-frame obliquely disposed on elevated supports and having at or near its middle lower portion a horizontally-extending edge or shoulder and a plurality of vertically-extending abutments or shoulders adjacent thereto, a pair of connector-bars set on edge to rest upon the said horizontal shoulder and having teeth or shoulders to alternately engage the same for movement of said bars in one direction by the actuator, the bars having coacting cams to alternately disengage them from the said horizontal shoulder and also provided with lateral abutments or projections for engagement with the vertical abutments of the actuator to effect movement of the bars alternately in a direction opposite to that produced through their engagement with the horizontal shoulder, and arms projecting laterally and divergently from the gate at the hinged end thereof and pivotally connected with the bars respectively.

5. Mechanism for opening and closing a swinging gate, comprising a rocking actuator, a double set of operating connections between the same and the gate with provisions for automatic alternation whereby reciprocation of the rocker may be converted into a complete swing of the gate in one direction, and a latch on the gate coupled with the said connections, substantially as described.

6. Mechanism for opening and closing a swinging gate, comprising a rock-shaft on the hinge end of the gate and projecting laterally therefrom and having a plurality of arms, a bracket fastened on the gate and supporting the outer end of said rock-shaft, said bracket comprising a member extending downwardly to constitute a guard for a pendent arm of the rock shaft, a latch on the gate operatively connected with an arm of the rock-shaft, a rocking actuator, and suitable connections between the same and the said rock-shaft.

604,111. HAIR-TONIC. LOUISA EDWARDS, Florence, Colo. Filed Dec. 31, 1897. Serial No. 665,173. (No specimens.)

Claim.—A composition of matter for the purpose named, comprising a decoction of mountain-sage, glycerin, tincture of lobelia, prickly-pear juice, tincture of capsicum, sweet-oil, and alcohol, combined, substantially as and in the proportions specified.

604,112. BOX OR CAN. ALAN R. FERGUSON, Baltimore, Md., assignor to Henry F. Miller and George Miller, same place. Filed Oct. 9, 1897. Serial No. 654,654. (No model.)

Claim.—The combination with a receptacle having a neck at one end and a fixed perforated disk at the end of said neck, of a fixed cap on said neck having an outlet-opening and a slot communicating with said opening, a disk within the cap and adapted to form a measuring-chamber with which said outlet-opening in the cap is adapted to communicate, said disk having a hole to aline with the hole in the fixed disk, a flange on said disk to close the outlet-opening of the cap and a lip on said disk projecting through said slot in the cap and serving as a handle and a spout, substantially as set forth.

604,113. PAPER-SERVING MACHINE. CHARLES PFEIFER, Milwaukee, Wis., assignor of one-half to Herman Segnitz, same place. Filed May 31, 1895. Serial No. 551,329. (No model.)

Claim.—1. A paper-serving machine comprising a suitable casing or frame, a serving-roller journaled therein, and a retaining device or fastening for holding a package or bunch of sheets at one end or edge, constructed and arranged with reference to said roller and the point of discharge of the paper to hold the package in a curved position or form around or against said roller, substantially as and for the purposes set forth.

2. A paper-serving machine comprising a casing, having a delivery slot or aperture, a serving-roller journaled in said casing, and a retaining device constructed and arranged with reference to said serving-roller and delivery-slot to hold a bunch or package of sheets by one end or edge in a curved form around said roller with each inner sheet of the package projecting at the opposite end or edge from the retaining device beyond the next sheet, substantially as and for the purposes set forth.

3. A paper-serving machine comprising a suitable casing provided with a discharge slot or aperture, a serving-roller journaled in said casing above said discharge-aperture, a retaining device or fastening constructed and arranged with reference to said serving-roller so as to hold a package or bunch of sheets by one end or edge suspended in a curved form upon said roller in position to be advanced thereby through said discharge-aperture, substantially as and for the purposes set forth.

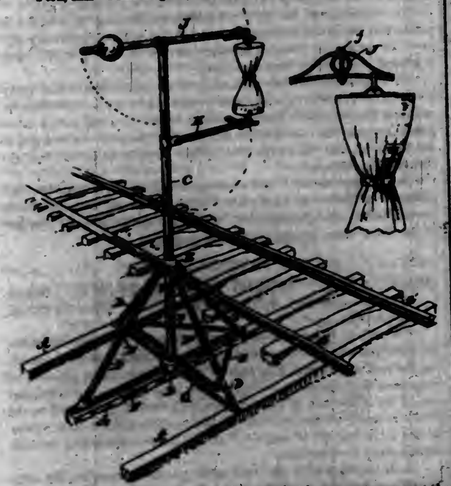
4. A paper-serving machine comprising a suitable casing provided with a delivery slot or aperture, a serving-roller journaled in said casing, and a retaining device or fastening constructed and arranged with reference to said roller and delivery-aperture so as to hold a package or bunch of sheets by one end or edge in a curved form upon or against said roller with each inner sheet projecting at the end or edge opposite said retaining device beyond the next sheet, said casing having an inclined wall next to said delivery-aperture serving to support and guide the free ends of the sheets thereto, substantially as and for the purposes set forth.

5. A paper-serving machine comprising a suitable casing or frame, a serving roller journaled therein and provided with a coating or covering of material affording frictional engagement with the paper, and a retaining device or fastening constructed and arranged to hold a package or bunch of sheets in a curved position in contact with said roller, whereby the withdrawal of the inner sheet causes the roller to advance the next sheet sufficiently to be readily grasped, substantially as and for the purposes set forth.

6. A paper-serving machine comprising a casing provided with a delivery slot or aperture, a serving-roller journaled in said casing, a retaining device or fastening constructed and arranged to hold a package or bunch of sheets by one end or edge in a curved position or form around said roller, and means for turning said roller manually for starting a sheet through said delivery-aperture, substantially as and for the purposes set forth.

7. A paper-serving machine comprising a casing provided with a delivery slot or aperture, a serving-roller journaled in said casing, and a retaining device or fastening constructed and arranged to hold a package or bunch of sheets by one end or edge in a curved position or form around said roller, said casing having an opening at the end of said roller arranged to expose to view the edges of a part or all of the sheets of paper thereon, substantially as and for the purposes set forth.

8. A paper-serving machine comprising a suitable casing or frame, a serving-roller journaled therein, a retaining device or fastening constructed and arranged to hold a package or bunch of sheets by one end or edge in a curved position or form around said roller, and a detent constructed and arranged to prevent the backward rotation of said roller, substantially as and for the purposes set forth.

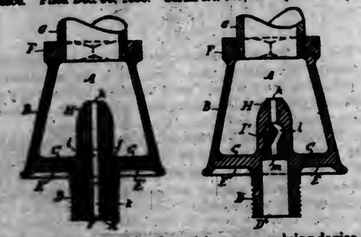


604,114. NUT-LOCK. WALTER A. GARRISON and ROBERT GOTLIEB, Lamar City, Texas. Filed May 15, 1897. Serial No. 637,092. (No model.)

Claim.—1. A nut-lock comprising a nut having throughout the entire length of its bolt-opening threads of even pitch with the bolt to which the nut is to be applied, said nut being provided with a recess dividing it into two integrally-connected sections or members and forming a web arranged at the bolt-opening in position to engage a bolt, whereby when the outer section or member of the nut is jammed upon the inner section or member, the web will be crowded inward for mutilating the threads of the bolt, substantially as described.

2. A nut lock comprising a nut having throughout the entire length of its bolt-opening threads of even pitch with the bolt to which the nut is to be applied, said nut being provided with an annular recess extending around the same, dividing the nut into two sections or members and forming an annular connecting-web located at the bolt-opening in position for engaging a bolt, whereby when the outer section or member is jammed upon the inner one, the web will be crowded inward for mutilating the threads of the bolt, substantially as described.

604,115. MAIL-BAG CRANE. WILLIAM I. HATFIELD, Green Fork, Ind. Filed Aug. 26, 1897. Serial No. 649,433. (No model.)



Claim.—1. A vertical, revolvable post having arms to support the mail-bag in the path of the gripper-arm of a passing mail-car and having a pair of springs of predetermined resistance attached to fixed supports outside of the post and to opposite sides of the post to hold the post against rotation from any force below the predetermined resistance of the springs.

2. A vertical, revolvable post mounted on ball-bearings and having arms to support a mail bag in the path of the gripper-arm of a passing mail-car, a pair of arms secured to the post on opposite sides from each other and a pair of springs connecting the ends of the arms with a fixed support, all substantially as shown.

3. A vertical, revolvable, tubular post a base-plate to support the post and having ball-bearings between the plate and the post, a collar above the base-plate supported by diagonal braces and having ball-bearing contact with the post, a bar passing transversely through the post, spiral springs connected by eyebolts with the ends of the bar, the opposite ends of the springs being fastened to a fixed support, and arms projected laterally from the top portion of the post whereby a mail-bag supported by said arms will cross the path of the gripper-arm of a passing mail-car, all substantially as described and for the purpose specified.

4. The combination, with a vertical, revolvable post held by springs against rotation up to a predetermined resistance, of arms to hold a mail-bag in the path of the gripper-arm of a passing car, and clamps on the ends of the arms consisting of an upper and lower plate of spring metal with meeting outer ends, fastened to the arm by a bolt passing through the arm and through the upper and lower plate, substantially as shown.

604,116. FUEL-GAS MIXER. ANDREW KRIDER and JOHN COTLE, Indianapolis, Ind., assignors to William Langenkamp, Jr., same place. Filed Dec. 30, 1895. Serial No. 573,776. (No model.)

Claim.—1. The combination with a gas-supplying device having a duct therethrough, of a drill-obstructer, situated within said duct, the said obstructer provided with a gas-passage, as set forth.

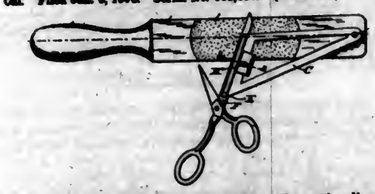
2. The combination with a gas-supplying device having a duct therethrough, and one part of the said duct of greater diameter than the balance thereof, a drill-obstructer adapted to fit within the enlarged portion of the duct, the said obstructer provided with a gas-passage, substantially as set forth.

3. The combination with a gas-supplying device having a duct therethrough, one part of said duct somewhat enlarged, and provided with a screw-thread for a part of its length, a drill-obstructer situated within the enlarged part of the duct, and a screw-plug to fit the threaded part of the duct, the obstructer and plug, each provided with a gas-passage, as set forth.

4. In a gas-mixing device, the combination with a gas-supplying device having a duct therethrough for the passage of a combustible fluid, of a drill-obstructer situated in line with said duct, said obstructer provided with a crooked bore.

5. In a gas-mixing device, the combination with a gas-supplying device having a duct therethrough for the passage of a combustible fluid, and a cylindrical drill-obstructer provided with a crooked bore, said drill-obstructer being rotatably supported within said duct and having its bore arranged to communicate with the duct of said mixer.

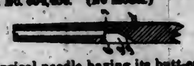
604,117. SEWER-VALVE. ZACHARIAH LATHROP, New York, N. Y., assignor to Charles R. Higgins, same place. Filed Nov. 19, 1897. Serial No. 659,002. (No model.)



Claim.—1. A sewer-valve constructed for use with hub-and-spigot pipes and having the valve casing with spigot C at one end, and at the opposite end the hub A to receive the spigot C of the connecting-pipe, and provided with shoulder B at the bottom, the collar D with valve-tube E extended therefrom and formed with inclined end to provide the valve-seat, as set forth, the lead packing M be-

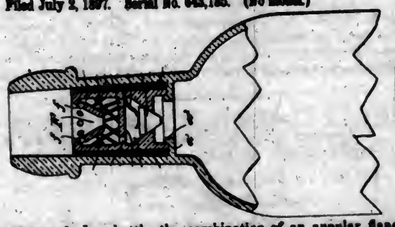
tween the margin of the collar and the inner wall of the hub, the valve G hinged to such tube to fit the seat, a hand-hole with cover J in the side of the casing above such valve, and a chamber, between such cover and valve-seat, of greater width than the pipe, to permit the free movement of the valve, substantially as herein set forth.

2. A sewer-valve constructed for use with hub-and-spigot pipes, and comprising the valve-casing with spigot C at one end, and at the opposite end the hub A to receive the spigot C of the connecting-pipe, and provided with shoulder B at the bottom, the collar D having marginal lead packing M, and the valve-tube E projected through the shoulder and made smaller than the same, with the hinge-lugs F formed thereon and adapted to pass through the shoulder, as set forth, the valve G having leg H fitted detachably between the lugs F, the pivot-pin A extended through the lugs to engage the same detachably, and the hand-hole with cover J in the side of the casing above such valve, the whole arranged and operated substantially as herein set forth.



604,118. SCISSORS-SHARPENER. HANS C. LARSEN, Newman, Cal. Filed Jan. 6, 1896. Serial No. 575,037. (No model.)

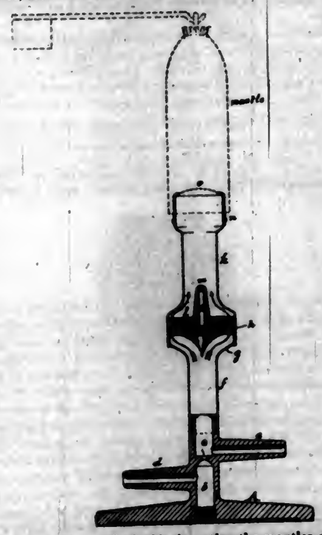
Claim.—1. The combination with a bar and an abrading-block fixed thereto, of a plate pivoted at one end to the bar to swing in a plane parallel to the working face of the block and having a projection extending toward the working face of the block, and means for clamping against said projection a blade to be sharpened.



2. The combination with the handled bar, of the abrading-block secured in the middle portion of the bar, the plate pivoted to the bar at the end opposite the handle and provided with the lip, and the adjustable spring adapted to coact with said lip in holding a blade, substantially as set forth.

604,119. SURGICAL NEEDLE. MILTON H. LOWE, Jeffersonville, Ind., assignor of one-half to Theo Russell, West Baden, Ind. Filed Oct. 7, 1897. Serial No. 654,459. (No model.)

Claim.—A surgical needle having its butt-end tapered from the thread-notch to the rear extremity thereof, a transverse notch in said shank adjacent to the tapered butt and forming an inclined face, 5, and an abrupt shoulder, 6, which constitutes a seat for a knotted thread, an axial bore or passage in the butt and opening into the notch at one side of the inclined face thereof, and a groove on the inclined face of the notch and arranged in line with the axial bore or passage, substantially as described.



604,120. BOTTLE. ANTON MARKANOVICH, New York, N. Y. Filed July 2, 1897. Serial No. 643,185. (No model.)

Claim.—1. In a bottle, the combination of an annular flanged shelf formed in the neck thereof and a cylindrical casing resting upon said shelf and tightly secured within the neck, a network of glass in the casing, said casing having the inlet thereto normally closed by means of a spring-pressed cork valve and having the outlet therefrom partly closed by means of a downwardly-extended funnel, said funnel having perforations leading therethrough for discharge of fluid from the cylinder, substantially as shown and described.

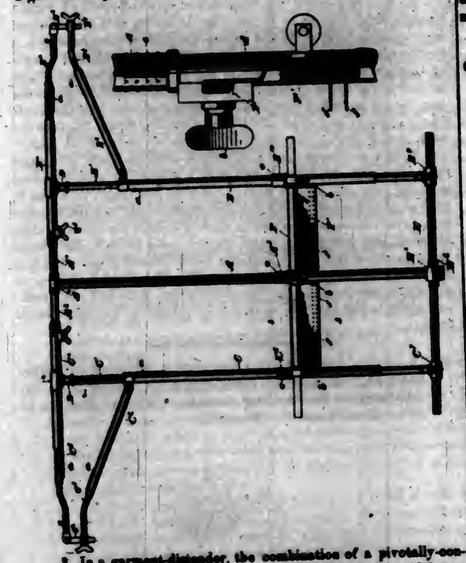
2. In a bottle-closing device, the combination of a cylindrical casing having two recesses therein which are separated by means of a perforated partition, the lower recess being normally closed by means of a spring-pressed cork valve and the upper recess being partly closed by means of a perforated funnel, this latter recess containing a network of fine glass, all parts of the cylinder being formed integrally with each other, and a bottle having an annular shelf in the neck thereof for engagement with the said cylinder, and means for securing the cylinder to the neck, substantially as shown and described.

604,121. METHOD OF INCINERATING INCANDESCENT GAS-MANTLES AND APPARATUS THEREFOR. THOMAS J. MEEHAN, Brooklyn, N. Y., assignor to Charles H. Hoyt, New York, N. Y. Filed June 11, 1897. Serial No. 640,305. (No model.)

Claim.—1. The method of incinerating the mantles of incandescent gas-burners, consisting in suspending or supporting the mantle and subjecting it to the heat of an internal flame while the latter is caused to rotate about the axis of the mantle.

2. An apparatus for incinerating the mantles of incandescent gas-burners, consisting of a support for the mantle, and means for subjecting the mantle to the heat of an internal rotating flame.

3. A gas-burner having a vertical flame-forming tip adapted to rotate around its own center, in combination with a stationary support and means for rotating the tip, whereby in operation the flame is caused to rotate on its own center.



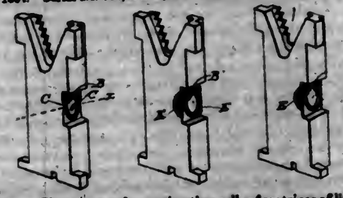
4. A blast gas-burner consisting of a vertical flame-forming tip adapted for rotation around its own center, a base provided with inlet-ports for air under pressure and gas, and a rotating device interposed between the base and tip and adapted to cause the rotation of the latter around its own center by the movement of air and gas through the apparatus.

5. An apparatus for incinerating incandescent gas mantles, consisting of a stationary support for the mantle, and an atmospheric burner having its tip adapted to rotate and produce axial rotation of the flame when ignited within the mantle.

604,122. GARMENT DISTENDER AND DRIER. PATRICK O'TRAINE, New York, N. Y. Filed Mar. 12, 1897. Serial No. 627,155. (No model.)

Claim.—1. In an adjustable and collapsible garment-distender, the combination of center and side bars, means for adjustably connecting the said center and sides bars at their lower ends, a plurality of cross-bars B^4 C^4 pivotally and adjustably connected to the center bar and to the upper end of the side bars, and bars B^5 C^5 pivoted to the side bars and in connection with the last-mentioned cross-bars, whereby the cross-bars B^4, B^5 and C^4 C^5 constitute arm-distending devices, substantially as described.

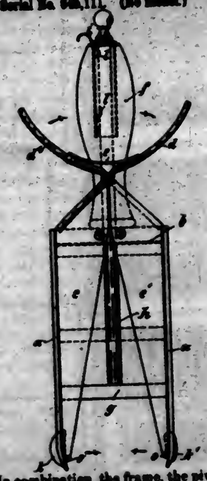
2. In an adjustable and collapsible garment-distender, the combination of a middle main bar and side bars, of collapsible arm-distenders each comprising a plurality of bars, one pivoted to a side bar and the other pivoted both to a side bar and to the main bar, means for adjusting the arm-distenders laterally independently of the expansion of the frame, and adjustable means for retaining the skirt of a garment in place.



3. In a garment-distender, the combination of a pivotally-connected collapsible frame, a cross-bar F adjustable upon the said frame, means carried by the said cross-bar for retaining the lower edge of the garment in place and means whereby the frame may be collapsed without effecting a movement of the cross-bar.

4. In a garment distender and drier, the combination of a plurality of side bars, a movable bar A, adjustable arm-distenders connected to the side bars and to the movable bar A, a pivotal connection intervening between the arm-distenders and the upper end of the movable bar A whereby the said distenders may be collapsed toward their centers, and means for retaining the parts against movement around their pivots.

5. In an adjustable and collapsible garment-distender, the combination of a longitudinally-movable main bar, side bars adjustably connected therewith, longitudinally-adjustable arm-distenders each comprising a plurality of rods, one of the rods of each of said arm-distenders being pivoted to a side bar and another of the rods of each of said arm-distenders being pivoted to a side bar and to the main bar and means for adjusting the arm-distenders laterally independently of the expansion of the frame.



6. In an adjustable and collapsible garment-distender, the combination of a longitudinally movable main bar and side bars adjustably connected therewith, each of said side bars comprising a plurality of members adjustable with relation to each other, longitudinally-adjustable arm-distenders each comprising a plurality of rods, one of said rods of each of the said arm-distenders being pivoted to one member of a side bar and another of the said rods of each of said arm-distenders being pivoted to a second member of a side bar and to the main bar and means for adjusting the arm-distenders laterally at both ends independently of the expansion of the frame.

604,123. PROCESS OF RENEWING MATRICES. BYRON REED, San Francisco, and BENJAMIN W. STURGEY, Oakland, Cal. Filed Apr. 14, 1897. Serial No. 632,164. (No model.)

Claim.—The process of renewing the walls of matrices of line-type setting and casting machines, consisting in first coating the matrix-plate with a non-conducting substance; secondly, removing a section of the plate on the side of the matrix outside the wall; thirdly, immersing the plate in a metallic solution and depositing metal in place of the removed portion; and lastly, trimming and reducing the deposited metal to an even surface with the wall of the plate.

604,124. APPARATUS FOR REMOVING KUTTER, &c. HERMANN BLEM and HELLMUTH UHSON, Neubrandenburg, Germany. Filed July 19, 1897. Serial No. 645,111. (No model.)

Claim.—1. In combination, the frame, the pivoted clips movable transversely across opposite sides thereof, and flexible sheets of the full width of the frame connecting the ends of the clips with said frame, substantially as described.

2. In combination, the frame comprising the oppositely-arranged side pieces and the connecting-head, the pairs of clips pivoted to opposite sides of said head each pair having a tong-like movement, the adjustable stamp, and the flexible sheets connecting the end of each clip with the lower edge of the adjacent side piece, said sheets forming a supporting-bottom to said frame when said clips are open, substantially as described.

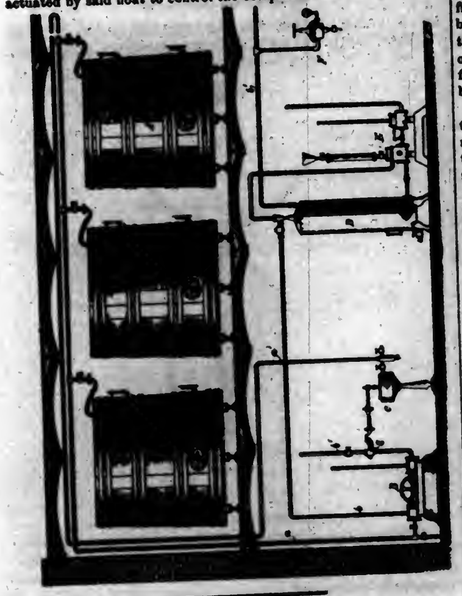
3. In combination the sides c, c', having a tong movement, the loops d, d' fixed thereto, the cross-pieces e, e' carried by the clips and the connecting-sheets K, K', fixed to said cross-pieces.

4. In combination, the frame, the sides thereof having their lower ends inwardly curved and tapered and the pivoted side pieces tapered toward their lower ends, said ends when said pieces are open being adapted to lie against said side frames at the curve thereof in the vertical plane of and above said ends, substantially as described.

5. In combination, the pivoted pieces having a tong movement, and the portions secured between said frame and said pivoted pieces forming complete bottom supports for the material held between said frames, substantially as described.

604,125. COLLECTING GAS FROM FERMENTING LIQUORS. JOSEPH SCHNEIBLE, New York, N. Y. Filed Sept. 2, 1897. Serial No. 650,257. (No model.)

Claim.—1. An apparatus for collecting the gas of fermentation comprising a collector, a compressor connected directly to the collector, a governor subject to the varying pressure of the gas supply and means actuated by said governor to control the compressor.



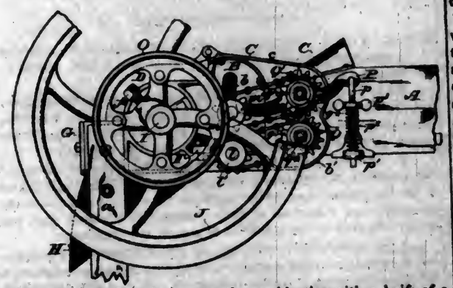
2. An apparatus for collecting the gas of fermentation comprising a collector, a compressor, a pipe to deliver gas from the collector to the compressor, a governor, subject to the varying pressure of the gas-supply and connected with the collector by a branch pipe and means actuated by said governor to control the compressor.

3. An apparatus for collecting the gas of fermentation comprising a collector, a compressor connected directly to the collector, a governor comprising a closed chamber and a float, a pipe connection between said closed chamber and the collector and means actuated by said float to control the compressor.

4. An apparatus for collecting the gas of fermentation comprising a collector, a compressor, a pipe to deliver gas from the collector to the compressor, a valve to control the compressor and a governor, subject to the varying pressure of the gas-supply and operatively connected to said valve.

5. An apparatus for collecting the gas of fermentation compris-

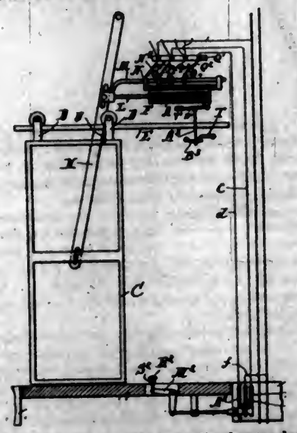
ing a collector, a compressor connected directly to the collector, a governor comprising a tank, a supplemental chamber closed and connected at the bottom to said tank and a float in said tank, a connection between said closed chamber and the collector and means actuated by said float to control the compressor.



604,126. SHOE-LACE FASTENER. FRED P. SCHULTZ, New York, N. Y. Filed May 26, 1897. Serial No. 638,204. (No model.)

Claim.—A shoe-lace fastener, composed of a single piece of spring-wire bent to form two adjacent coils for the passage of the lace, a loop connecting said coils, extending therefrom in a plane tangential thereto, and the forwardly-projecting, pointed ends, as and for the purpose set forth.

604,127. FEED-CUTTER. CASPER F. SEARCH, Oak Park, Ill., assignor to the Search Manufacturing Company, Sheboygan Falls, Wis. Filed June 5, 1897. Serial No. 639,504. (No model.)



Claim.—1. In a feed-cutter the combination with a knife of a shaft through which the knife is actuated, a driving or balance wheel mounted upon said shaft, a friction block inserted in a recess in the hub of said wheel, a set-screw threaded in the hub of the wheel and adapted to force said block against said shaft and to lock the wheel thereon, the outer face of said block being inclined toward the shaft in advance of the set-screw, whereby obstruction to the knife causes the set-screw to ride over said incline, release said block and permit the wheel to turn upon said shaft, substantially as and for the purposes set forth.

2. In a feed-cutter the combination with the knife, of a shaft through which the knife is actuated, a driving or balance wheel mounted upon said shaft and having an internally-recessed hub a friction-block inserted in the recess in said hub and retained therein by engagement with a shoulder in the hub, a screw set radially in the hub of the wheel and adapted to bear at its inner end against the outer face of said block, and when forced against it to hold the wheel from turning on said shaft, and a spring pressing forward against the back of said block, substantially as and for the purposes set forth.

3. In a feed-cutter the combination with the knife, of a shaft through which the knife is actuated, a driving or balance wheel mounted upon said shaft, a friction-block loosely fitted in a recess in the hub of said wheel and a screw set radially in said hub and adapted to force said block, when placed in the front end of the recess, against the shaft and to hold the wheel from turning thereon, said recess being extended behind the set-screw to receive the block when it is forced out of engagement with the set-screw by an obstruction to the knife, thereby allowing the wheel to turn upon said shaft without injury to the machine, substantially as and for the purposes set forth.

604,128. ELECTRICAL APPARATUS FOR OPERATING ELEVATOR-DOORS. HUMPHREY R. SMITH, Chicago, Ill., assignor to the Burdett Rowntree Manufacturing Company, same place. Filed Apr. 14, 1897. Serial No. 632,067. (No model.)

Claim.—1. In an apparatus for operating elevator-doors, the combination with a car, a series of coils and a core, said coils and core being relatively movable, of a door, connections between said door and movable part, a circuit for said coils, means for controlling said circuit from the car, and means actuated by the movement of said movable parts for successively and progressively controlling the circuits of said coils, as and for the purpose set forth.

2. In an apparatus for operating elevator-doors, the combination with a car, a series of coils and a core, said core and coils being relatively movable, of a door connections between said door and movable part, a circuit for said coils said circuit controllable from the car and means for successively cutting out of live circuit from a car said coils and progressively cutting in other of said coils, said means actuated by the movements of said movable part as and for the purpose set forth.

3. In an apparatus of the class described, a car a motor comprising a sectional solenoid and a core, said core and solenoid being relatively movable, a circuit for the coils of said solenoid, said circuit controllable from the car and means for successively cutting out of and progressively cutting into live circuit certain of the sections of said coils, said means actuated by the movements of said movable part in combination with a door and connections between said door and the movable part of said motor, as and for the purpose set forth.

4. In an apparatus of the class described, a car, a motor comprising a sectional solenoid, a movable core therefor, a circuit for the coils of said solenoid, said circuit controllable from the car and means for successively cutting out of said circuit and for progressively cutting into said circuit certain of said sections or coils, said means actuated by the movements of said core in combination with a door and connections between said door and core, as and for the purpose set forth.

5. In an apparatus of the class described, the combination with a series of coils and a core therefor, said coils and core being relatively movable, of a door, connections between said door and movable part, a circuit for said coils, means operated from the car for controlling said circuit and means actuated by the movements of said movable part for successively cutting out of said circuit and for progressively cutting into said circuit said coils, as and for the purpose set forth.

6. In an apparatus of the class described, the combination with a series of coils and core therefor, said coils and core being relatively movable, of a door, connections between said door and movable part, a circuit for said coils, means actuated by the movements of said movable part, for successively cutting out of live circuit said coils and progressively cutting in other of said coils, and means controllable from the car for opening and closing said circuit, as and for the purpose set forth.

7. In an apparatus of the class described, a series of coils and a core therefor, said coils and core being relatively movable and a circuit for said cores, means actuated by the movement of said movable part for successively cutting said coils out of live circuit and progressively cutting in other of said coils, in combination with a door and connections between said door and movable part, as and for the purpose set forth.

8. In an apparatus of the class described, a series of coils and a core therefor, said coils and core being relatively movable, a circuit for said coils, and means actuated by the movement of said movable part for successively cutting said coils out of live circuit and progressively cutting in other of said coils, in combination with a door and connections between said door and movable part, and means controllable from the car for opening and closing said circuit as and for the purpose set forth.

9. In an apparatus of the class described, a series of coils and a core therefor, said coils and core being relatively movable, a circuit for said coils, a switch arranged in said circuit for controlling the same, means operated from the car for controlling said switch, and means actuated by the movements of said movable part for successively cutting out of and progressively cutting into live circuit said coils, in combination with a door and connections between said car and said movable part, as and for the purpose set forth.

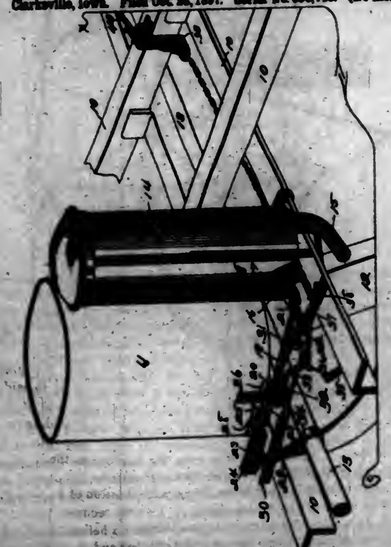
10. In an apparatus of the class described, a series of coils and a core therefor, said coils and core being relatively movable, a circuit for said coils, means for successively cutting out of live circuit said coils and progressively cutting in other of said coils, and means for arresting the cutting out of said coils near the end of the movement of said movable part while the progressive cutting in of other coils continues, in combination with a door and connections between such door and movable part, as and for the purpose set forth.

11. In an apparatus of the class described, a series of coils and a core, said coils and core being relatively movable, a circuit for said coils, means actuated by the movement of said movable part for successively cutting out of live circuit said coils and progressively cutting in other of said coils, and means for arresting the cutting out of said coils near the end of the movement of said movable part, while the progressive cutting in of other coils continues, in combination with a door and connections between such door and movable part, as and for the purpose set forth.

12. In an apparatus of the class described, a series of coils and a core therefor, said coils and core being relatively movable, a circuit for said coils, means for successively cutting out of live circuit said coils and progressively cutting in other of said coils, in combination with a door, connections between said door and movable part, means for magnetically combining said movable part at the limit of travel thereof as and for the purpose set forth.

13. In an apparatus of the class described, a series of coils arranged in series, a core mounted to move through said coils, a series of contact-segments respectively connected electrically to the windings of said coils, a series of contacts mounted to move with said core and adapted to complete the circuit of said coils through said segments, and means for opening and closing said circuit in combination with a door and connections between said door and core, as and for the purpose set forth.

14. In an apparatus of the class described, a series of solenoid-coils arranged in series, a core arranged to move through said solenoid, a series of segments respectively connected electrically to the windings of said coils, a bar connected to move with said core, and carrying a series of contacts adapted to contact with said segments and complete therethrough an electric circuit through a portion of said coils, in combination with a door and connections between said door and core, as and for the purpose set forth.



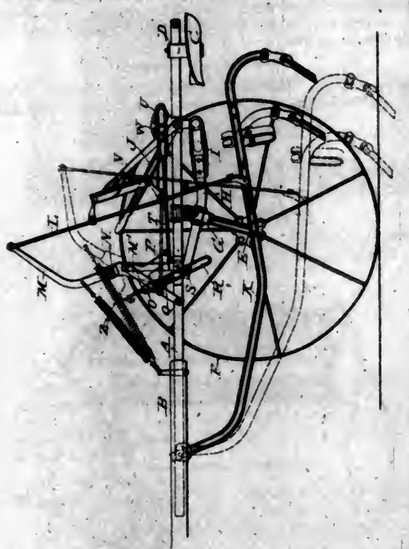
15. In an apparatus of the class described, a series of coils arranged in series, a core arranged to move through said coils, a series of segments respectively connected electrically to the windings of said coils, a bar connected to move with said core and carrying a series of contacts adapted to contact with said segments and complete therethrough an electric circuit through a portion of said coils, one of said contacts being movable with respect to said bar, and a step arranged in the path of movement of said movable contact, in combination with a door and connections between said door and core, as and for the purpose set forth.

16. In an apparatus of the class described, a motor comprising a relatively-movable solenoid and core, contacts for completing the circuit of said solenoid, said contacts arranged in pairs, a pair of hinged arms and an intermediate arm, said intermediate arm electrically connected to a line-wire, one pair of said contacts connected to another line-wire and the other pair of said contacts respectively connected to said hinged arms, and means carried by the car for making and breaking the circuit between said hinged arms and said intermediate arm at will in combination with a door and connections between said door and the movable part of the motor, as and for the purpose set forth.

17. In an apparatus of the class described a motor comprising a relatively-movable solenoid and core, a door and connections between said door and the movable part of said motor, in combination with an armature arranged to be actuated by the energization or de-energization of said solenoid, and a lock for the door operated by the actuation of said armature, as and for the purpose set forth.

18. In an apparatus of the class described, a motor comprising a relatively-movable solenoid and core, a door and connections between said door and the movable part of said motor, in combination with a pivoted latch arranged to lock said door, an armature arranged to be attracted by said solenoid when energized, and connections between said armature and latch for releasing the latter whereby the door is unlocked when said solenoid is energized, as and for the purpose set forth.

604,129. CORN-PLANTER ATTACHMENT. WALTER P SMITH, Clarksville, Iowa. Filed Oct. 26, 1897. Serial No. 656,718. (No model.)



Claim.—1. A pumpkin-seed-dropping attachment for check-row corn-planters, comprising in combination, a hopper designed to be secured to the machine-frame, a tube connecting the hopper with the runner of the corn planter, a seed-dropping valve in the pumpkin-seed holder having a notched disk, a ratchet-bar slidingly mounted and arranged to engage the said notched disk, means for connecting the rock-shaft of the corn-planter with the said ratchet-bar in such a manner as to cause the ratchet-bar to move the said disk one notch-space each time that said rock-shaft is operated so that when the said ratchet-bar has been moved a certain predetermined number of times the pumpkin-seed-dropping valve will be operated, and means for locking the said ratchet-bar, for the purposes stated.

2. A pumpkin-seed-dropping attachment for check-row corn-planters, comprising in combination, a hopper designed to be attached to the machine-frame, a tube connecting the hopper with the hollow leg of the planter, a seed-dropping valve having a disk with a ratcheted periphery, a ratchet-bar slidingly mounted, a spring for normally holding the ratchet-bar to its forward limit, means for limiting the

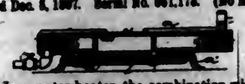
movement of the ratchet-bar, said ratchet-bar having an opening therein, an arm clamped to the rock-shaft of the corn-dropping mechanism and having two openings therein, a bar having a bifurcated end inserted in the said openings and connected with the ratchet-bar at its other end, a curved lever fulcrumed beneath the ratchet-bar and having a projecting end that is designed to enter the said opening in the ratchet-bar, a spring for holding the rear end of the lever downwardly so that the said projecting end of the lever will enter the said opening, and means for holding the rear end of the said lever elevated against the resiliency of the said spring, all arranged and combined substantially in the manner set forth and for the purposes stated.

3. A pumpkin-seed-dropping attachment for check-row corn-planters, comprising in combination, a seed-containing hopper designed to be attached to a corn-planter, a valve therein, having a ratcheted periphery, a tube for connecting the said hopper with the hollow leg of the planter, a ratchet bar slidingly mounted to engage the said ratcheted disk, means for limiting the movement of the said ratchet-bar, a spring for normally holding the said ratchet-bar to its forward limit of movement, an arm clamped to the rock-shaft of the said dropping mechanism of the planter, and a bar connecting this arm with the said ratchet-bar, substantially as and for the purposes stated.

604,180. CULTIVATOR. NILS O. STARKE, Madison, Wis., assignor to the Fuller & Johnson Manufacturing Company, same place. Filed Dec. 31, 1897. Serial No. 664,941. (No model.)

Claim.—1. In a cultivator or plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle; and a lever pivoted to the frame and connected to one end of said arm, substantially as described

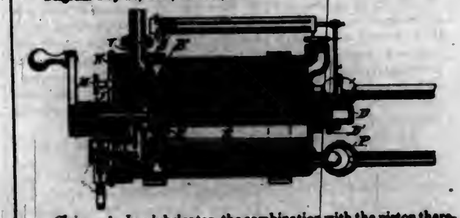
2. In a cultivator or plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle; a lever pivoted to the frame and connected to one end of said arm; a plow-beam pivoted to the frame; means for suspending said beam; and connections between said means and the opposite end of said arm for determining the position of the beams as the lever is raised or lowered.



3. In a cultivator or plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle extending forwardly and rearwardly thereof; a bell-crank lever pivoted to the frame and pivotally connected to one end of said arm; a plow-beam pivoted to the frame and extending beneath the axle; means for suspending the rear end of the beam pivotally supported upon the frame; and connections between said means and the forward end of the arm.

4. In a cultivator-plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle extending forwardly and rearwardly thereof and provided with an elongated slot or eye at its rear end; a lever J pivoted to the frame having its short arm in operative connection with said eye; a beam pivoted to the frame; and connections between said beam and the forward end of the arm.

5. In a cultivator or plow, the combination of a frame; an arched axle journaled thereon; an arm H secured to said axle and provided with an elongated eye I at its rear end; a lever J pivoted to the frame and provided at its short end with a stud or roller working in said eye; a plow-beam pivoted to the frame and extending rearwardly beneath said axle; a member N pivoted on the frame; lever M extending upwardly therefrom; rod L connecting said arm and the beam; link Q connected to said member N and provided with an elongated eye at its lower end; a connection between said eye and the forward end of arm A; and means for adjusting the member N.



6. In a cultivator-plow, the combination of a suitable frame; an arched axle journaled thereon; a slotted arm secured to said axle; and a lever pivoted to the frame and connected to one end of said arm, substantially as described.

604,181. WATER-HEATER. JAMES A. STEVENSON, New Castle, Pa. Filed Dec. 6, 1897. Serial No. 661,173. (No model.)

Claim.—In a water-heater, the combination with a hollow body forming a water-chamber and having water inlet and outlet passages, said body having a vertical opening around which the chamber extends, of a gas-burner supported below the hollow body with its discharge-openings outside the plane of said opening, and a removable cover to close the opening, whereby the flame from the burner may be confined below the upper surface of the hollow body, or permitted to pass up through the opening, substantially as and for the purpose specified.

604,182. LUBRICATOR. WILLIAM H. THOMPSON and ROBERT THOMPSON, London, England. Filed May 5, 1896. Serial No. 590,717. (No model.) Patented in England Feb. 2, 1892, No. 2,044; in Germany May 26, 1892, No. 70,631; in France May 26, 1894, No. 236,743, and in Belgium May 26, 1894, No. 110,179.

Claim.—1. In a lubricator, the combination with the piston thereof, of a revolving screw-threaded shaft, means for transmitting the motion of said shaft to the piston to operate it, a suitable device attached to said shaft for manually operating it, automatic actuating mechanism, and means for transmitting the motion of the automatic mechanism to said shaft and for permitting said shaft to be manually rotated without disconnecting it from said automatic mechanism.

2. In a lubricator, the combination of a piston, a screw and nut device, a handle attached thereto for manually operating it, an independently-moving pinion, means for automatically actuating said pinion and a pawl and ratchet device connecting said pinion and said screw and nut device.

3. In a lubricator, the combination with the piston thereof, of suitable means for actuating it, a train of speed-reducing gearing, the elements of which intermesh, interposed between the actuating mechanism and the piston, a pinion, an index attached to said pinion and a wheel-carriage carrying the elements of said train and provided with a rack meshing with said pinion whereby the actuating mechanism is applied to different elements of the train to translate a constant speed of the actuating mechanism into different speeds of the piston.

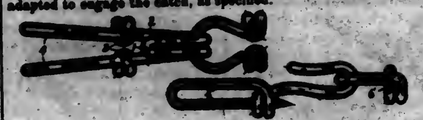
604,188. SUPPORT-BRACKET FOR LAMPS, GAS-BURNERS, OR THE LIKE. CHARLES M. TOLAND, Wilmington, Del. Filed Sept. 15, 1897. Serial No. 651,708. (No model.)

Claim.—1. In combination, a supporting-plate having a portion of its center cut away, cross-ribs lying in a lower plane than the plate, a handle carried by the plate by means of which it may be manipulated, a supporting-bracket adapted to be attached in two positions to the under side of the plate, and means for securing said bracket upon either a lamp-chimney or gas-burner, as shown and described.

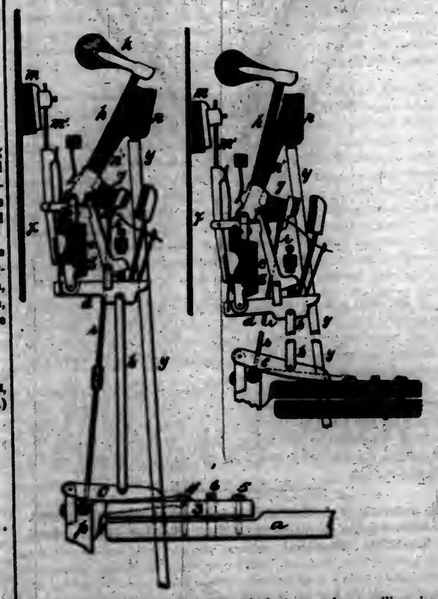
2. The herein-described combination of a supporting-plate having a portion of its center cut therefrom, cross-ribs lying in a lower horizontal plane, fingers projecting toward the center of the plate, a handle formed with the plate for its manipulation, clips secured to the under side of the plate, a supporting-bracket consisting of a single piece of wire so bent as to be attached to the under side of the plate in two positions and to either a lamp-chimney or gas-burner, and catch-hooks attached to the supporting-bracket whereby the latter may be clamped in position, as specified.

3. As a new article of manufacture, a supporting-plate having its center cut away, ribs extending across said cut-away portion and lying in a lower plane than the plate, fingers projecting into said cut-away portion and lying in the same plane as said plate, and means for supporting said plate above a lamp-chimney or gas fixture, as and for the purpose described.

4. A bracket for a heating attachment consisting of a single piece of wire doubled on itself and bent to produce a Y-shaped figure, the body of said bracket being bent to form a U-shaped portion, the ends of the arms being bent parallel with said U-shaped portion, and a plate adapted to be engaged by the U-shaped portion or by the ends of the arms, substantially as shown and described.



604,184. GARMENT-SUPPORTER. WILLIAM G. WARBURTON, Thomaston, Me. Filed Dec. 23, 1896. Serial No. 616,762. (No model.)



Claim.—A garment-supporter consisting of two slides placed one against the other, each of said slides having a central longitudinal bar connected by a coiled spring which surrounds both bars and reacts against the longitudinal movement of said slide, one of said slides having lower connections for the lower strap and the other or rear slide having transverse slots and bars at both ends adapted to receive the upper strap and means at the upper end for holding the said upper strap whereby the said strap is held at both ends of the slide and behind the spring, all as set forth.

604,185. HOOK AND EYE. PAULINE YOUNG, (now by marriage Pauline Young Weeks,) Philadelphia, Pa. Filed Dec. 1, 1896. Serial No. 614,003. (No model.)

Claim.—As a new article of manufacture, a garment-fastener of the hook-and-eye type, composed of a single piece of wire, having two catches each formed from the body of the wire and beneath the fastener by turning an end section of the wire outward from the fastener, then downward therefrom and inward and finally reversing the end section to complete the catch so that the strands forming each catch interlock, whereby spreading is prevented, and two plain pin-pointed loops each formed by turning the end section of wire from the catch across the initial strand thereof, the looper-point being adapted to engage the catch, as specified.

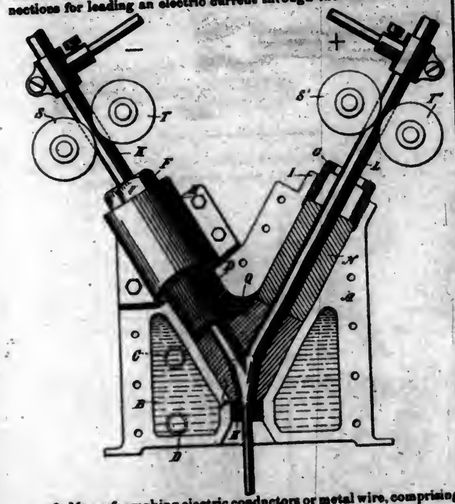
604,186. PIANOFORTE-ACTION. LUTHER A. BARBER, Buffalo, N. Y. Filed Jan. 26, 1897. Serial No. 620,702. (No model.)

Claim.—1. The combination with the key, and an auxiliary jack-lever arranged above the same, of a block or key-lever jack arranged between the key and said auxiliary jack-lever, a supporting-screw having a collar or shoulder supporting said block centrally and adjusting-screws arranged on opposite sides of the central supporting-screw to clamp said block upon said shoulder.

2. The combination with the key, and an auxiliary jack-lever arranged above the same, of a key-lever jack mounted between the key and said auxiliary jack-lever, a shouldered and adjustable support for said key-lever jack, and screws on each side of said support to secure said jack upon the shoulder of said support after it has been adjusted.

3. The combination with a buffer-rail, of a key, a pedal-rail, an auxiliary lever actuated by said key, a jack-lever, a sticker connecting it to said auxiliary lever, a jack, and a hammer.

4. The combination with the key, a pedal-rail, in substantially the same plane, an auxiliary jack-lever actuated by said key, a jack-lever, a sticker connecting it to said auxiliary, a jack, and a hammer, of a buffer-rail, and a rod connecting it to said pedal rail.



5. The combination with the key, a pedal-rail in substantially the same plane, an auxiliary jack-lever actuated by said key, a jack-lever, a sticker connecting it to said auxiliary, a jack, and a hammer, of a buffer-rail.

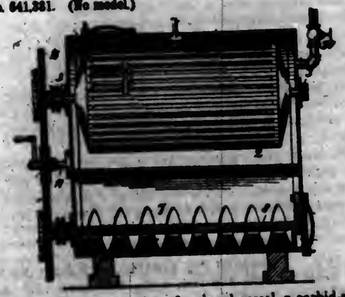
6. The combination with the key, a key-lever jack mounted thereon, a pedal-rail, an auxiliary jack-lever actuated by said key-lever jack, a jack-lever, a sticker connecting it to said auxiliary, a jack, and a hammer, of a buffer-rail, and a rod connecting it to said pedal-rail.

604,187. APPARATUS FOR ELECTRICALLY WORKING METALS. JAMES B. BENDY, New York, N. Y. Filed May 6, 1897. Serial No. 633,573. (No model.)

Claim.—1. Means for making electric conductors or metal wire, consisting of a refractory chamber containing a die, means for feed-

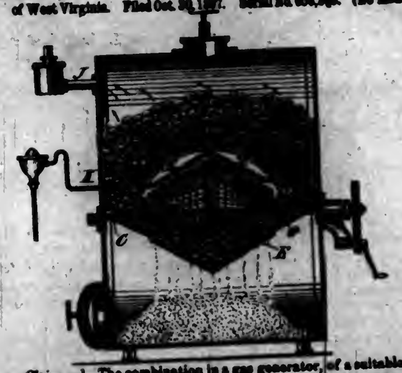
ing bars of metal therein and forcing them into contact with one another at or near the die, by pressure applied behind the die, and connections for leading an electric current through the bars.

2. Means for making electric conductors or metal wire, comprising a heat-refractory chamber containing a die, a plurality of openings into said chamber for bars of the metal to be worked, feed devices for forcing the bars into the chamber, and connections for leading an electric current through the bars.



3. Means for making electric conductors or metal wire, comprising a metal chamber having a heat-refractory lining said chamber containing a die and water-jacket around the same, openings for feeding in bars of the metal to be worked, feeding devices, for forcing the bars toward the die, and connections for leading an electric current through the bars.

604,138. FRAMELESS SPECTACLES OR EYEGLASSES. STEPHEN J. CLELES, Attleborough, Mass. Filed Sept. 15, 1897. Serial No. 651,742. (No model.)

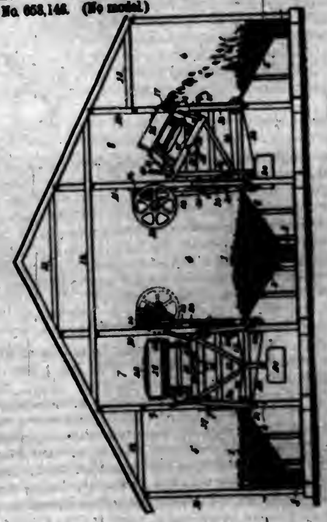


Claim.—As a new article of manufacture, a clip for frameless spectacles and eyeglasses consisting of a body portion, an arm or ear portion extending from the front end of the body portion, and an arm or ear portion connected with the rear end of the body portion by an elongated pliable non-resilient bent portion, the said arms or ear portions bearing against the opposite faces of the lens and being provided with perforations to receive the fastening-screw.

604,139. ACETYLENE-GAS-GENERATING APPARATUS. EDWARD H. DICKINSON, New York, N. Y. Filed June 18, 1897. Serial No. 641,331. (No model.)

Claim.—The combination of a closed vessel, a carbid-receptacle rotatably mounted therein, a discharge-screw or conveyer located beneath the carbid-receptacle, the said carbid-receptacle and discharge-screw being each provided with geared wheels having ratchets engaging in opposite directions, and a single intermediate gear and gaging in opposite directions, and a single intermediate gear and gaging in opposite directions, thereby enabling either the carbid-receptacle or the screw to be rotated at will, while the other remains at rest, substantially as described.

604,140. ACETYLENE-GAS GENERATOR. EDWARD J. DOLAN, Philadelphia, Pa., assignor to the Acetylene House Lighting Company, of West Virginia. Filed Oct. 30, 1897. Serial No. 656,993. (No model.)



Claim.—1. The combination in a gas-generator, of a suitable casing, a revoluble cage located in said casing and provided with open ends, a guide for each end of said cage and a carved protecting-casing over said cage, substantially as described.

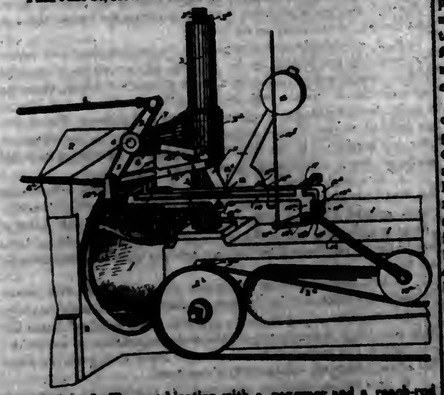
2. The combination in a gas-generator, of a suitable casing, a revoluble cage located in said casing, a protective casing over said cage, and means at the end of said cage for guiding a gas-producing material into it, said means in connection with said protective casing forming a chamber for the gas-producing material, a spraying device intermediate the cage and protective casing and a gas-outlet at the upper end of said casing, substantially as shown and described.

3. The combination in a gas-generator, of a suitable casing provided with a charging-opening at its upper portion and a manhole at its lower portion, a cage provided with open ends journaled in said casing, means in connection with said cage for revolving it, a protective casing over said cage, a guide for each of said open ends, said guides and casing forming a division for said casing, a spraying device intermediate the protective casing and cage, and a gas-outlet at the upper end of the casing, substantially as shown and described.

604,141. APPARATUS FOR HANDLING COMMINUTED MATERIALS. EDWARD F. DYER, Cleveland, Ohio. Filed Nov. 11, 1897. Serial No. 658,148. (No model.)

Claim.—1. In handling and storing apparatus, a building or shed, vertically divided into bays or compartments, a row or rows of pivoted platforms extending therethrough, means to tilt the platforms and hold the same in all positions, and counterweights suspended from a framework rigidly connected with the platform beneath it, at a point some distance below the pivot of the said platform, whereby the load is partially or wholly counterbalanced in all positions, substantially as specified.

2. A row of elevated pivoted platforms, means for tilting the same in either direction and holding them at any angle of inclination, a framework rigidly connected with each platform on the under side thereof, and a counterweight attached to said framework at such point beneath the pivot of the platform that the centers of gravity of the load and counterweight shall be approximately equidistant from the said pivot, whereby the load is partially or wholly counterbalanced in all positions, substantially as specified.



3. A row of elevated pivoted platforms, winding-gear for tilting the same in either direction, means for holding them at any angle of inclination, adjustable shores for sustaining each platform with its load in a level position, a framework rigidly connected with each platform on the under side thereof, and a counterweight attached to said framework at each point beneath the platform that the centers of gravity of the load and counterweight shall be approximately in equilibrium, whereby the load is partially or wholly counterbalanced in all positions, substantially as specified.

4. A row of elevated pivoted platforms, rails on the same for carriages to move thereon, means for tilting said platforms in either direction and holding them at any angle of inclination, a framework rigidly connected with each platform, on the under side thereof, and a counterweight attached to said framework at each point beneath the said platform that the centers of gravity of the load and counterweight shall be approximately in equilibrium, whereby the load is partially or wholly counterbalanced in all positions, substantially as specified.

5. In handling and storing apparatus, a building or shed provided with elevated ways on which cars or wagons are moved, in these ways tilting platforms provided with counterweights, ropes or chains to move or tilt the platforms right or left, the ropes or chains wound oppositely on drums moved by worm or tangent gearing that will lock and hold the gearing and platforms in any position, substantially as described.

6. In handling and storing apparatus, a building or shed provided with bins for storing, and elevated passages for cars or wagons, said passages having tilting platforms adapted to deposit loads from the cars or wagons, counterweights to compensate loads on the platforms when in an angular position, ropes or chains to move the platforms, attached to a rigid frame at an approximately equal distance, with the load, from the pivot on which the platforms turn, passing around pulleys to the right and left and wound on a drum moved by tangent gearing, all operating in the manner substantially as specified.

604,142. AUTOMATIC ENGINE-STOP. JOHN H. EASTWOOD, CHARLES H. BIRD, and FRANK MCELHINNEY, Colorado Springs, Colo. Filed June 26, 1897. Serial No. 642,302. (No model.)

Claim.—1. The combination with a governor and a reach-rod lever for controlling and regulating the detachment of steam-valves, of a pin for rigidly securing the reach-rod lever to rocking shaft, a link connected thereto and having its other end secured to a weight or spring actuated lever, a latch or catch for retaining said lever in operative position, means for releasing said latch or catch and means for throwing the reach-rod lever to such position as will prevent the opening of the steam-valves.

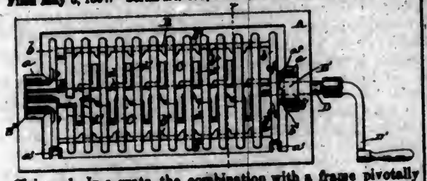
2. The combination with a governor and a reach-rod lever for controlling and regulating the detachment of steam-valves, of a tapering pin for rigidly securing the reach-rod lever to the governor rocking shaft, a spring for retaining said pin normally in its seat, a link pivotally connected to said pin and having a slotted connection at its other end to a weight or spring-actuated lever, a latch or catch for retaining said lever in operative position, means for releasing said latch or catch, and means for throwing the reach-rod lever to such position as will prevent the opening of the steam-valves.

3. The combination with means for disconnecting the reach-rod lever of an engine-valve gear from the governor, of a link having at one end a slotted connection with the reach-rod lever and the other end secured to a weight or spring actuated lever, a latch or catch for retaining said lever in operative position, and means for releasing said latch or catch to allow the lever to operate to throw the reach-rod lever to such position as will prevent the opening of the steam-valves.

4. The combination with a governor and a reach-rod lever for controlling and regulating the detachment of steam-valves, of a pin for rigidly securing the reach-rod lever to the governor rocking shaft, means for withdrawing said pin to disconnect the reach-rod lever from the governor, means for throwing the reach-rod lever to such position as will prevent the opening of the steam-valves; a latch-plate for retaining the parts normally in operative position, and means operated by the breaking or running off its pulley of the governor-belt for moving said latch-plate so as to release the operative parts.

5. The combination with means for disconnecting the reach-rod lever of an engine valve-gear from the governor and means for throwing the reach-rod lever to such position as will prevent opening of the steam-valves, of a latch or catch for retaining the parts normally in operative position and capable of being moved longitudinally to release the operative elements, a lever adapted to engage and move said latch or catch longitudinally and a wire or cord connected to said lever and extending to a distant point.

6. The combination with means for disconnecting the reach-rod lever of an engine valve-gear from the governor and means for throwing the reach-rod lever to such position as will prevent the opening of the steam-valves, of a latch or catch for retaining the parts normally in operative position and capable of being moved longitudinally to release the operative elements, speed-limit stops adjustably secured to said latch or catch across the path traversed by the end of the reach-rod lever and adapted to be engaged thereby.



7. The combination with means for disconnecting the reach-rod lever of an engine valve-gear from the governor and means for throwing the reach-rod lever to such position as will prevent the steam-valves being opened, of a compound latch or catch for retaining the parts normally in operative position having as a whole a longitudinal movement operated mechanically and an independent lateral movement and means for operating the lateral movement electrically.

8. The combination with means for disconnecting the reach-rod lever of an engine valve-gear from the governor and means for throwing the reach-rod lever to such position as will prevent the opening of the steam-valves, of a compound latch or catch for retaining the parts normally in operative position having as a whole a longitudinal movement operated mechanically, an independent arm adapted to move laterally to which the projecting catch is secured, a spring for holding said arm normally in a locking position, and an electromagnet adapted to attract said independent arm with its projecting catch whenever the electric circuit is closed substantially as specified.

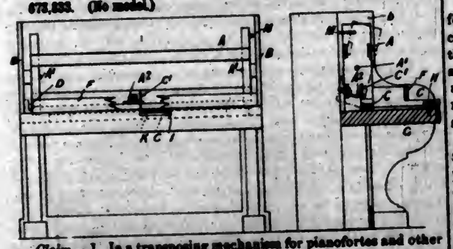
9. The combination in an automatic engine-stop of a pin for securing the reach-rod lever of the engine valve-gear rigidly to the governor, a spring for holding said pin normally in its seat, a link connected pivotally to said pin and having its other end secured by a slotted pivotal connection to a weight or spring-actuated lever, a link having a slotted pivotal connection to the lower arm of the reach-rod lever and having its other end secured to said weight or spring actuated lever, a compound latch or catch for normally retaining the weight or spring actuated lever in operative position which is adapted to be moved longitudinally as a whole to release said lever, adjustable speed-limit blocks secured to said longitudinally-movable latch and adapted to be engaged by the reach-rod lever as it is moved to and fro by the governor as the speed of the engine varies, a pivoted lever having one arm adapted to engage and move the latch-plate longitudinally and a wire or cord secured to the other arm and extending to a distant point, an arm loosely connected to said pivoted lever and having a pulley on its outer end adapted to rest normally on the governor-belt, and a pin connection between the hub of said arm and the pivoted lever, adapted to be engaged and cause the latch-plate to be moved, upon the dropping of the arm and pulley, a laterally-movable arm, carrying a projecting stop, pivoted to the longitudinally-movable part of the latch-plate and held in its normal position by means of a spring, and an electromagnet for attracting

and withdrawing said laterally-movable arm upon the closing of an electric circuit, substantially as specified.

604,148. GRATE. CORNELIUS FULLER, Warren, R. I., assignor of one-half to the Somerset Stove Foundry Company, Somerset, Mass. Filed May 6, 1897. Serial No. 635,317. (No model.)

Claim.—1. In a grate, the combination with a frame pivotally mounted, of a plurality of grate-bars loosely hinged alternately to opposite sides of the frame, a shaft capable of continuous rotation having cams arranged alternately on opposite sides and adapted to lift and drop the grate-bars, and fingers on said shaft adapted to revolve in the spaces between the grate-bars, substantially as described.

2. In a grate, the combination with a frame having tubular trunnions, of a cam-shaft capable of continuous rotation journaled in said trunnions and provided with fingers, and a plurality of grate-bars loosely hinged at one end to said frame and lying transverse to said shaft, with spaces between them for the fingers, substantially as described.



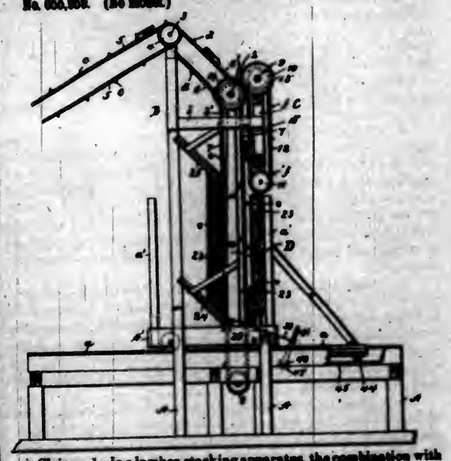
3. In a grate, the combination with a frame having tubular trunnions and carrying grate-bars, of a cam-shaft journaled in said trunnions and smaller in diameter than the interior of one of them, teeth on said large trunnion, and similar teeth on the shaft, whereby when said teeth are interlocked, the turning of the shaft will turn the frame on its trunnions, substantially as described.

4. In a grate, the combination with a frame having notched side bars, of grate-bars having at one end a hook and a guard-lug to engage with said notches, and at the other end only a shoulder to rest upon the side bar with no portion projecting under said bar, and means for lifting the grate-bars, substantially as described.

5. In a grate, the combination with a frame pivotally mounted on tubular trunnions, of a plurality of grate-bars supported on said frame, a cam-shaft loosely journaled in said trunnions and serving to actuate said bars, and teeth on said shaft and on one of said trunnions, whereby the shaft can be used to turn the frame when said teeth are interlocked, substantially as described.

6. The combination with the main frame A having depending bearings a, of a frame B having tubular trunnions B^2 B^3 resting in said bearings, said frame B being composed of end bars b, side bars b^2 having notches and provided with ribs b^4, open grate-bars C having hooks c, lugs c', shoulders c^2 and notches c^3, a cam-shaft D having cams d, fingers d' and teeth d^2, and teeth b^5 on one of the trunnions of the frame B, substantially as described.

604,144. TRANSPOSING MECHANISM FOR PIANOFORTES. EDMUND H. STERRY, London, England. Filed Mar. 14, 1896. Serial No. 583,233. (No model.)



Claim.—1. In a transposing mechanism for pianofortes and other keyboard instruments the action-frame mounted on horizontal pivots in combination with means for swinging it thereon so that its lower part can be swung back to clear the keys and the upper part be swung forward to clear the strings, whereupon the key-frame can be shifted laterally to the desired extent and the action-frame then be returned to its normal position substantially as set forth.

2. In a transposing mechanism the action-frame mounted in horizontal pivots in combination with means for swinging it thereon, keys with chamfered-off back ends to clear the prolongs on the action-frame, a key-frame capable of limited lateral movement on the key-bottom and means for holding it in the position according to the desired key substantially as set forth.

3. In a transposing mechanism the combination of the action-frame mounted in horizontal pivots, a rod attached to the lower end of the action-frame for swinging it back and forth, a comb-shaped plate on the action-frame, a key-frame capable of limited movement on the key-bottom, and a finger on the key-frame engaging with said comb for holding the key-frame in position according to the desired key substantially as set forth.

4. In a transposing mechanism the combination of the action-frame mounted on horizontal pivots, means for swinging it thereon, a frame provided with slotted plates, pins on the key-bottom working in the slots, a knob on the key-frame for moving it, and a plate fixed at the front of the instrument with slot for limiting the movement of the knob therein substantially as set forth.

604,145. LUMBER-STACKING APPARATUS. WILLIS GRAHAM, Meridian, Miss. Filed Oct. 2, 1895. Renewed Oct. 21, 1897. Serial No. 655,958. (No model.)

Claim.—1. In a lumber-stacking apparatus, the combination with means for receiving the lumber to be stacked, of two series of parallel conveyer-chains constructed and adapted to form a throat for the reception of lumber between them, and lugs on said chains to receive and lower said lumber, substantially as set forth.

2. In a lumber-stacking apparatus, the combination with means for receiving lumber to be stacked, of two parallel conveyer-chains, having lugs for the reception of the lumber, said chain being so disposed as to form a throat into which the lumber is made to pass, and gearing constructed and adapted to cause both chains to move at the same rate of speed, whereby to cause lugs of one chain to cooperate with the lugs of the other chain for lowering the lumber through said throat, substantially as set forth.

3. In a lumber-stacking apparatus, the combination with means for receiving the lumber to be stacked, of two series of parallel chains constructed and adapted to form a throat between them for the reception of lumber, lugs projecting from both series of chains, a main elevating-carrier terminating above said series of chains, and an inclined carrier adapted to receive lumber from the elevating carrier and deposit it in the throat formed by the two first-mentioned series of chains, substantially as set forth.

4. In a lumber-stacking apparatus, the combination with means for receiving the lumber to be stacked, of two series of chains disposed parallel with each other and having lugs thereon, one series of chains terminating above the other, and means for depositing lumber in the throat formed by the two series of chains, substantially as set forth.

5. In a lumber-stacking apparatus, the combination with means for receiving lumber to be stacked, of a series of chains having lugs for the reception of lumber to be stacked, and a yielding device behind each chain, whereby to hold the chains normally in proper working position and permit them to yield and allow the lugs to pass lumber already stacked, substantially as set forth.

6. In a lumber-stacking apparatus, the combination with means for receiving lumber to be stacked, of a series of chains having lugs for the reception of the lumber to be stacked, a bar adapted to bear against each chain, and yielding devices in rear of said bar, substantially as and for the purpose set forth.

7. In a lumber-stacking apparatus, the combination with a framework adapted to receive trucks, of a series of lowering-chains disposed over the position occupied by the trucks and yielding pusher-bars adapted to receive said chains, substantially as set forth.

8. In a lumber-stacking apparatus, the combination with means for receiving the lumber to be stacked, of a series of chains carrying lugs for the reception of the lumber to be stacked and adapted to place the lumber in position, a pivoted bar behind each chain, and a series of springs behind each pivoted bar, substantially as set forth.

9. In a lumber-stacking apparatus, the combination with suitable framework and a truck, of a series of chains having lugs thereon adapted to receive lumber and stack it on the truck, and a short series of chains having lugs, said short series of chains being disposed parallel with the first-mentioned chains so as to form a throat or passage for the lumber, the short series of chains terminating at their lower ends a distance above the truck about equal to the desired height of the stack of lumber thereon, substantially as set forth.

10. In a lumber-stacking machine, the combination with suitable framework and a truck, of two series of parallel conveyer-chains adapted to form a throat between them for the reception of lumber to be stacked, and means for moving the truck step by step as the tiers of lumber on the truck shall have been successively completed, substantially as set forth.

11. In a lumber-stacking machine, the combination with a truck and means for piling lumber thereon in tiers, of a movable bar, a standard carried by said bar and adapted to be connected with the truck, and means for moving said movable bar to move the truck, substantially as set forth.

12. In a lumber-stacking apparatus, the combination with a framework, a truck adapted to run thereon and means for piling lumber on said truck, in tiers, of a sliding bar, a standard carried by the sliding bar and adapted to be connected with the truck, a rack-bar on the sliding bar, a pinion meshing with the rack-bar, and a ratchet device for moving said pinion step substantially as set forth.

13. In a lumber-stacking apparatus, the combination with a framework, a truck adapted to run thereon, and means for stacking lumber on the truck, of a sliding bar, and a collapsible standard carried by said sliding bar and adapted to be connected with the truck, said standard being adapted to bear against the lumber on the truck, substantially as set forth.

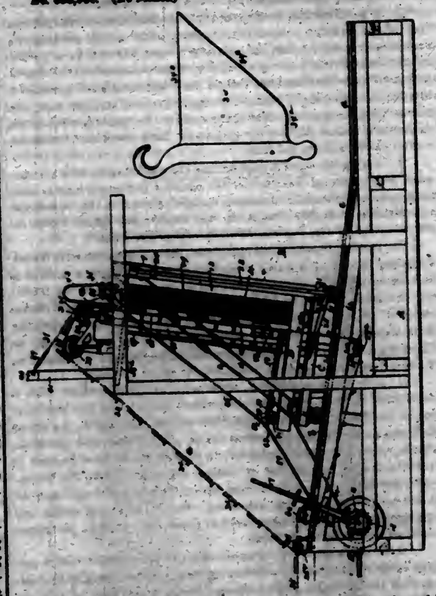
14. In a lumber-stacking apparatus, the combination with a framework, a truck adapted to run thereon and means for stacking lumber on the truck, of a sliding bar, a standard hinged to the sliding bar and adapted to bear against the lumber on the truck, a connection between said standard and the truck, and a collapsible brace connecting the upper end of the standard with the sliding bar, substantially as set forth

15. In a lumber-stacking apparatus, the combination with a framework and a series of trucks adapted to run thereon, of a sliding bar in proximity to each truck, a standard hinged to each sliding bar and adapted to bear against the lumber on the trucks, a connection between the standards and the trucks, a collapsible bracket connecting the upper ends of the standards with the sliding bars, a rack-bar on each sliding bar, a shaft, pinions carried by the shaft and meshing with the rack-bars, and a ratchet device connected with said shaft whereby to move the pinions step by step, substantially as set forth.

16. In a lumber-stacking machine, the combination with a truck and means for piling lumber thereon, of a fixed stick-holder, substantially as set forth.

17. In a lumber-stacking machine, the combination with a truck and means for piling lumber thereon, of a stick-holder having its bottom inclining toward the lumber on the truck, substantially as set forth.

18. In a lumber-stacking machine, the combination with means for receiving lumber and means for stacking said lumber, of a stick-holder, a notched wheel or cam at the bottom, and means for operating said notched wheel or cam whereby to cause it to eject a stick, substantially as set forth.



19. In a lumber-stacking apparatus, the combination with a truck and means for piling lumber thereon, of a stick-holder having an inclined bottom, and a spring-actuated device at the top of the holder adapted to bear on the forward stick, substantially as set forth.

20. In a lumber-stacking apparatus, the combination with a truck and means for piling lumber thereon, of a stick-holder having an inclined bottom, a cam or notched wheel at the bottom of the stick-holder to receive the forward stick, a spring-actuated device at the top of the holder to bear against said forward stick, and means for operating the cam or notched wheel whereby to eject the stick, substantially as set forth.

21. In a lumber-stacking apparatus, the combination with a truck and means for piling lumber thereon, of means for placing sticks between the tiers of lumber, and hooks or bars for holding said sticks in place while a tier of lumber is being piled against them, and means for operating said hooks or bars, substantially as set forth.

22. In a lumber-stacking machine, the combination with a truck and means for piling lumber thereon, of a stick-holder having an inclined bottom, a cam or notched wheel at the lower end of the holder and adapted to receive the forward stick in the holder, a hood or bar for holding the stick in place against the lumber after it shall have been released from the stick-holder, a bell-crank lever connected with the journal of said cam or wheel, a connection between said bell-crank lever and the said hood or bar, an operating-lever, and a connection between the operating-lever and the bell-crank lever, substantially as set forth.

604,146. LUMBER-STACKING APPARATUS. WILLIS GRAHAM, Meridian, Miss. Filed Nov. 19, 1895. Renewed Oct. 21, 1897. Serial No. 656,959. (No model.)

Claim.—1. In a lumber-stacking apparatus, the combination with a carriage, of trucks adapted to run onto said carriage, and gates connected with the carriage for preventing the escape of said trucks while lumber is being piled on the latter, substantially as set forth.

2. In a lumber-stacking apparatus, the combination with a carriage comprising a transverse timber and a series of parallel bars or arms projecting at right angles from said transverse timber, of braces securing said timber and bars or arms together, trucks adapted to run onto said carriage, lugs on the braces and gates hinged to some of said lugs and adapted to be removably connected with lugs on other braces, whereby to normally prevent the escape of the trucks from the carriage, substantially as set forth.

3. In a lumber-stacking apparatus, the combination with a framework and inclined tracks, of a carriage on said inclined tracks, means for normally holding said carriage in position, trucks on said carriage for receiving lumber to be piled, standards on said trucks, and devices carried by the carriage for engaging said trucks, and devices for engaging the tops of the standards whereby to retain said trucks normally in position while they are being loaded with lumber, substantially as set forth.

4. In a lumber-stacking apparatus, the combination with a carriage adapted to receive trucks having standards, of uprights projecting from said carriage, guides carried by said uprights, a transverse timber on said standards and in said guides and adapted to be normally engaged by the standards on the trucks, and means for raising said transverse timber out of line with said standards, substantially as set forth.

5. In a lumber-stacking apparatus, the combination with a carriage adapted to receive trucks having standards, of uprights projecting from said carriage, guides at the upper ends of said uprights, a transverse timber supported by the uprights in said guides, said transverse timber being normally disposed in the path of the standards on the trucks, a shaft supported by the carriage, arms projecting from said shaft, rods connected to said arms and terminating

under said transverse timber, and a lever for operating said shaft whereby to raise the rods and lift the transverse timber out of line with the standards on the trucks, substantially as set forth.

6. In a lumber-stacking apparatus, the combination with framework and means for holding trucks in position while being loaded, of a series of endless chains arranged to receive a board, elevate it, and lower it, positively placing it upon the trucks, a portion of said chains being always disposed at right angles to the trucks and parallel with the standards of said trucks, substantially as set forth.

7. In a lumber-stacking apparatus, the combination with a framework and trucks having standards, of a series of endless chains having lugs thereon and means for conveying lumber to said endless chains, said endless chain being so disposed as to receive a board, elevate it, and lower it, positively placing it upon the trucks, one board edgewise upon another, substantially as set forth.

8. In a lumber-stacking apparatus, the combination with a framework and trucks, of endless chains arranged to receive a board, elevate it, and lower it, positively placing it upon the trucks, a portion of said chains being disposed parallel with the standards of the trucks, spring-actuated presser-bars behind said last-mentioned portions of the chains, and upright beams for supporting said presser-bars, said beams being secured at their upper ends to the upper portion of the framework and at their lower ends to the base portion of the framework, substantially as set forth.

9. In a lumber-stacking apparatus, the combination with a framework and trucks, of flexible devices adapted to deposit lumber onto the trucks, and inverted-U-shaped springs secured to the framework and forming, in conjunction with said flexible devices, a throat for the reception of the lumber, substantially as set forth.

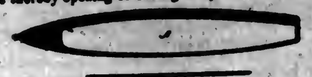
10. In a lumber-stacking apparatus, the combination with framework and trucks, of a series of endless conveyer-chains, a portion of each chain being at all times disposed at right angles to the trucks and extending above and below the same, and a portion of said chains being at all times so disposed as to convey the lumber above the truck-standards, and yielding devices constructed and adapted to direct the lumber from the last-mentioned portions of the chains to the first-mentioned portions, substantially as set forth.

11. In a lumber-stacking apparatus, the combination with a framework and trucks, of sprocket-wheels mounted in the base portion of the framework, upper sprocket-wheels mounted in the top of the framework, a series of endless chains passing over said sprocket-wheels, said chains being adapted to convey lumber and deposit it upon the trucks, a cross bar or timber supported above the framework, springs secured to said cross bar or timber, and chains secured at one end to said springs, extending over the conveyer-chains and upper sprocket-wheels, and secured at their other ends to the framework, substantially as set forth.

12. In a lumber-stacking apparatus, the combination with a carriage adapted to receive trucks having standards, of uprights projecting from the carriage, guides secured to the upper ends of said uprights, a transverse timber on said uprights and in said guides, brackets on the carriage, and truss-rods secured to said brackets and at their upper ends to the said guides, substantially as set forth.

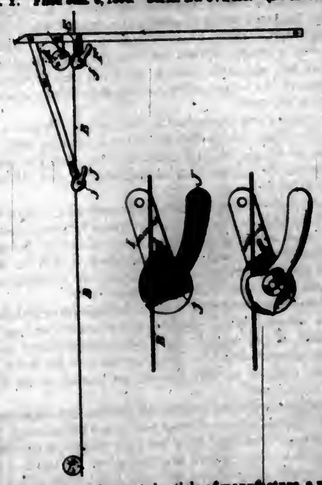
13. In a lumber-stacking apparatus, a stick-feeding device comprising an endless chain having pockets and means for moving said chain step by step, substantially as set forth.

14. In a lumber-stacking apparatus, a stick-feeding device comprising an endless chain having pockets for the reception of the sticks, a ratchet-wheel connected with one of the sprocket-wheels over which said chain passes, a pivoted arm, a dog connected with said arm and adapted to engage said ratchet-wheel and means for vibrating said arm whereby to move the endless chain step by step, substantially as set forth.



15. In a lumber-stacking apparatus, the combination with a framework and a carriage adapted to receive trucks, stick-feeding devices comprising endless chains having pockets, a lever for controlling the movement of the carriage, and step-by-step devices connected with said chains and said lever, substantially as set forth.

16. In a lumber-stacking apparatus, the combination with a framework and means for supporting trucks, of stick-feeding devices comprising endless chains having pockets, an operating-lever, hoods adapted to receive the upper ends of the sticks and hold them in position, step-by-step devices for the said feeding-chains connected with the operating-lever and means connecting said operating-lever with said hoods, substantially as and for the purpose set forth.



17. The combination with a truck adapted for the reception of lumber and having a standard at each end, of a binder consisting of a hook to engage one standard, a rope attached to said hook and adapted to pass over the lumber and the other standard, and a clamp attached to said rope and adapted to engage the last-mentioned standard, substantially as set forth.

604,147. STRINGER. JOHN GRAY, Pittsburg, Pa., assignor to W. P. Fitz Gerald. Filed May 4, 1894. Serial No. 510,061. (No model.)

Claim.—As an article of manufacture, a syringe comprising a hollow elastic and compressible bulb made in the form of a cigar and having a tapered end having an inward tubular extension and a socket or bore in said extension, the latter being provided with a side passage-way opening into the bulb-chamber, all integral, and a sliding tube open at each end and adapted to work back and forth in said bore thereby opening or closing the passage-way, as set forth.

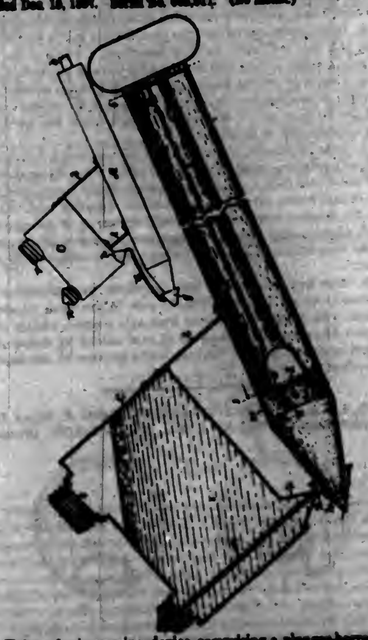
604,148. WIRE-STRETCHER. THEODORE H. GOSS, Marcellus, N. Y. Filed Jan. 6, 1896. Serial No. 574,488. (No model.)

Claim.—As an improved article of manufacture, a wire-stretcher, composed of a lever having a projecting fulcrum or stud thereon near one end, a wire-clamp arm pivotally attached to said lever at one side of said stud, a second wire-clamp arm pivotally attached to said lever by a link at the other side of said stud, said clamp-arms and stud projecting from the same side of the lever, the link by which said second clamp-arm is attached to the lever being longer than the first clamp-arm, substantially as described.

604,149. MEANS FOR SECURING PRINTING-PLATES TO CYLINDRICAL SURFACES. JOHN T. HAWKINS, Taunton, Mass., assignor to the Campbell Printing Press and Manufacturing Company, New York, N. Y. Filed Dec. 7, 1895. Serial No. 570,994. (No model.)

Claim.—1. In combination with a printing form or bed having a circumferentially-grooved cylindrical surface, thin tying or holding strips, as S, provided with means for securing the under sides of printing blocks or plates thereto, and adapted to be strained upon said cylindrical surface, substantially as and for the purposes set forth.

2. The combination of a cylindrical holding-surface, grooves formed therein, straining-strips fitting within said grooves, said cylindrical surface carrying straining means for said strips, said strips carrying a number of printing-plates, substantially as described.

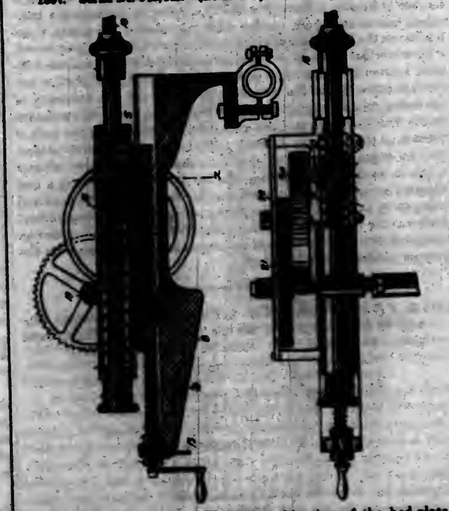


604,150. TOILET-PAPER CUTTER. JOHN HERMAN, Sr., Green Bay, Wis. Filed July 20, 1896. Renewed Nov. 2, 1897. Serial No. 657,302. (No model.)

Claim.—1. A cutter for toilet-paper machines, comprising a blade subdivided by recesses in its edge into a series of flat teeth and having in the sides of the teeth a series of V-shaped depressions formed to alternate with each other on opposite sides of the blade and causing the edge to appear in a zigzag line, in combination with means for causing said blade to reciprocate vertically and a die adapted to receive the blade as it penetrates the paper, substantially as described.

2. A cutter for toilet-paper machines, comprising a blade formed with teeth E and E', each tooth having trough-shaped recesses or depressions in the sides thereof arranged to form a cutting edge in a zigzag line in combination with a reciprocating head-block, for actuating the blade, and a die located beneath the path of the paper and adapted to receive the blade as it penetrates the paper, substantially as described.

604,151. SPRAYING DEVICE. GEORGE A. KENT, Everett, N. Y. Filed Dec. 15, 1897. Serial No. 661,811. (No model.)



Claim.—1. A spraying device comprising a plunger-barrel and contained plunger, the barrel having a delivery-opening, a cap for said delivery-opening having a delivery-opening in line with the opening of the barrel, said a reservoir for liquid so placed and arranged with reference to said barrel and cap as to deliver the liquid by gravity into the space between the cap and barrel, substantially as specified.

2. A spraying device comprising a plunger-barrel having a delivery-opening, a cap extending over the end of the barrel and having a delivery-opening in line with the delivery-opening in the barrel, a plunger within said barrel, a reservoir for liquid so placed and arranged with reference to said barrel and cap as to deliver the liquid by gravity into the space between the cap and barrel, and means for controlling the passing of liquid from the reservoir to the interior of the cap, substantially as specified.

3. A spraying device comprising a plunger-barrel having a conical apertured extremity and a plunger within the barrel, a conical cap carried by the end of the barrel and provided with a delivery-opening in line with the delivery-opening therein, a reservoir supported by the barrel and provided with a conical chamber at its bottom communicating with the cap and designed to discharge liquid into the cap and around the end of the barrel, and mechanism designed to control the passage of liquid from the conical chamber to the cap, substantially as specified.

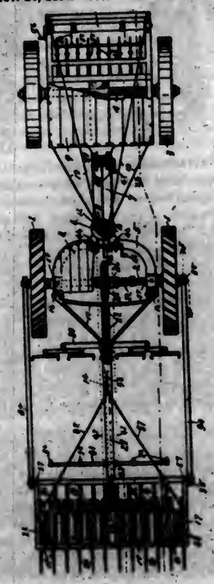
4. A spraying device comprising a plunger-barrel having an apertured conical extremity and a contained plunger, a conical cap fitting over the conical end of the barrel and provided with a discharge-opening in line with the aperture therein, a reservoir supported upon the exterior of the barrel and provided with a conical chamber at its bottom and communicating with the cap and designed to permit the gravitation of liquid from the reservoir to the space between the cap and the conical end of the barrel, a rod extending through the reservoir and designed to be reciprocated for the purpose of opening or closing the passage from the reservoir to the cap, and a screw-cap secured to said rod and designed by its rotation to actuate the same, substantially as and for the purpose specified.

604,152. ROCK-DRILL. MARIANO C. JAMIESON, Denver, Colo., assignor of one-half to Henry Darell Gripper, same place. Filed Aug. 16, 1897. Serial No. 648,448. (No model.)

Claim.—1. In a rock-drill, the combination of the bed-plate, the casing slidingly mounted thereon, a transverse shaft journaled on the casing, a gear-wheel fast on said shaft, another shaft journaled on the casing, a pinion fast on the last-named shaft and meshing with the said gear-wheel, a fly-wheel fast on the pinion-shaft and provided with a cam, the drill-shaft located in the casing, a power-spring engaging said shaft, a loose collar mounted on the drill-shaft and provided with a lug projecting into the path of the cam on the fly-wheel whereby as the last-named wheel is rotated the cam engages the said lug, draws the shaft backward and releases it, the forward movement being effected by the power-spring, a dog mounted on said lug, and a ratchet-collar fast on the drill-shaft and engaged by said dog, the casing being provided with a longitudinal guideway for the lug on the loose collar, the depth of said guideway being sufficient to allow the said projection to oscillate therein for the purpose of turning the drill-shaft.

2. In a rock-drill, the combination with the casing, the reciprocating shaft and the power-spring, of a loose collar mounted on the drill-shaft and provided with a lateral projection, a dog mounted on said projection, a ratchet-collar fast on the drill-shaft and engaged by said dog, the casing being provided with a longitudinal guideway for the projection on the loose collar, the depth of the said guideway being sufficient to allow the said projection to oscillate therein for the purpose of turning the drill-shaft, a rotary cam mounted on the drill-casing and engaging the projection on the loose collar which

projection lies in the path of the cam, and suitable means for rotating the cam.



3. In a rock-drill, the combination with the casing and the reciprocating shaft, of a collar loosely mounted on said shaft and reciprocating therewith, said collar being provided with a projection, the casing being grooved to form a guideway for this projection, which is allowed to oscillate therein to a limited extent for the purpose of turning the drill-shaft, a spring engaging said collar and normally holding it on the bottom of the said guideway, a dog carried by said projection, a ratchet-collar fast on the drill-shaft and engaged by said dog, and a rotary cam mounted on the casing and engaging the projection on the collar.

4. In a rock-drill, the combination with the casing and the reciprocating shaft, of a loose collar mounted on said shaft and reciprocating therewith, said collar being provided with a lateral projection, the casing having a guideway formed therein for said projection in which the latter is allowed a limited oscillatory movement for the purpose of rotating the drill-shaft, the bottom of the guideway being inclined, a spring engaging a projection on the loose collar whereby the said projection is normally held in the bottom of said guideway, and a rotary cam engaging the outer extremity of said projection which is provided with an antifriction-roller.

5. In a rock-drill, the combination of the guide bed or track, the casing slidingly mounted thereon and provided with a nut, a shoe detachably mounted on the rear extremity of the guide-bed, the feed-screw being journaled in said shoe, and a cam pivotally mounted on the guide-bed and adapted to lock the shoe thereon.

6. In a rock-drill, the combination of the bed-plate, the casing slidingly mounted thereon and provided with a threaded opening in its rear extremity, a transverse shaft journaled on the casing, a gear-wheel fast on said shaft, another shaft journaled on the casing, a pinion fast on the last-named shaft and meshing with the said gear-wheel, a fly-wheel fast on the pinion-shaft and provided with a cam, the drill-shaft located in the casing, a power spring engaging said shaft, a tension-nut screwed into the threaded opening in the rear extremity of the casing, said nut engaging said power-spring, a loose collar mounted on the drill shaft and provided with a lug projecting into the path of the cam on the fly-wheel, whereby as the last-named wheel is rotated, the cam engages the said lug, draws the shaft backward and releases it, the forward movement being effected by the power-spring, a dog mounted on said lug, and a ratchet-collar fast on the drill-shaft and engaged by said dog, the casing being provided with a longitudinal guideway for the lug on the loose collar, the depth of said guideway being sufficient to allow the said projection to oscillate therein for the purpose of turning the drill-shaft.

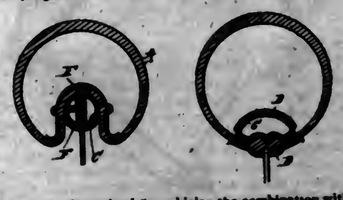
604,153. HORSE-POWER BAYONET. ADOLPH J. JOHNSON, Minneapolis, Minn., assignor of one-half to Edward H. O. Holien, same place. Filed Nov. 27, 1897. Serial No. 659,959. (No model.)

Claim.—1. An implement of war comprising a multiplicity of bayonets mounted for endwise movement and projecting in advance of the machine, and mechanism driven by horse-power for vibrating said bayonets, substantially as described.

2. In an implement of war, the combination with a truck with traction-wheels, of a pole projecting forward from said truck, a frame-work at the forward end of said pole, a series of bayonets mounted for endwise movement in said frame, a crank-shaft mounted in said frame and provided with connections to said bayonets, and a sprocket-and-chain drive between the axle of said traction-wheels and said crank-shaft, substantially as described.

3. In an implement of war the combination with a four-wheeled truck, certain of which wheels are traction-wheels, of a pole projecting forward from said truck, a frame at the forward end of said pole, bayonets mounted for endwise movement in said frame, a mast rising from said truck, a hoisting connection attached to said frame, or at the forward end of said pole, and running over a guide at the top of said mast, and a windlass on said truck connected to the rear end of said hoisting connection, whereby said bayonets may be supported in different operative vertical positions, substantially as described.

4. In an implement of war, the combination with a four-wheeled truck two of which wheels are traction-wheels, of a pole projecting forward from said truck, a frame, at the forward end of said pole, the bayonets mounted for endwise movement in said frame, the crank-shaft mounted in said frame and connected by pitmen to said bayonets, the sprocket-and-chain drive between the axle of said traction-wheels and said crank-shaft, the mast rising from said truck, the cable connected to said frame and running over a guide at the top of said mast, and a windlass on said truck connected to the rear end of said cable, substantially as described.



5. In an implement of war, the combination with a four-wheeled truck, of a pole projected forward from the same, a frame at the forward end of said pole, means for raising and lowering the forward end of said pole from the truck, a series of bayonets mounted for endwise movement in said frame, and a series of swords depending from said frame, said parts operating substantially as described.

6. In an implement of war, the combination with a four-wheeled truck, of a pole projecting forward therefrom, a frame at the end of said pole, a series of bayonets mounted for endwise movement in said frame, a series of swords depending from said frame, another series of swords depending from said truck, and means for raising and lowering the forward end of said pole from said truck, said parts operating substantially as described.

7. In an implement of war, the combination with a four-wheeled truck, of a pole projecting forward from said truck, a frame at the forward end of said pole, a series of bayonets mounted for endwise movement in said frame, driving connections for vibrating said bayonets from the traction-wheels of said truck, the series of spring-pressed swords 42 depending from said frame, and a common lifting connection for simultaneously raising all of said swords, substantially as described.

8. In an implement of the class described, the combination with the traction-wheels 1, their axle 2, the pole 14, the frame 17, and the bayonets with driving connections from said traction-wheels, of the side rods 34 connected to the ends of said axle 2 by means of the pronged or slotted keys 35 working in the grooves 36, substantially as described.

604,154. WHEEL FOR VEHICLES. ERNEST F. JULIAN, Teignmouth, England. Filed July 6, 1897. Serial No. 643,891. (No model.)

Claim.—1. In a wheel for vehicles, the combination with the rim of a wheel, of a split tire, a non-contractible ring adapted to receive the edges of the split tire and a tube seated between the said edges and the said rim, whereby by the inflation of said tube, the various parts are retained in the proper relative position, substantially as described.

2. In a wheel for vehicles, the combination with the rim of a wheel, of a split tire, a non-contractible ring adapted to receive the edges of the split tire and a tube seated between the said edges and the said rim, whereby, by the inflation of said tubes the various parts are retained in the proper relative position, said ring being provided with recesses in the inner surface thereof, substantially as described

604,155. WHEEL FOR VEHICLES. ERNEST F. JULIAN, Teignmouth, England. Filed July 6, 1897. Serial No. 643,892. (No model.)

Claim.—1. In a wheel for vehicles, the combination with the rim of a wheel, of a fully, upwardly-directed flanges thereon, and a tube seated between said flanges, said fully and said rim whereby said parts are bound together said rim being of smaller dimension than the diameter of said tube whereby by the inflation of said tube a depression is formed to receive said rim and the various parts are more securely retained in their positions, substantially as described.

2. In a wheel for vehicles, the combination with the rim of a wheel, of a fully, upwardly-directed flanges thereon, a tube seated between said upwardly-directed flanges, said fully and said rim, downwardly-directed flanges on said fully and an independent tread seated between said downwardly-directed flanges, said rim being of smaller dimension than the diameter of said tube whereby by the inflation of said tube a depression is formed to receive said rim and the various parts are more securely retained in their positions, substantially as described.

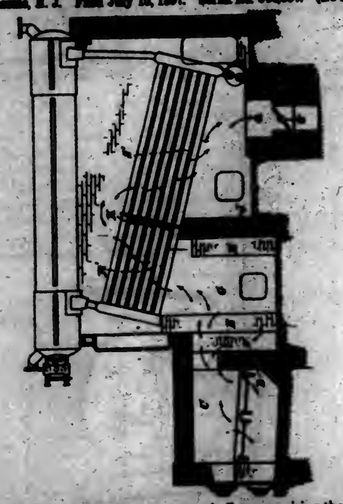
3. In a wheel for vehicles, the combination with the rim of a wheel, of a fully, upwardly-directed flanges thereon, a tube seated between said flanges said fully and said rim, downwardly-directed flanges on said fully, an independent tread seated between said last-mentioned flanges, a cover secured between the upper ends of said upwardly-directed flanges and means whereby said cover is firmly attached thereto, said rim being of smaller dimension than the distance between said first-mentioned flanges, whereby by the inflation of said tube, the various parts are more securely retained in their positions substantially as described.

4. In a wheel for vehicles, the combination with the rim of a wheel, of a fully, upwardly-directed flanges thereon, a tube seated between said flanges, said fully, and said rim, downwardly-directed flanges on said fully, an independent tread seated between said last-mentioned flanges, a cover secured between the upper ends of said flanges, said flanges being provided respectively with a projection whereby said cover is firmly attached thereto, said rim being of smaller dimension than the distance between said first-mentioned flanges, whereby by the inflation of said tube the various parts are more securely retained in their positions, substantially as described.

604,156. CHAIR. FRANK H. KASSEN, Rosiya, Wash. Filed May 17, 1897. Serial No. 637,317. (No model.)

Claim.—1. In an article of the class described the combination with a seat, forward and rear legs pivoted to said seat and so connected together that they remain relatively parallel, arms pivoted to upwardly-extending portions of said rear legs and detachably secured to said seat, said arms being adapted to swing backward to uphold the parts in an inclined position and means for adjusting the inclination of said arms substantially as and for the purpose set forth.

2. In an article of the class described the combination with a seat, forward and rear legs pivoted to said seat and so connected together that they remain relatively parallel, arms pivoted to said rear legs and detachably secured to said seat, said arms being adapted to swing backward and rest on the floor at various angles of inclination, said arms, legs and seat being adapted to fold together into a compact form substantially as and for the purpose set forth.



604,157. CIRCUIT-CLOSER. WILLIS B. KENNEDY, Easton, Pa. Filed Mar. 20, 1893. Renewed Oct. 2, 1897. Serial No. 653,593. (No model.)

Claim.—1. In a circuit-closer, the combination with a bellows base, of oppositely-curved thermostatic plates located respectively in the opposite sides of the base, and forming terminals of an electric circuit, one being formed to rest below and the other above the normal temperature, adjustable terminals adjacent to the plates, and a manual closer on the base, substantially as described.

2. In a circuit-closer, the combination with a base, of a thermostatic plate thereon, a central manual closer, a perforated guard for the thermostat, and a cap for the manual closer engaging and securing the guard on the base, substantially as described.

604,158. FURNACE FOR STEAM-BOILERS. WILLIAM KENT, Passaic, N. J. Filed July 15, 1897. Serial No. 644,897. (No model.)

Claim.—1. A furnace for a steam-boiler comprising the furnace-chamber C built exterior to the boiler, the wing-walls E, E', the projecting piers H, the rear wall J, the mixing-chamber F, and the combustion-chamber G, substantially as shown and described.

2. In a steam-boiler furnace, the fire-chamber extending in front of the boiler, the combustion-chamber separated from said fire-chamber by a bridge-wall over which the products of combustion pass, the combustion-chamber in rear of said fire-chamber and provided with wing-walls at the sides and a rear wall extending upward to the boiler-tubes, and a partition-wall extending across the tubes, said combustion-chamber having fire-brick piers serving as radiators and having passages leading away from said chamber, all substantially as described.

3. In a steam-boiler furnace, the fire-chamber, the combustion-chamber connected thereto as described and provided with wing-walls at its sides by which the gases in passing backward are deflected toward the central part of the chamber, said combustion-chamber also having fire-brick piers serving as radiators, and passages leading from said combustion-chamber to water-containing parts of the boiler, all substantially as described.

4. In a furnace for a water-tube steam-boiler, said boiler having inclined tubes and transverse gas-passages, a fire-chamber in front of the boiler, a gas-mixing chamber in rear of the fire-chamber, the fire-chamber and the mixing-chamber both having a tile or fire-brick roof to prevent the direct access of the gases to the tubes of the boiler, wing-walls in the rear of the mixing-chamber, an open-top combustion-chamber in the rear of the mixing-chamber and partly separated therefrom by said wing-walls, through which open top the gases pass directly into the first or forward ascending transverse gas-passage leading across the tubes of the boiler, in combination substantially as described.

604,159. PIPE-COUPLING. FREDERICK A. PERLEY, Jr., Johnstown, Pa. Filed Sept. 1, 1897. Serial No. 650,253. (No model.)

Claim.—1. In a pipe-coupling, the combination of the pipes having reamed ends, the gasket between said ends, the collars around

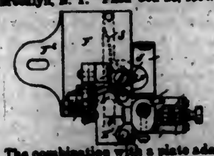
said ends, the projection upon one of said collars engaging the periphery of said gasket, and the flanges and bolts for compressing the gasket between the pipe ends and the said projection.

2. A pipe-coupling comprising the combination with the recessed and scored ends of the pipe members, of a ferrule within the registering recesses, a gasket between the scored ends, and means for compressing the gasket and securing the whole together.

604,160. FRAME CLAMP AND SUPPORT. FREDERICK REMMARE, West Point, N. Y. Filed Mar. 5, 1897. Serial No. 626,157. (No model.)

Claim.—1. In a locking frame-clamp, a fixed supporting-plate, a revoluble plate mounted thereon, each of said plates having journal-bearings, threaded shafts having gears on their inner ends journaled in said bearings, a central adjustable gear and means to throw it in and out of operative connection with the gears on the shafts, all combined as set forth.

2. As an improvement in locking frame-clamps, the combination of a vertical fixed plate having a central hub and a circular rack, a revoluble plate mounted thereon, threaded shafts journaled in said plate carrying miter-boxes, and operative means connected with the rack for revolving the revoluble table, all arranged as set forth.



3. As an improvement in locking-clamps for frames, the combination of a fixed support having suitable legs and a central upwardly-disposed hub, of a revoluble plate, operatively mounted on said hub; threaded shafts secured to said support and movable plate in the manner specified and having upon their inner ends a beveled gear designed to mesh with a central gear, which latter communicates movement from one shaft to another, and means for automatically raising the central gear when the thumb-screw secured thereto is raised, substantially as specified and for the purpose set forth.

4. As an improvement in frame-holding clamps, the combination of a fixed plate, a movable plate mounted thereon, each plate being provided with a pair of suitably-mounted threaded shafts, miter-boxes operatively connected with said shafts and adjustable thereon, gears secured to the inner ends of said shafts, a vertically-adjustable central gear meshing with each shaft-gear and means for operating one of said threaded shafts, all arranged as set forth.

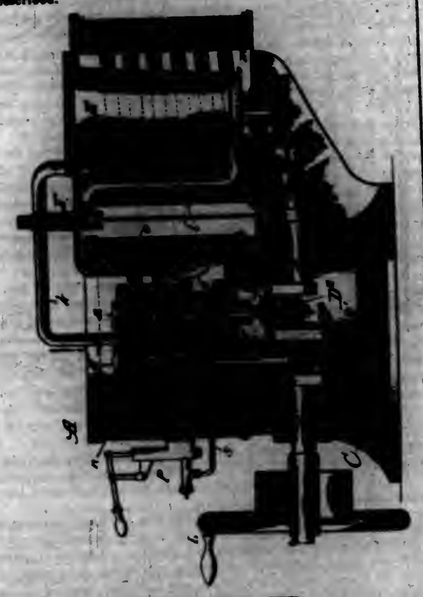
5. In a locking frame-clamp, a fixed supporting-plate having a vertical central hub provided with a downwardly-extending collar, a revoluble plate having a central aperture fitting over said hub, an axle extending through said collar and having an adjustable gear on its upper part and a spiral spring around its central portion and a thumb-screw whereby the gear may be thrown into and out of operative condition and means to operate said gear and screw-shafts with miter-boxes and gears cooperating with said gear all combined as set forth.

6. In a locking-frame, a fixed supporting-plate, a revoluble plate mounted thereon, shafts carrying miter-boxes and having gears on their inner ends, a central adjustable gear and devices whereby it is thrown into and out of operative connection with the inner end gears, all combined as set forth.

604,161. ATTACHMENT FOR SEWING-MACHINES. CARL SAMUELSON, Brooklyn, N. Y. Filed Oct. 26, 1897. Serial No. 656,626. (No model.)

Claim.—1. The combination with a plate adapted to be attached to the presser-foot of a sewing-machine, and having a recess opening toward the presser-foot, of a polygonal cam mounted to turn on a vertical axis in said recess, and also mounted so that its angles can be projected beyond the recessed edge of the plate, said cam having a vertical needle-slot in each angle and means for turning said cam a partial rotation for each stroke of the needle-bar, substantially as herein shown and described.

2. The combination with a plate adapted to be attached to the presser-foot of a sewing-machine, and having a recess opening toward the presser-foot of a polygonal cam mounted to turn on a vertical axis in said recess, and also mounted so that its sides can be brought in position successively in line with the recessed edge of the plate and its angles successively projected beyond said edge, said cam having a vertical needle-slot in each angle and means for rotating the cam for each stroke of the needle-bar to bring the cam from one position to the other, substantially as herein shown and described.



3. The combination with a plate adapted to be attached to the presser-foot of a sewing-machine and having a recess opening toward the presser-foot, of a polygonal cam mounted to rotate on a vertical axis within said recess, said cam having a vertical needle-slot in each angle, a ratchet-wheel fixed on said cam and having as many teeth as the cam has sides and angles, a pawl-lever engaging said ratchet-wheel, and means for operating said pawl-lever from the needle-bar of the sewing-machine, substantially as herein shown and described.

604,162. COOLING AND SEALING. JULIUS SIEGLAGHE, Nuremberg, Germany. Filed Sept. 27, 1897. Serial No. 653,215. (No model.) Patented in France Dec. 31, 1892, No. 228,560; in Germany Feb. 10, 1893, No. 68,773; in Italy Mar. 28, 1893, No. 1,194; in Austria-Hungary May 6, 1896, No. 1,880 and No. 5,697, and Aug. 30, 1896, No. 10,220 and No. 10,989; in Switzerland June 28, 1894, No. 8,796; in Belgium Aug. 25, 1894, No. 95,943, and in England May 14, 1895, No. 9,859.

Claim.—1. In a refrigerating-machine, the combination with the compressor and suction chamber of means for maintaining a predetermined pressure of leakage-gas behind the piston in the compressor-chamber greater than the pressure in the suction-chamber, said means comprising a tapering valve and a tapering valve-seat interposed between the two said chambers and presenting to said pressure behind the piston a smaller surface area and to said suction-pressure a larger surface area, said areas being relatively proportioned substantially as described.

2. In a refrigerating-machine, the combination of a compressor containing a pair of piston-chambers provided with a connecting-passage behind the pistons, a suction-chamber and means for maintaining a predetermined pressure of leakage-gas behind the pistons greater than the pressure in the suction-chamber, said means comprising a duct leading to the suction from said connecting-passage and containing a valve-chamber and a tapering valve having a tapering valve-seat in said chamber presenting a smaller surface area to said pressure behind the pistons and a larger surface area to said suction-pressure, said areas being relatively proportioned substantially as described.

3. In a refrigerating-machine, the combination with the condenser and refrigerator of a suction-chamber into which the refrigerator-coil discharges, a discharge-chamber connected with the condenser-coil, a compressor containing a pair of piston-chambers each having a valve-controlled connection with said suction-chamber and a valve-controlled connection with said discharge-chamber, and means for maintaining a predetermined pressure of leakage-gas behind the pistons greater than the pressure in the suction-chamber, said means comprising a duct communicating at one end with the piston-chambers behind the pistons therein and from its other end with said suction-chamber, and a tapering valve having a tapering valve-seat interposed in said duct and presenting a smaller surface area to said pressure behind the pistons and a larger surface area to said suction-pressure, said areas being relatively proportioned substantially as described.

604,163. UNDERGARMENT. ADOLPH G. VELASKO, Syracuse, N. Y. Filed Oct. 28, 1897. Serial No. 656,149. (No model.)

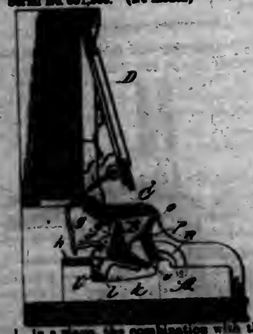
Claim.—In an [illegible] garment, the combination with the body, of a sleeve-piece having part of its end folded inwardly and doubling the fabric, a pad upon the body below the armhole, and means to secure this parts together around the armhole substantially upon the line of the fold upon the sleeve portion, whereby said pad and infold create an armpit-absorbent reinforced by said sleeve-fold at their meeting-points.

604,164. ROUNDABOUT. CHARLES T. WILDE and CHARLES W. HENDERSON, Lawrence, Mass. Filed Oct. 12, 1897. Serial No. 655,021. (No model.)

Claim.—1. In a roundabout, a tank, a fixed upright standard therein, a hub rotatably mounted upon the standard and having a series of radial arms, a boat connected with each arm, electric motor mechanism on one of said boats, a distant generator, electrically connected with the standard, a current-collecting brush on the hub, electrically connected with the motor mechanism, and a return-wire from the tank-water to the generator, the water completing the circuit, substantially as described.

2. In a roundabout, a tank, a fixed upright standard therein, supporting an insulated metallic contact-ring, an inclosing hub rotatably mounted on said standard and provided with an insulated collecting-brush, radial arms extended from the hub, a boat loosely connected with each arm, an electric motor on one of said boats, electrically connected with said brush and with the water, and a fixed generator in circuit with the contact-ring and the water in the tank, substantially as described.

3. In a roundabout, a tank, a central upright standard, a hub inclosing the standard and mounted to rotate on an antifriction-bearing, a plurality of radial arms extended from the hub, boats connected with and having vertical movement, relative to said arms, a fixed electric generator having one terminal electrically connected with the standard and the other with the water in the tank, and an electric propelling mechanism on one of said boats, electrically connected with the water and with a current-collecting brush within the hub, the arm to which said boat is connected carrying within it the circuit-wire between the boat and brush, substantially as described.



604,165. SPRING-HINGE. ALONZO D. ANTHONY, Groton, N. Y. Filed Aug. 30, 1897. Serial No. 649,945. (No model.)

Claim.—1. A spring-hinge, comprising a leaf having a case upon one edge, the upper portion of which is removed, a spindle having a head, and a ratchet formed thereon, a spring mounted on said spindle, and a second leaf having ears adapted to engage the ends of the case, and top of the spindle, and a pin, as set forth.

2. In a spring-hinge, the combination of a leaf having a case upon one edge, the upper portion of which is removed to form a bearing, a spindle having a head and ratchet thereon, a spring mounted on said spindle, one end of which is confined, a second leaf having perforated ears adapted to engage the ends of the case, and the top of the spindle, said ears and spindle having angular openings, and an angular pin adapted to engage said openings as set forth.

604,166. PIANO. WILLIAM M. BAUER, Chicago, Ill. Filed Sept. 11, 1897. Serial No. 651,202. (No model.)

Claim.—1. In a piano, the combination with the ledge of a fall-board formed of folding sections, the forward section, when raised, extending at its outer edge beneath the corresponding edge of the ledge to close the opening in the piano-frame, and a grip on said forward section, substantially as described.

2. In a piano, a fall-board comprising the section *p'* supported to ride on ways provided on the piano-key blocks, and the section *p* hinged to the section *p'* and having a grip at its forward edge and link connection with said blocks, said section *p* having a transverse dimension approximately equal to that of the opening between the key strip and ledge, and adapted to close said opening and to present its forward edge against the lower side of the ledge when the fall-board is opened, substantially as described.

3. In a piano, a fall-board comprising the section *p'* carrying rollers supported to ride on ways provided on the piano-key blocks, and the section *p* hinged to the section *p'* and having link connection with the said blocks and a grip at its forward edge, and a stop for the section *p'* whereby when the fall-board is opened the forward edge of the section *p* is brought into close proximity to the lower side of the piano-ledge to cover the opening in the piano-frame, substantially as described.

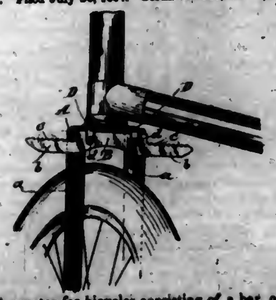
4. In combination with the fall-board and swinging front frame of an upright piano, mechanism for opening and closing the front frame by operating the fall-board, comprising a rock-shaft extending from side to side of the piano-case behind said frame and means for engaging therewith the fall-board, spring-sockets on said front frame and arms extending from said rock-shaft to engage with said sockets, substantially as described.

5. In combination with the fall-board and swinging front frame of an upright piano, mechanism for opening and closing the front frame by operating the fall-board, comprising a rock-shaft E having a depending arm *g* to be engaged by the fall-board and arms *f'* carrying rollers *f''*, and springs *e* forming sockets on the back of the front frame to be engaged by said rollers, substantially as described.

604,167. METHOD OF TREATING METALLIC ORES. STANLEY C. G. CURRIE, Montreal, Canada, assignor to himself, and EDWARD H. DICKERSON, New York, N. Y. Filed Feb. 19, 1897. Serial No. 624,276. (No specimens.)

Claim.—1. The process of extracting metals from their ores, which consists in treating the ore with a solution containing free chlorin and a hypochlorite, the former being in excess of the chlorin in the latter, substantially as described.

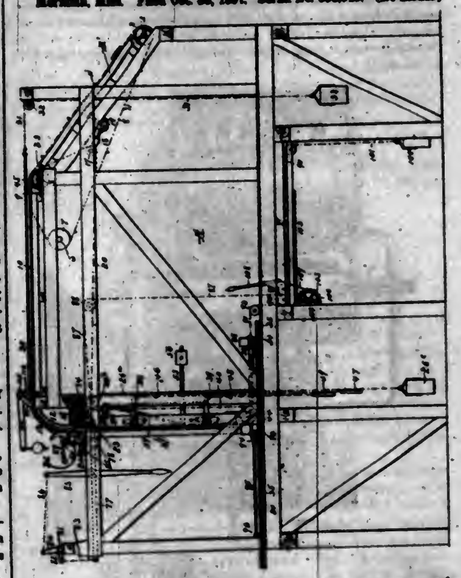
2. The process of extracting metals from their ores, which consists in treating the ore with a weak caustic solution which has been saturated with chlorin, whereby the free chlorin is in excess of the chlorin in the hypochlorite, substantially as described.



3. The process of extracting metals from their ores, which consists in treating the ore with a solution containing free chlorin, a hypochlorite and a chlorid, the free chlorin being in excess of the chlorin in the hypochlorite, and also in excess of the chlorin in the chlorid, substantially as described.

4. The new combination of matter, useful as a solvent for metals and metallic ores, consisting in a solution containing essentially free chlorin and a hypochlorite, the former being in excess of the chlorin in the latter, substantially as described.

5. The new combination of matter, useful as a solvent for metals and metallic ores, consisting in a solution containing free chlorin, a hypochlorite, and a chlorid, the free chlorin being in excess of the chlorin in the hypochlorite, and also in excess of the chlorin in the chlorid, substantially as described.



6. The new combination of matter, useful as a solvent for metals and metallic ores, consisting in an aqueous solution containing free chlorin and a hypochlorite, in which the proportion of the former to the chlorin in the latter is not less than three parts to one, substantially as described.

604,168. COASTER FOR BICYCLES. BRADFORD H. DIVINE, Utica, N. Y. Filed July 26, 1897. Serial No. 646,057. (No model.)

Claim.—A coaster for bicycles consisting of a bar, or plate-like piece of suitable dimensions to be applied transversely to the fork sides of a bicycle above the wheel, and, in said position, to extend beyond said fork sides, the said bar or plate-like piece being provided with metallic straps adapted to pass over or around the fork-crown of the bicycle for the purpose of securely attaching said piece to the said fork-crown substantially as shown and described.

604,169. LUMBER-STACKING APPARATUS. WILLIE GRAHAM, Meridian, Miss. Filed Oct. 30, 1897. Serial No. 656,913. (No model.)

Claim.—1. In a lumber-stacking machine, the combination with suitable framework having a platform, of ramping chains constructed and adapted to deposit lumber on said platform, means for supporting trucks in said framework, and chains constructed and adapted to move the lumber from said platform, and vertically-disposed chains having lugs thereon and adapted to deposit the lumber edgewise in tiers on said trucks, substantially as set forth.

2. In a lumber-stacking apparatus, the combination with suitable framework having a platform, of a series of chains passing over said platform and adapted to convey lumber from one end to the other thereof, a series of ramping chains constructed and adapted to deposit lumber onto the platform over said first-mentioned chains, and vertically-disposed lowering-chains arranged to receive lumber from the first-mentioned chains and deposit it in tiers onto a truck, substantially as set forth.

3. In a lumber-stacking apparatus, the combination with suitable framework having a platform, of wheels mounted at one end of said platform, sprocket-chains having lugs thereon passing over said wheels and over the platform, a frame in the platform adjacent to said wheels, and ramping chains extending over said frame and adapted to deposit lumber on the platform over said first-mentioned chains and forwardly of said wheels, substantially as set forth.

4. In a lumber-stacking apparatus, the combination with suitable framework having a platform, of a throat below the forward end of said platform, chains passing over said platform and into said throat, and two series of lugs on each of said chains and having faces at right angles to the chains, the lugs of one series alternating with the lugs of the other series, and the said angular faces of the lugs of one series being oppositely disposed to the angular faces of the other series, whereby one series of lugs will propel lumber forwardly and the other series resist the forward movement of the lumber, substantially as set forth.

5. In a lumber-stacking machine, the combination with suitable framework having a platform, of a series of sprocket-wheels at one end of said platform, a series of conveying-chains passing over said sprocket-wheels and over the platform, a frame under said chains in proximity to said sprocket-wheels and a series of ramping chains passing over said sprocket-wheels and said frame, and other sprocket-wheels below said frame, over which said ramping chains pass, substantially as set forth.

6. In a lumber-stacking apparatus, the combination with framework having a platform and means near the forward end of said platform for depositing lumber onto trucks, of a series of wheels at the rear end of the framework, a shaft at the rear end of the platform, wheels mounted loosely on said shaft, ramping chains passing over said wheels for depositing lumber onto said platform, a driving-shaft disposed below and forwardly of said first-mentioned shaft, a series of sprocket-wheels secured to the driving-shaft and over which said ramping chains pass, a second series of wheels mounted loosely on said first-mentioned shaft, chains passing over the platform and the last-mentioned wheels and means for driving said last-mentioned chains, substantially as set forth.

7. In a lumber-stacking apparatus, the combination with a framework having a platform, and means for depositing lumber onto said platform, of a series of chains passing over the platform below the upper surface thereof, two series of lugs having oppositely-disposed angular faces, on said chains, said lugs being of a length to terminate below the surface of the platform, and larger lugs also secured to said chains at intervals and adapted to engage lumber on the platform and move it forwardly to be conducted by said first-mentioned lugs toward stacking devices, substantially as set forth.

8. In a lumber-stacking apparatus, the combination with framework having a platform, of curved bracket-castings depending from the forward end of said platform, sprocket-wheels mounted at the lower ends of said castings, sprocket-wheels at the other end of the platform, idle-pulleys disposed below the last-mentioned sprocket-wheels and a series of conveying-chains passing over said sprocket-wheels, idle-pulleys and curved castings, substantially as and for the purpose set forth.

9. In a lumber-stacking apparatus, the combination with framework having a platform and means for supporting trucks, of a series of curved brackets or castings at the forward end of said platform, said brackets or castings having grooves, a series of chains passing over the platform and through the grooves of said brackets or castings, two series of lugs on each chain, the lugs of one series alternating with the lugs of the other series and the respective series of lugs having oppositely-opposed angular faces, and means intermediate of said chains and trucks for depositing lumber from said chains onto the trucks, substantially as set forth.

10. In a lumber-stacking apparatus, the combination with framework, adapted to receive trucks, of a throat located above the position occupied by said trucks, said throat having one wall rigid and the other wall yielding, substantially as set forth.

11. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks, of a throat located over the position occupied by the trucks, a movable timber forming one wall of said throat, and means attached to said timber and tending to cause it to press toward the other wall of the throat, substantially as set forth.

12. In a lumber-stacking apparatus, the combination with a framework adapted to receive trucks, of curved brackets or castings located above the position occupied by the trucks and forming one side of a throat, a movable timber forming the other side of said throat, and weights attached to said movable timber and tending to force it toward said brackets or castings, substantially as set forth.

13. In a lumber-stacking apparatus, the combination with a framework adapted to receive trucks, of a series of curved brackets or castings located above the position occupied by the trucks and forming one side of a throat, a movable timber forming the other side of said throat, ropes attached to said movable timber and passing over pulley mounted in the framework in rear of said brackets or castings and weights secured to the free ends of said ropes, substantially as set forth.

14. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks and having a platform, of a series of curved brackets or castings forming one side of a throat located above the position occupied by the trucks, a movable timber forming the other side of said throat, means for conveying lumber from said platform, through the throat and onto the trucks, a series of straps or ropes secured at one end to said movable timber passing over the platform and provided at their free depending ends with weights, substantially as set forth.

15. The combination with framework adapted to receive trucks, of a throat above the position occupied by the trucks, a movable timber forming one side of said throat and adapted to be yieldingly pressed toward the other side thereof, of guiding-brackets secured to the top of said movable timber and adapted to assist in guiding lumber through said throat, substantially as set forth.

16. The combination with a framework adapted to receive trucks and having a platform at its top, of an automatically-expansible throat above the position occupied by the trucks, means for conducting lumber from the platform through the throat and means for conducting lumber from the throat and depositing it upon the trucks, substantially as set forth.

17. The combination with a framework adapted to receive trucks and having a platform at its top, of a series of curved brackets or castings at one end of said platform and forming one side of a throat, a yielding timber forming the other side of said throat, beveled brackets secured to said timber and cooperating with said curved brackets or castings to direct lumber to the throat, means for conducting the lumber from the throat to the trucks, substantially as set forth.

18. The combination with a framework adapted to receive trucks, of a series of brackets or castings forming one side of a throat located above the position occupied by the trucks a movable timber forming the other side of the throat, brackets secured to the framework and having rods passing through said movable timber whereby, to support the latter, face-plates secured to said timber and having flanges surrounding said rods, substantially as set forth.

19. In a lumber-stacking apparatus, the combination with a framework, of a series of lowering-chains, a series of fixed uprights parallel with said chains, presser-bars supported by said uprights and means for pressing said presser-bars outwardly, whereby to keep the lowering-chains well up to the lumber being stacked on the trucks, substantially as set forth.

20. In a lumber-stacking apparatus, the combination with framework, of a series of lowering-chains, a series of yielding bars to press said chains outwardly, sprocket-wheels mounted in the framework over the presser-bars, for said chains, and pulleys carried by the lower ends of the presser-bars, over which said chains also pass, substantially as set forth.

21. In a lumber-stacking machine, the combination with framework, a series of sprocket-wheels, a series of yielding presser-bars, pulleys movably supported by the lower ends of said presser-bars and lowering-chains passing over said sprocket-wheels and pulleys, substantially as set forth.

22. In a lumber-stacking apparatus, the combination with a framework having a platform at its top, of a throat at one end of said platform, a shaft mounted in proximity to said throat, a series of sprocket-wheels on said shaft, conveying-chains passing over the platform, through said throat and over said sprocket-wheels, a second series of sprocket-wheels on said shaft, lowering-chains passing over said last-mentioned sprocket-wheels, and presser-bars adapted to bear against said lowering-chains, substantially as set forth.

23. In a lumber-stacking apparatus, the combination with a series of lowering-chains and a series of fixed uprights disposed parallel therewith, of crank-arms mounted in said uprights, bars pivotally connected with said crank-arms and adapted to press the lowering-chains outwardly, substantially as set forth.

24. In a lumber-stacking apparatus, the combination with a series of lowering-chains, a series of fixed uprights bell-crank levers pivotally connected to said fixed uprights, presser-bars for said lowering-chains, pivotally attached to one arm of the respective bell-crank levers, and weighted cords attached to the other arms of said bell-crank levers, substantially as set forth.

25. In a lumber-stacking apparatus, the combination with trucks and means for stacking lumber edgewise thereon, of a series of presser-bars constructed to bear against the lumber outwardly and downwardly, substantially as and for the purpose described.

26. In a lumber-stacking apparatus, the combination with trucks and means for stacking lumber edgewise thereon, of a series of fixed uprights, bell-crank levers pivotally connected to said uprights, one arm of each bell-crank lever being adapted to project upwardly, presser-bars connected with said upwardly-projecting arms of the bell-crank levers and adapted to bear against the lumber, and a weight connected with the other arms of said bell-crank levers, substantially as set forth.

27. In a lumber-stacking apparatus, the combination with trucks and means for stacking lumber edgewise thereon, of fixed uprights, bell-crank levers pivotally connected to said uprights and each having one arm projecting upwardly, presser-bars pivotally connected to said upwardly-projecting arms of the bell-crank levers, a rod or bar connecting the other arms of said bell-crank levers, a crank-shaft connected with said rod or bar, a weighted lever, and a connection between said weighted lever and said crank-shaft, substantially as set forth.

28. In a lumber-stacking apparatus, the combination with means for stacking lumber edgewise, of a series of yielding presser-bars adapted to bear against the lumber being stacked, and holders for spacing-sticks carried by said presser-bars, substantially as set forth.

29. In a lumber-stacking apparatus, the combination with means for stacking lumber edgewise, of a spacing-stick holder consisting of a pivoted angular lever having one arm adapted to press against the spacing-sticks and a weight on the other arm of said angular lever, substantially as set forth.

30. In a lumber-stacking apparatus, the combination with means for stacking lumber edgewise, of a spacing-stick holder consisting of an angular lever having one arm adapted to press against the lumber being stacked, a weight on the other arm of said angular lever, and

an operating-lever secured to said angular lever, substantially as set forth.

31. In a lumber-stacking apparatus, the combination with means for stacking lumber, edgewise, of yielding presser-bars adapted to bear against the lumber being piled, an angular lever pivotally attached to each of said presser-bars, one arm of said lever being adapted to hold a spacing-stick, and a weight on the other arm of said angular lever, substantially as set forth.

32. In a lumber-stacking apparatus, the combination with means for stacking lumber edgewise, of yielding presser-bars, angular levers pivotally attached to said presser-bars, one arm of each angular lever being adapted to hold a spacing-stick, a weight on the other arm of said angular lever, an operating-lever secured to each angular lever, and a pin on each presser-bar adapted to receive said operating-levers and hold the angular levers withdrawn when not in use, substantially as set forth.

33. In a lumber-stacking apparatus, the combination with framework having a throat for the passage of lumber to be attached on trucks having standards, of guide-plates secured to the timber at one side of said throat, vertically-movable stops for spacing-sticks and the truck-standard, mounted in said guide-plates, and means for raising said stops out of the path of the upper ends of the truck-standards and spacing-sticks, substantially as set forth.

34. In a lumber-stacking apparatus, the combination with framework having a throat for the passage of lumber to be stacked on trucks having standards, of a series of guide-plates secured to the timber at one side of said throat, vertically-movable stops for spacing-sticks and the truck-standards, mounted in said guide-plates, and a crank-shaft mounted on said timber and connected with said stops whereby to raise them out of the path of said spacing-sticks and truck-standards, substantially as set forth.

35. In a lumber-stacking apparatus, the combination with framework, and trucks having standards, of a movable transverse timber and means for causing said transverse timber to bear yieldingly against the upper ends of said truck-standards, substantially as set forth.

36. In a lumber-stacking apparatus, the combination with a framework and trucks having standards, of a movable transverse timber adapted to bear against said truck-standards, cords attached to said transverse timber and passing over pulleys mounted in the framework, and weights connected with said cords, substantially as set forth.

37. In a lumber-stacking apparatus, the combination with framework and trucks having standards, of a transverse movable timber adapted to bear against said truck-standards, guide-rods for said transverse timber, said guide-rods being pivoted at their inner ends to the framework and means connected to the outer ends of said guide-rods whereby to raise them and move said transverse timber out of the path of the upper ends of the truck-standards, substantially as set forth.

38. In a lumber-stacking apparatus, the combination with framework and trucks having standards, of a yielding transverse bar to bear against the truck-standards and means for raising said transverse bar out of the path of said truck-standards, substantially as set forth.

39. In a lumber-stacking apparatus, the combination with framework and trucks having standards, of a yielding transverse timber adapted to bear against said standards, guide-rods for said transverse timber, said guide-rods being pivoted at their inner ends, a crank-shaft mounted above the free ends of said guide-rods, a pivoted operating-lever and a connection between said operating-lever and said crank-shaft, substantially as set forth.

40. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks, of movable knees to engage said trucks, and weights connected with said movable knees, substantially as set forth.

41. In a lumber-stacking apparatus adapted to receive trucks, the combination of guide-rods disposed to one side of the path of movement of said trucks, knees adapted to move on said guide-rods and to be turned to engage the trucks, and weights connected with said knees, substantially as set forth.

42. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks, of guide-rods disposed to one side of the path of movement of said trucks, knees mounted on said guide-rods, each knee comprising a sleeve to slide and to turn on said guide-rods, and two lugs on said sleeve, one of said lugs being adapted to engage the truck and the other to act as a treadle, and weights connected with said knees, substantially as set forth.

43. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks having standards of a movable transverse timber adapted to bear against the upper ends of the truck-standards, a series of movable knees adapted to engage the trucks, connections between said transverse timber and said knees, means for feeding and stacking lumber onto said trucks and means for regulating the tension on said transverse timber and knees to accommodate the thickness of the lumber being stacked on the trucks, substantially as set forth.

44. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks, of a series of movable knees adapted to engage the trucks, weights connected with said knees means for stacking lumber on said trucks, and brake devices constructed and adapted to regulate the tension on said knees to accommodate the trucks for receiving lumber of different thicknesses, substantially as set forth.

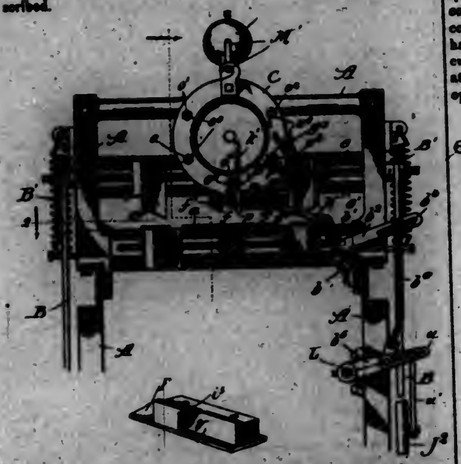
45. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks and means for stacking lumber on said trucks, of movable devices mounted in the framework and adapted to press against the trucks, a friction-brake connected with said movable devices and a lever for controlling said brake, substantially as set forth.

46. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks, and means for stacking lumber on said trucks, of movable devices mounted in the framework and adapted to press against the trucks, a rack-bar connected with said movable devices, a shaft, a pinion on said shaft and meshing with said rack-bar, a brake-wheel also on said shaft, a brake-band on said brake-wheel and a lever for operating said brake-band, substantially as set forth.

47. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks and means for stacking lumber on said trucks, of movable knees adapted to bear against said trucks, a movable transverse bar mounted in the framework, flexible connections between said movable transverse timber and said knees, pulleys located in rear of said movable transverse timber, cords attached to said timber and passing over said pulleys and weights on the depending ends of said cords, substantially as set forth.

48. In a lumber-stacking apparatus, the combination with framework adapted to receive trucks having standards, of an upper movable transverse timber adapted to bear against said standards, movable knees to engage said trucks, a lower movable transverse timber, flexible connections between said movable transverse timbers, and weights connected to said lower movable transverse timber to pull the same rearwardly, substantially as set forth.

49. In a lumber-stacking apparatus, the combination with framework having a platform, of ramping chains for depositing lumber on the platform, conveying-chains for moving the lumber over the platform and lowering-chains for depositing the lumber, in tiers, of a driving-shaft for the ramping chains, a driving-shaft common to the conveying-chains and the lowering-chains, a pulley mounted and a sprocket-wheel mounted loosely on said last-mentioned shaft, a clutch for securing the pulley to its shaft, a separate clutch for securing said sprocket-wheel to the same shaft, a sprocket-wheel on the driving-shaft of the ramping chains, and a sprocket-chain connecting said sprocket-wheels, substantially as set forth.



50. In a lumber-stacking machine, the combination with a frame having a platform, means for depositing lumber on said platform, means for receiving lumber from said platform and stacking it, and devices for positively moving said lumber from the platform, of yielding devices adapted to bear against the end board of the lumber on the platform and prevent said lumber from leaving the platform until moved positively by the devices provided for that purpose, substantially as set forth.

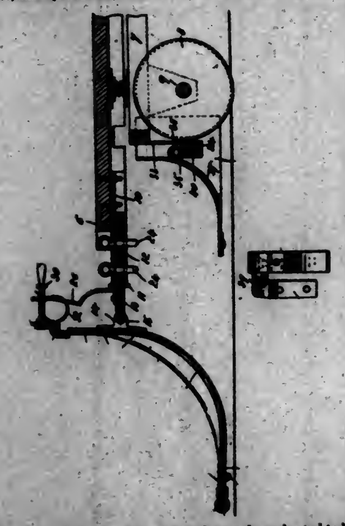
51. In a lumber-stacking machine, the combination with a frame having a platform, means for depositing lumber on the platform, means for receiving lumber from the platform and stacking it and means for positively moving said lumber from the platform to the stacking appliances, of a shaft mounted over the platform, a series of arms projecting from said shaft and adapted at their free ends to engage the first board of the timber on the platform, an arm projecting forwardly from said shaft and a weight at the free end of said last-mentioned arm whereby to force the first-mentioned arms against the last board of the lumber on the platform with a yielding pressure, substantially as set forth.

604,170. BOOKBINDING-MACHINE. FREDERIC P. HILL, Chicago, Ill. Filed Dec. 10, 1897. Serial No. 661,620. (No model.)

Claim.—1. In combination with a book-cover machine of the character set forth, an attachment adapted to be supported on the reciprocating cutter-head *e* of said machine, for cutting and applying the lining H, said attachment comprising a roll for the web of material for said lining, feed mechanism for feeding at intervals material from said roll, a cutter device operated by the descent of said cutter-head to sever from said web the fed section thereof forming a lining-strip, and a spring-actuated presser-plate released by the action of said cutter device to apply said strip, substantially as described.

2. In combination with a book-cover machine of the character set forth, an attachment, supported on the reciprocating cutter-head *e* of said machine, for cutting and applying the lining H, said attachment comprising a spring-controlled pivotally-supported blade having a handle to bear against the bed of the machine in the descent of said cutter-head and thereby actuate the blade to sever from said web the fed section thereof forming a lining-strip, and a spring-actuated presser-plate operating to apply said strip, substantially as described.

3. In combination with a book-cover machine of the character described, an attachment, supported on the reciprocating cutter-head *e* of said machine, for cutting and applying the lining H, said attachment comprising a roll for the web of material, a cutter device having a spring-controlled pivotal blade actuated by the descent of said cutter-head to sever from said web the fed section thereof forming a lining-strip, and a presser-plate on a spring-pressed reciprocating carrier carrying a spring-dog to engage a catch and projecting into the path of said blade to be tripped thereby, substantially as described.



4. In combination with a book-cover machine of the character described, an attachment, supported on the reciprocating cutter-head *e* of said machine, for cutting and applying the lining H, said attachment comprising a roll for the web of material for said lining, feed mechanism for feeding at intervals material from said roll, a cutter device having a spring-controlled pivotal blade actuated by the descent of said cutter-head to sever from said web the fed section thereof forming a lining-strip, a cam on said blade and a pivotal finger thereon engaging at one end with the attachment-frame, and a presser-plate on a spring-pressed reciprocating carrier engaged by the free end of said finger and carrying a spring-dog projecting at one end into the path of said cam and engaging at its opposite end with a catch, substantially as described.

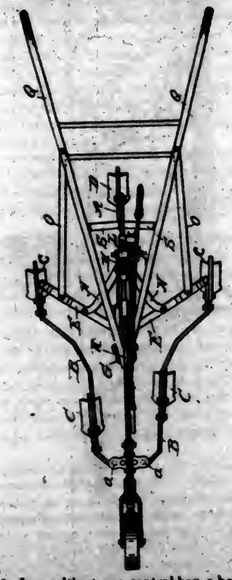
5. In combination with a book-cover machine of the character described, an attachment, supported on the reciprocating cutter-head *e* of said machine, for cutting and applying the lining H, said attachment comprising heads between which are supported a roll for the web of material for said lining and feed-rolls for said web, a cutter device having a pivotal spring-controlled blade provided with a handle to engage with the bed of said machine and carrying a pivotal finger engaging at one end with one of said heads and containing a cam-recess, a presser-plate on a spring-pressed reciprocating carrier engaged by the free end of said finger and carrying a spring-dog projecting at one end into the path of said cam-recess and engaging at its opposite end with a catch, and means for actuating said feed-rolls, substantially as described.

6. An attachment for a book-cover machine for cutting and applying the lining H, comprising, in combination heads connected together at intervals by rods and provided with recesses extending upward from their lower edges, a roll for the material G, and feed-rolls I and I' supported between said heads, a cutter D pivotally supported near one end to extend through said slots and connected with a spring *k'* at its free end and having a handle portion provided with a roller *q*, a finger *f'* pivoted on the cutter-blade and engaging at one end with a head, a cam-recess *i* in the blade, a carrier F' supporting a presser-plate *l'* and reciprocally supported on one of said rods and having a flange *f*⁵ engaged by the opposite end of said finger and carrying a spring-dog *f*⁶, a spring *f*⁷ engaging the carrier F', a catch *f*⁸ engaging said dog, and a stationary cutter *n*, substantially as described.

7. In combination with a book-cover machine of the character described, an attachment supported on the reciprocating cutter-head *e* of said machine, for cutting and applying the lining H, said attachment comprising heads C C' C² and C³ connected at intervals by rods, a roll for the material G and feed-rolls I and I' supported between said heads, a gear *d* on a stud *v* on the head C³ meshing with a pinion *d'* on the roll I, and a gear *d*² on said roll meshing with a gear *d*³ on the roll I', a lever K fulcrumed on said stud and carrying the spring-pawls *v'* and *v*² engaging with said gear *d*, said lever being connected with the rock-shaft L of the machine, stops *f f*, a cutter D comprising a spring-controlled pivotally-supported blade, having a handle to bear against the bed of the machine in the descent of said cutter-head, and a presser-plate F on a spring-pressed carrier F' actuated by said blade, the whole being constructed and arranged to operate substantially as described.

604,171. FENDER OR GUARD FOR TRAMWAY-CARS. JOSEPH LIGHTHAM, Reading, Pa., assignor of three-fourths to Joseph Stamber, same place, and Edward Leightham, Harry Leightham, and Allen Leightham, Conshohocken, Pa. Filed July 27, 1897. Serial No. 646,033. (No model.)

Claim.—1. In a car-fender, a plate or bar adapted to be attached to the car-body, a circular head thereon having a circular chamber opening outwardly, a plate removably mounted in said chamber, a pin or pins whereby said plate is secured within said chamber, a fender or guard pivotally connected with the outer end of said plate, said fender being curved downwardly and outwardly and in close proximity to the rails and means whereby said fender may be swung on its pivots from the platform of the car, substantially as described.



2. A car provided with a plate or bar which is secured to the bottom of the platform thereof, and on which is formed a circular head which projects therefrom, said head being also provided with a circular chamber which opens outwardly, a plate mounted in said chamber and connected with said head by a pin or pins which are passed therethrough, and a fender or guard pivotally connected with the outer end of said plate, said fender or guard being curved downwardly and forwardly, and being adapted to be held in proximity to the rails of the track, and means for adjusting or raising and lowering the forward part of said fender or guard, consisting of an arm which extends upwardly from said plate, a screw-threaded bolt or shaft which passes through the upper end of said arm, and through an upright or standard connected with the upper portion of said fender or guard, and means for operating said bolt or shaft, substantially as shown and described.

3. A car provided with a plate or bar which is secured to the bottom of the platform thereof, and on which is formed a circular head which projects therefrom, said head being also provided with a circular chamber which opens outwardly, a plate mounted in said chamber and connected with said head by a pin or pins which are passed therethrough, and a fender or guard pivotally connected with the outer end of said plate, said fender or guard being curved downwardly and forwardly, and being adapted to be held in proximity to the rails of the track, and means for adjusting or raising and lower-

ing the forward part of said fender or guard, consisting of an arm which extends upwardly from said plate, a screw-threaded bolt or shaft which passes through the upper end of said arm; and through an upright or standard connected with the upper portion of said fender or guard, and means for operating said bolt or shaft, said fender or guard being also provided with rings or handles which are connected with the top thereof, substantially as shown and described.

4. A car provided with a plate or support which is secured to the bottom of the platform thereof, and a plate connected therewith by means of pins or bolts, a main fender or guard pivotally connected with the forward end of said last-named plate and adapted to swing vertically, an arm connected with said last-named plate and projecting upwardly, a screw-threaded bolt passing through the upper end thereof, and through an attachment connected with the upper part of the main fender or guard, and means for operating said bolts so as to raise or lower the front end of said fender or guard, substantially as shown and described.

604,172. CULTIVATOR. DAVID M. MOTHERWELL, Chicago, Ill., assignor to the Whitman & Barnes Manufacturing Company, Akron, Ohio. Filed Nov. 24, 1896. Serial No. 613,256. (No model.)

Claim.—1. In a cultivator, a central bar, a handle-frame extending therefrom, a pair of side frames adjustable toward and from said central bar, a pair of spreading links connected at their outer ends to said side frames, the guides for the inner ends of said links curved outwardly and rearwardly, in combination with braces connecting said links with stationary points, for the purpose specified.

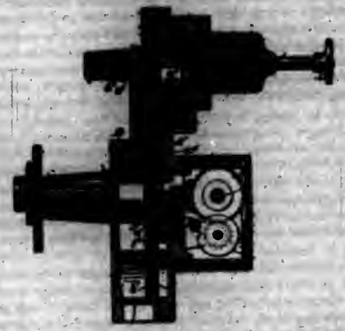
2. In a cultivator, a central bar, a handle-frame extending therefrom, a pair of side frames adjustable toward and from said central bar, a pair of spreading links connected at their outer ends to said side frames and having their inner ends guided in curved paths, in combination with means for causing said inner ends to move in the said paths and for locking them in desired position therein, and braces connecting said links with stationary points, for the purpose specified.

3. In a cultivator, in combination, a central bar, a handle-frame extending therefrom, a pair of side frames adjustable toward and from said central bar, a pair of links connected at one end with the side frames and having their other ends guided in a curve flaring outwardly as it extends rearwardly, links connecting said spreading links with an operating-lever and means for locking the operating-lever in desired points, for the purpose specified.

4. In a cultivator, in combination, a central bar, a pair of side frames adjustable toward and from said central bar, a spreading device having rigid links connecting said side frames with the central bar and adapted to spread the side frames while keeping them in substantially the same plane of elevation and without flexion in said links, and brace-rods connected to the central bar by fixed pivots and pivotally connected to the spreading device at points intermediate of the ends of said links which move substantially in the arc of a circle about such fixed points, for the purposes specified.

5. In a cultivator, in combination, a central bar, a side frame adjustable toward and from said central bar, a spreading link connected to said side frame and to a link leading to an operating-lever, and guides curved outwardly and rearwardly, for the purposes specified.

6. In a cultivator, in combination, a central bar, a pair of side frames adjustable toward and from said central bar, a pair of links connecting the side frames and central bar and having their inner ends guided by a block secured to the central bar in paths flaring rearwardly and means for moving the links, for the purpose specified.



7. In a cultivator, in combination, a central bar, a pair of side frames adjustably connected therewith, a pair of spreading links connecting said side frames with said central bar, the inner ends of said links sliding in paths diverging from the central bar, an operating-lever mounted on the central bar and a pair of links each pivoted at one end to the operating-lever and connected at the other end to the spreading link, for the purpose specified.

8. In a cultivator, in combination, a central bar, a pair of side frames adjustably connected therewith, a pair of spreading links connecting said side frames with said central bar, each of said links consisting of two bars one above the other, the inner ends of said bars being connected together by a bolt which passes through a slot in a piece secured to the central bar, an operating-lever and a link connecting the lever and the bolt, for the purpose specified.

9. In a cultivator, the combination with a central bar of a block having guides curved outwardly and rearwardly, for the purpose specified.

10. In a cultivator in combination with the central bar, a block having flaring slots and an upwardly-extending lug, spreading links pivotally mounted in said slots and extending rigidly to and pivotally connected with the side frames of the cultivator, and handle-bars attached at their lower ends to the lug upon said block, substantially as and for the purposes specified.

604,173. PREPAYMENT ATTACHMENT FOR METERS. SAMUEL R. MOWER, New Haven, Conn., assignor to Henry C. Thompson & Son, same place. Filed Oct. 20, 1897. Serial No. 655,764. (No model.)

Claim.—1. A prepayment attachment consisting of a frame, a shaft therein rotated by the actuating parts of a meter; a coin-carrier made as a wheel having pockets and means between said shaft and coin-carrier to rotate it positively, combined with a movable coin-feeder arranged at the side of said wheel and having a coin-receiving opening, means to act on the coin in said feeder and force it into the openings of the coin-carrier, and a locking device cooperating with the openings of the coin-carrier to arrest the motion of said carrier when a coin is absent from the carrier, substantially as described.

2. In a prepayment attachment for a meter, a frame containing a shaft adapted to be rotated by the actuating parts of a meter, a coin-carrier having openings to receive coin, means between said shaft and said coin-carrier to move the latter positively, and a coin-feeder having an opening to receive coin, combined with a spring-pressed plunger adapted to act on the coin in the said coin-feeder and force said coin into the openings of the coin-carrier, and a locking device cooperating with the opening of the coin-carrier when coin is absent therefrom, substantially as described.

3. In a prepayment attachment for a meter, a frame containing a shaft adapted to be rotated by the actuating parts of a meter, a coin-carrier having openings to receive coin, means between said shaft and coin-carrier to move the latter positively, and a coin-feeder having an opening to receive coin, combined with a spring-pressed plunger adapted to act on the coin in the said coin-feeder and force said coin into the openings of the coin-carrier, said plunger being grooved at its end and being of a diameter to enter the opening of the coin-carrier when the coin is exhausted therefrom, and a locking device also entering an opening of the said coin-carrier, and the groove of the said plunger, substantially as described.

4. In a prepayment attachment for a meter, a frame containing a shaft adapted to be rotated by the usual actuating parts of a meter, a coin-carrying wheel in said frame and provided with openings for coin, gearing between said shaft and coin-carrier to rotate it positively, a coin-feeder to feed coin into the openings of said coin-carrier, a locking device to restrain the rotation of said coin-carrier until rendered inoperative by the presence of coin in the carrier, combined with a coin-discharging device arranged to act against each coin in succession after said coin has rendered the said locking device inoperative, said coin-discharging device discharging the coin from the said coin-carrier, and a casing having a receptacle to receive the said discharged coin, substantially as described.

5. In a prepayment attachment for a meter, an attachment-frame, a shaft adapted to be rotated by the actuating parts of a meter, a toothed coin-carrying wheel having openings to receive coin; gearing between said shaft and coin-carrier by which to rotate it positively; a coin-feeder to receive coin and supply it to the openings of said coin-carrier, a plunger to act upon the coin in the coin-feeder and discharge it therefrom into a chamber of the attachment-frame and thence into the openings of the coin-carrier, combined with a spring-actuated locking device arranged at one side of said coin-carrier, a coin-discharging device arranged at the opposite side of said carrier, and a receptacle to receive the discharged coin, substantially as described.

6. In a prepayment attachment for a meter, an attachment-frame, a shaft mounted therein and adapted to be rotated by the actuating parts of a meter, a coin-carrier having a plurality of coin-openings and mounted in said frame and actuated by said shaft, an independent spring-actuated locking device normally acting to enter and restrain the movement of said coin-carrier when coin is absent therefrom, means to act on one or a series of coin held in a pile at the side of said coin-carrier opposite the opening entered by said locking device and put the endmost coin of the series into the opening of the coin-carrier, the entrance of said coin into the coin-carrier displacing the said spring-actuated locking device, thus releasing the coin-carrier and permitting the meter to start, substantially as described.

7. In a prepayment attachment for a meter, a frame adapted to be attached to a meter and composed of a back plate having a passage for the used coin, a front plate having a chamber to receive and hold a supply of coin to be used, and a dividing-wall separating said two plates, said wall having a passage through which the coin from the coin-carrier escapes, a coin-carrier having openings for the reception of the coin, means to move said coin-carrier between the said front plate and said dividing-wall from the position where the coin-carrier receives coin into a position opposite the discharge-opening of said dividing-wall, said front plate and dividing-wall by contact with said coin keeping it in the coin-opening of said carrier, and means to put the coins lying in said front plate into an exposed opening of said coin-carrier, and an independent locking device located at the opposite side of said coin-carrier in line with the path of movement of the means employed to put the said coins into said coin-carrier, an incoming coin acting on and displacing said locking device to release the coin-carrier, substantially as described.

8. In a prepayment attachment for a meter, a frame provided with a shaft adapted to be rotated by the actuating parts of the meter, a coin-carrier having openings to receive coin, a coin-feeder to supply said openings with coin, a locking device to enter a coin-receiving opening of said coin-carrier and restrain the rotation of the same in the absence of coin, coin-discharging device to discharge a coin from said opening, it having performed its function of releasing the locking device; a recording device to indicate the quantity of gas delivered, and means between said shaft and said coin-carrier and recording device whereby one and the same shaft becomes the mover for both the coin-carrier and the recording device to operate, substantially as described.

9. In a prepayment attachment for a meter, a frame adapted to be secured to the meter; a movable coin-carrier having openings to receive, carry and deliver coins; a recording device composed of disks figured at their peripheries to enable the amount of gas consumed to be readily read at the face of said attachment-frame in a straight line, a toothed wheel connected with the disk-shaft of said recording device; a driving-shaft mounted in said attachment and adapted to be moved from the actuating parts of a meter; a gear on said driving-shaft to engage a gear on said disk-shaft; means actuated by said driving-shaft to move said coin-carrier; a cam on said driving-shaft, a main locking device cooperating with the openings of the coin-carrier, an auxiliary locking device intermediate said main locking device and the said cam to positively restrain the rotation of the said shaft when the main locking device stands in an opening of the coin-carrier, said parts being constructed and combined, substantially as described, whereby one and the same shaft moves simultaneously the coin-carrier and recording device, to step and start the coin-carrier and recording device simultaneously, the auxiliary locking device checking the rotation of the said shaft on the absence of coin in the coin-carrier, substantially as described.

10. In a prepayment attachment for a meter, a frame combining a movable coin-carrier having openings to receive coins and deliver them after having effected the starting of the coin-carrier; a shaft rotated by the mechanism of any usual meter, means between said shaft and coin-carrier to move it, a cam fixed to and carried by the said shaft, combined with a locking device adapted to engage the cam on said shaft and by abutting against it stop the rotation of said shaft after the coins in the coin-carrier have been exhausted therefrom, substantially as described.

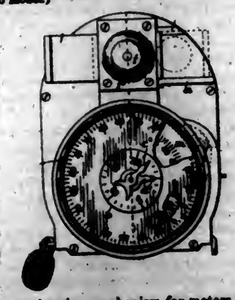
11. In a prepayment attachment for a meter, a frame adapted to be attached to a meter; a movable coin-carrier having openings to receive and carry coins to point of delivery; a shaft rotated by the mechanism of any usual meter, and means between it and said coin-carrier to actuate the latter, a cam carried by said shaft, a main locking device to enter an opening of the coin-carrier when a coin is absent therefrom, combined with an auxiliary locking device under the control of said main locking device and adapted to cause the auxiliary locking device to engage said cam and prevent the rotation of said shaft when the main locking device stands in an opening of the coin-carrier, substantially as described.

12. In a prepayment attachment for a meter, a frame composed of front and back plates separated by a dividing-wall having a slot; a coin-carrier having openings for the reception of coins, said front plate and dividing-wall lying close to the opposite sides of said coin-carrier and serving to keep the said coin in said carrier; combined with a locking device located in said slot and adapted to enter an opening in said coin-carrier when said opening arrives opposite said locking device and is without coin, substantially as described.

13. In a prepayment attachment for a meter, a frame composed of front and back plates, and an intermediate dividing-wall having a discharging-opening b^2, the back plate having a receptacle for the discharged coin, the edges of said opening being beveled, as at b^{20}, to offset the ready passage of coin through said opening b^2, combined with a coin-carrier having openings to receive coin, and a discharging device to discharge coin from said coin-carrier through the opening b^2 of the dividing-wall, substantially as described.

14. In a prepayment attachment for a meter, a frame adapted to be attached to a meter, a coin-carrier located and made movable in said frame, and provided with openings to receive coin, said openings being beveled at one side for the easy entrance of coin therein, combined with a coin-feeder and means to transfer coin from said feeder into said coin-carrier, substantially as described.

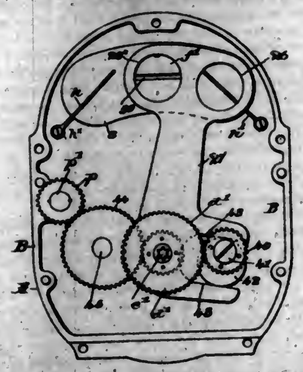
15. In a prepayment attachment for a meter, a frame adapted to be attached to a meter, said frame consisting of a back plate having a chamber for the reception of used coin, a front plate having a chamber for the reception of coin, and having a smooth bearing-face c^1, a dividing-wall having a discharge-opening b^2 for the coin, a coin-carrier having openings for the reception of coin from the coin-receiving opening of the front plate, said coin-carrier being of the same thickness as the coin to be handled in the attachment, the space between said smooth bearing-face and the adjacent face of the said dividing-wall being also equal in thickness to that of the said coin-carrier and the coin therein, whereby said coin is kept upright and is guided positively at both sides while being carried by the coin-carrier from the place where it is supplied with coin to the point where the coin is discharged therefrom, substantially as described.



16. In a prepayment attachment for a meter, a frame presenting a back plate provided with a passage for the used coin, a front plate presenting a chamber to receive one or more coins, a movable coin-feeder having an opening to be supplied with coin in one position and to place the coin in said opening opposite the chamber in said front plate in its other position, a coin-carrier, and an independent locking device combined with a plunger to act on the coin in said feeder and put it in the chamber of the front plate from which chamber said coins are taken in succession by the coin-feeder, said plunger continuing to act on said coin until the last coin has been put into the coin-carrier, substantially as described.

17. In a prepayment attachment for a meter, a frame, a coin-carrier having a plurality of openings to receive coin; a locking device entering one of said openings to hold said coin-carrier at rest when the coin is exhausted therefrom; and a discharging device cooperating with said coin-carrier to discharge a coin from said carrier after the same has been started in motion by the reception of a coin; and means to supply coin into an opening of said coin-carrier, the incoming coin removing the locking device from the opening of

the coin-carrier and permitting the latter to start, substantially as described.



18. In a prepayment attachment for a meter, a frame composed of a front plate, a back plate, and a dividing-wall, the latter having a slot for the passage therethrough of a locking device; a locking device movable in said slot, a coin-carrier having coin-openings and contained in said frame and substantially filling the space between said front plate and dividing-wall, said locking device entering an opening in said coin-carrier when a coin is absent therefrom; combined with means carried by said frame and located directly in line with the slot in said dividing-wall through which said locking device works, said means acting to put a coin into an opening in said coin-carrier and force said coin firmly in contact with said dividing-wall, and at the same time displace said locking device to enable the coin-carrier to be started; and a recording device also carried by said frame and moved in unison with said coin-carrier, substantially as described.

604,174. REGISTERING MECHANISM FOR METERS. SAMUEL R. MOWER, New Haven, Conn., assignor to Henry G. Thompson & Son, same place. Filed July 15, 1896. Renewed Dec. 14, 1897. Serial No. 661,585. (No model.)

Claim.—In a registering mechanism for meters, a series of concentric shafts having pointers, and a series of concentric graduated dials having a different number of teeth, the outer dial having an opening through which the graduations on the rear dial can be read, and a pointer, a shaft deriving its motion from the mechanism of a meter, and gearing actuated by said shaft to actuate said shafts and dials, substantially as described.

604,175. COIN-CONTROLLING AND RECORDING MECHANISM FOR METERS. SAMUEL R. MOWER, New Haven, Conn., assignor to Henry G. Thompson & Son, same place. Filed Mar. 13, 1897. Renewed Mar. 21, 1898. Serial No. 674,091. (No model.)

Claim.—1. In a coin-controlled meter, a front and a back plate, a separator-plate located between them and provided with two coin-discharging openings separated by a smooth or plain surface of the said plate, the said smooth surface acting to receive against it one side of a coin while being transferred from the coin-feeder into discharging position, a to-and-fro-movable coin-carrier made as a lever and located between said front plate and separator-plate, the thickness of the said lever being substantially equal to the thickness of the coin used or controlled by it, said coin-carrier having two coin-receiving openings; a coin-feeder to receive a series of coins, means acting on said coins to transfer them one at a time from said feeder into one and then into the other of the holes of the coin-carrier, means to positively move the said coin-carrier to and fro across the coin held in the coin-feeder, whereby said coin-carrier is enabled to take and have discharged from it a coin in each direction of its movement, the sides of the coin while being taken from a position opposite the coin-feeder into a position opposite the discharge-openings of the separator-plate being engaged both by the said separator-plate and the front plate, substantially as described.

2. In a coin-controlled meter, a power-driven shaft of a meter, a coin-carrier composed of a pivoted elbow-lever having coin-openings and a slot, and a locking device to enter either one of said coin-openings to lock the coin-carrier, combined with an eccentric located in the slot of the coin-carrier, and gearing between said eccentric and said power-driven shaft to actuate said carrier to and fro when not held locked by said locking device, substantially as described.

3. In a coin-controlled meter, a to-and-fro-moving coin-carrier having coin-openings, means to move said coin-carrier to and fro when a coin is present, combined with a plunger, and a coin-feeder to present a coin opposite a coin-opening in said carrier, and means to remove the coin from the feeder into the coin-carrier, the incoming of a coin into a coin-receiving opening of the coin-carrier removing the said locking device, thus releasing the coin-carrier in order that it may be moved, substantially as described.

4. In a coin-controlled meter, a to-and-fro-moving coin-carrier made as a lever having coin-receiving openings and provided with a forked arm, an eccentric or cam to move said coin-carrier to and fro, a coin-feeder to supply said coin-receiving openings in succession with coins, and a discharging device one for each of said coin-receiving openings, substantially as described.

5. In a coin-controlled meter, a to-and-fro-moving coin-carrier made as a lever having coin-receiving openings and a forked arm, an eccentric or cam to move said coin-carrier to and fro, and a locking device to enter either of the coin-receiving openings when a coin is absent and thus restrain the movement of said coin-carrier when a coin is absent, substantially as described.

6. In a coin-controlled meter, a power-driven shaft of a meter, a coin-feeder, a coin-carrier having coin-receiving openings to be supplied with coins, an eccentric or cam to move said carrier to and fro, a registering mechanism containing a plurality of dials, to indicate the quantity of gas consumed, and gearing intermediate said power-driven shaft and said cam and the said registering mechanism to simultaneously actuate said registering mechanism and rotate said eccentric or cam, substantially as described.

7. In a coin-controlled meter, a coin-carrier made as a lever provided with two coin-receiving openings, and with a slot, combined with an eccentric standing in said slot, and means to move said eccentric to actuate said lever to and fro, a coin-feeder to supply coins to said to-and-fro-moving carrier, and discharging devices to push the coins from said coin-carrier at a distance from the point where the coin-feeder in its movement took the said coin, substantially as described.

8. In a coin-controlled meter, a coin-carrier made as a lever provided with two coin-receiving openings, and with a slot, combined with an eccentric standing in said slot, and means to move said eccentric to actuate said lever to and fro, a coin-feeder to supply coins to said to-and-fro-moving carrier, and discharging devices located at that side of the feeder at which the coin was received to act on said coins and push them through the coin-feeder, substantially as described.

9. In a coin-controlled meter, the front and back plates B, A, and a separating-plate provided with openings as 4, 4^0, to leave at one side said plate a coin-receiving chamber f^3, a coin-carrier made as a lever and provided with a plurality of holes, said lever having a slot, an eccentric in said slot, means to actuate said eccentric to move said coin-carrier, and a coin-feeder to supply coins to said carrier, combined with means to detach the coins from said carrier and push them through the openings of said separating-plate and into said receiving-chamber, substantially as described.

10. In a coin-controlled meter, a front and back plate, a separator-plate located between them and provided with a coin-discharging opening and presenting a smooth face at the side of said opening against which may slide one side of the coin while being transferred from a pile into discharging position, a to-and-fro-movable coin-carrier made as a lever and located between said front plate and separator-plate, said coin-carrier having a coin-receiving opening, a plunger to act on a coin and press the same toward the coin-carrier to put said coin in the openings of said carrier when the said openings in the movement of the carrier come opposite the coin to be fed into the carrier, means to positively move the said coin-carrier to and fro in order that the coin may be taken singly from the pile of coins and transferred laterally into position to be discharged through the opening of the separator-plate, substantially as described.

604,176. MILK-PAIL. CHARLES B. MCKINNEY, Mercersburg, Pa. Filed Nov. 8, 1897. Serial No. 657,882. (No model.)

Claim.—1. A combined milk-can and stool consisting of a body having a squared end on which the can is adapted to rest when in an upright position, means for supporting said can in a substantially horizontal position and an upturned mouth formed on the forward end of the can, as and for the purpose described.

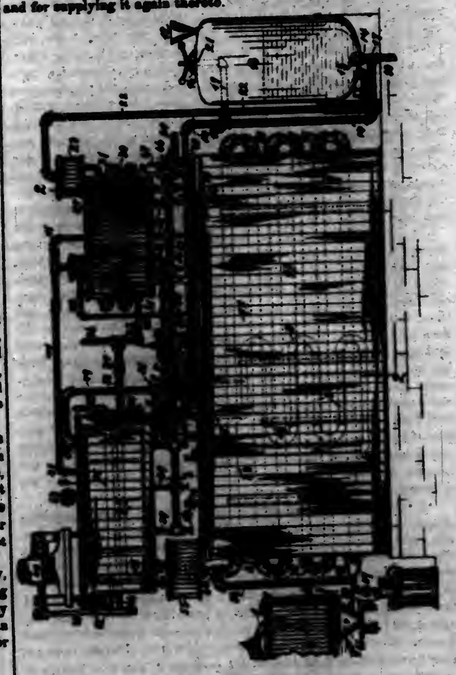
2. In a combined milk-pail and stool, a can consisting of a body having a squared end on which the can is adapted to rest when in an upright position, legs on the side of the can to support it in a substantially horizontal position, an upturned mouth formed on the forward end of the can and a reinforcement forming a seat at the rear portion of the can, as shown and described.

3. A milk-can and stool consisting of a body having a squared end on which the can is adapted to rest when in an upright position, legs on the side of the can to support it in a substantially horizontal position, an upturned mouth formed on the forward end of the can, a reinforcement forming a seat on the rear portion of the can, and handles rigidly and pivotally secured to the forward and rear ends respectively of said body, as and for the purpose described.

4. In a milk-can and stool, a body having a squared end on which said can rests when in an upright position, legs on the side of the can adapted to support the same in a substantially horizontal position, an upturned mouth formed on the forward end of the can, and a seat consisting of a flat portion, and flanges extending downward from the sides thereof, said flanges being secured to the side of the can near the rear end thereof opposite the legs, as and for the purpose set forth.

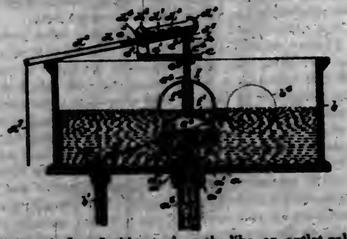
5. A can consisting of a body lying approximately horizontally, legs supporting said body, a seat comprising a reinforcement having downwardly-projecting flanges secured at the rear end of the body to the side thereof making said seat straight across the top, and an upturned mouth formed on the forward end of the body, as and for the purpose described.

604,177. APPARATUS FOR TREATING MILK HYGIENICALLY. WILLIAM F. HEBBLER, Cincinnati, Ohio. Filed June 16, 1897. Serial No. 641,212. (No model.)



Claim.—1. In a plant for treating milk hygienically, by subjecting it to the action of cold air, heat and cooling, the combination of an aerator in which the milk is subjected to the action of cold air, a sterilizer in which it is heated and a cooling-tank in which the air for the aerator is cooled and the temperature of the sterilized milk reduced.

2. In a plant for treating milk hygienically, by subjecting it to the action of cold air, heat and cooling, the combination of an aerator in which the milk is subjected to the action of cold air, a sterilizer in which it is heated, a cooling-tank in which the temperature of the sterilized milk is reduced and a cold-air circuit to supply the air to the aerator, part of said circuit passing through the cooling-tank mentioned for the purpose of cooling the air.



3. In a plant for treating milk hygienically, by subjecting it to the action of cold air, heat and cooling, the combination of an aerator in which it is subjected to the action of cold air, a sterilizer in which the milk is heated, a cooling-tank in which the temperature of the milk is reduced, an air-circuit connecting with the aerator at the bottom and near the top of the same, also with the sterilizer and with the cooling tank, means for putting the air under pressure, and for moving it to and between the devices mentioned, valves in said circuit whereby air may be admitted at the bottom of the aerator for purposes of aerating the milk, valves whereby air under pressure may be admitted on top of the milk while in the aerator to empty the latter, and valves whereby the circuit may be connected with the sterilizer to draw hot air from the latter.

4. In a plant for treating milk substantially as described and containing as parts, a cooling and aerating tank and a sterilizer, the air-conduit for supplying cold air to the cooling and aerating tank and for drawing hot air out of the sterilizer, consisting of coil 3 within which the air is cooled, a cooling-tank within which this coil is contained, a pipe 14 connecting with tank 13 a pipe 40 connecting with the sterilizer, and a pump for moving either cooled air to tank 13, or for drawing hot air out of the sterilizer.

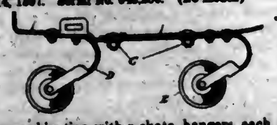
5. A cooling-tank 11 forming part of a plant for treating milk substantially as described, being subdivided by vertical partitions into compartments to contain brine, ammonia-pipe coils for cooling this brine, a pipe-coil 62 within one of the compartments to pass the milk through, a pipe-coil 3 for cooling air, and means for withdrawing the brine independently from the compartment containing the milk-coil and for supplying it again thereto.

604,178. FLUSHING-TANK. HOWARD M. STERLING, Newark, N. J. Filed Feb. 17, 1897. Serial No. 623,234. (No model.)

Claim.—1. In a flushing-tank or the like, an outlet-valve, comprising therein, a hollow vessel forming a float and adapted to rest upon a valve-seat, said float being open to the ingress of the water in the tank when off said valve-seat, and open to a supply of air when upon said valve-seat, and means, for preventing the displacement of said float from the valve-seat when filled with air, consisting, essentially, of a lever pivotally arranged above said flushing-tank, having arm portions $d^{\prime}$ and d^{3}, a trough d^{2} on said arm portion $d^{\prime}$ and a ball movably arranged in said trough for normally exerting a pressure upon the top of said float, and means connected with the arm portion d^{3} of said lever for operating the same and removing said ball from its holding or pressing contact upon said float, substantially as and for the purposes set forth.

2. In a flushing-tank, or the like, an outlet-valve, comprising therein, a hollow vessel forming a float and adapted to fit on a valve-seat, said float being open to the ingress of the water in the tank when off said valve-seat, and a tube connected with the top of said float for admitting a supply of air into said float when upon said valve-seat, and means for preventing the displacement of said hollow float from the valve-seat when filled with air, consisting, essentially, of a lever pivotally arranged above said flushing-tank, having arm portions $d^{\prime}$ and d^{3}, a trough d^{2} in said arm portion $d^{\prime}$ and a ball

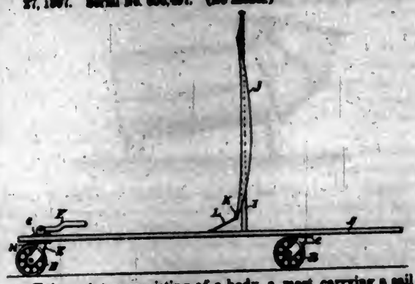
movably arranged in said trough for normally exerting a pressure upon the top of the air-tube on said float, and means connected with said arm portion d^3 of said lever for operating the same and removing said ball from its holding or pressing contact upon said air-tube, substantially as and for the purposes set forth.



3. In a flushing-tank or the like, an outlet-valve, comprising therein, a hollow vessel forming a float and adapted to fit on a valve-seat, said float being open to the ingress of the water in the tank when off said valve-seat, a tube connected with said float for admitting a supply of air into said float when upon said valve-seat, a regulating-valve in said tube, and means for preventing the displacement of said hollow float from the valve-seat when filled with air, consisting, essentially, of a lever pivotally arranged above said flushing-tank, having arm portions d' and d^3, a trough d^3 in said arm portion d' and a ball movably arranged in said trough for normally exerting a pressure upon the top of said air-tube on said float, and means connected with said arm portion d^3 of said lever for operating the same and removing said ball from its holding or pressing contact upon said air-tube, substantially as and for the purposes set forth.

4. In a flushing-tank or the like, an outlet-valve, comprising therein, a hollow vessel forming a float and adapted to fit on a valve-seat, said float being open to the ingress of the water in the tank when off said valve-seat, and open to the supply of air when upon the valve-seat, a stem on said float and an adjustable stop on said stem, a supplemental float to prevent overflow of the water in the flushing-tank, said supplemental float being adapted to engage with said stop on said stem, and cooperating with the hollow vessel forming the other float, to raise it off its valve-seat, and means for normally preventing the displacement of said hollow vessel from its valve-seat, consisting, essentially, of a lever pivotally arranged above said float on said valve-seat, and a weight movable only on that portion of the lever between its pivotal support and its free end directly above said float, for normally exerting a pressure on the float and causing it to rest upon the valve-seat, substantially as and for the purposes set forth.

5. In a flushing-tank or the like, an outlet-valve, comprising therein, a hollow vessel forming a float and adapted to fit on a valve-seat, said float being open to the ingress of the water in the tank when off said valve-seat, and open to the supply of air when upon the valve-seat, a supplemental float to prevent overflow of the water in the flushing-tank, said supplemental float cooperating with the hollow vessel forming the other float, to raise it off its valve-seat, and means, for normally preventing the displacement of said hollow vessel from its valve-seat, consisting, essentially, of a lever pivotally arranged above said flushing-tank, having arm portions d' and d^3, a trough d^3 on said arm portion d' and a ball movably arranged in said trough for normally exerting a pressure upon the top of said float, and means connected with the arm portion d^3 of said lever for operating the same and removing said ball from its holding or pressing contact upon said float, substantially as and for the purposes set forth.

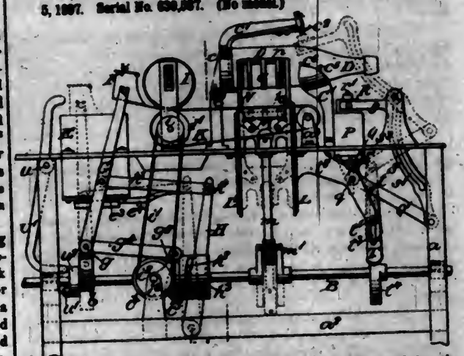


6. In a flushing-tank or the like, an outlet-valve, comprising therein, a hollow vessel e forming a float and adapted to fit on a valve-seat, said float being open to the ingress of the water in the tank when off said valve-seat, a tube e^4 connected with said float e for admitting a supply of air into said float when upon said valve-seat, a stop on said tube, a supplemental float f movably arranged on said tube e^4 to prevent overflow of the water in the flushing-tank, said supplemental float being adapted to engage with said stop, and cooperating with the hollow vessel or float e to raise it off its valve-seat, and means, for normally preventing the displacement of said float e from its valve-seat, consisting, essentially, of a lever pivotally arranged above said float on said valve-seat, and a weight movable only on that portion of the lever between its pivotal support and its free end directly above said float, for normally exerting a pressure on the float and causing it to rest upon the valve-seat, substantially as and for the purposes set forth.

604,179. ROLLER-SKATE. FRANK J. SULER, Philadelphia, Pa. Filed Aug. 14, 1897. Serial No. 648,260. (No model.)

Claim.—In combination with a skate, hangers, each consisting of an elongated strip of metal widened and slotted at one end, the sides of said widened end being turned up parallel with each other, said end being turned down and back at an acute angle to the other portion of the strip, which is secured to the under side of the skate, whereby a spring-action is produced also a drag in the direction of the forward movement of the foot, a roller journaled between said upturned sides, as and for the purpose described.

604,180. TOY. ALFRED M. TOUS, Bordeaux, France. Filed Oct. 27, 1897. Serial No. 656,497. (No model.)



Claim.—A toy consisting of a body, a mast carrying a sail arranged on said body, two wheels journaled at the forward portion of said body, a bracket pivotally secured at the center near the rear portion of the body, a washer secured on the bracket on each side of the body, whereby the friction contact of the washers on said body will hold the bracket in any adjustment, a wheel journaled in said bracket, and a lever for operating the bracket, substantially as shown and described.

604,181. PYROXYLIN COMPOSITION. GUSTAV WALKER, New York, N. Y. Filed Sept. 8, 1896. Serial No. 605,495. (No specimens.)

Claim.—The herein-described composition consisting of pyroxylin and the decreosoted oil of the tar of hard woods having a boiling-point from 65° to 170° centigrade and a specific gravity of about .860 to .910.

604,182. LABELING-MACHINE. THEODORE A. WEBB, New York, N. Y., assignor to Frederick Hasbrouck, same place. Filed June 5, 1897. Serial No. 639,557. (No model.)

Claim.—1. The combination with mechanism for applying the label to the bottle and means for supporting labels in a stack, of a label-carrier comprising a hollow head for receiving a charge of liquid glue, absorbent material secured to the bottom of said head and in communication with the liquid glue through openings in the bottom of the head, valves for controlling the admission of the liquid glue to the absorbent material and means for moving the label-carrier head toward and away from the top of the stack of labels, substantially as set forth.

2. The combination with the label-feeding rollers, one of said rollers being provided with a raised central portion, a label applying mechanism and means for supplying the labels, of a label-carrying head provided on its face with strips of absorbent material spaced apart a distance equal to or greater than the said raised portion on the feed-roller, means for supplying liquid glue to the said strips of absorbent material and means for conveying the label-carrier from the supply of labels to the feed-rollers, substantially as set forth.

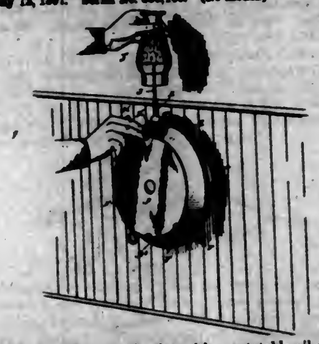
3. The combination with suitable means for feeding and applying the labels, means for holding a supply of labels in the form of a pile or stack and a label carrying head adapted to engage the uppermost label to remove it to the feeding and applying mechanism, of a tappet adapted to push the label-carrying head slightly along the plane of the top of the stack to separate the uppermost label of the stack from the next succeeding label, means for operating the tappet and means for lifting the carrier-head, substantially as set forth.

4. The combination with the seat for receiving the bottle to be

labeled and the skeleton carrier-belt for advancing the label into position to be applied to the bottle, of a label-applying device comprising spring-arms adapted to engage the opposite sides of the bottle, elastic straps connecting the said arms in a transverse direction beneath the bottle and means for moving the said arms through an opening in the skeleton carrier-belt to lift the label from the belt into engagement with the bottle, substantially as set forth.

5. The combination with the skeleton carrier-belt, means for feeding the labels to the belt from the label-receptacle and means for holding the bottle in position to receive the label, of a stop located in position to arrest the movement of the label carried by the belt in a position opposite that portion of the bottle to which it is to be applied and a reciprocating label applying device arranged to remove the label from the belt and apply it to the bottle, substantially as set forth.

6. The combination with a seat for receiving a bottle to be labeled, of means for conveying one label into position spaced from the bottle-seat and a second label into position on the bottle-seat and means for moving the first-named label from its position spaced from the bottle-seat into engagement with the bottle, substantially as set forth.



7. The combination with a seat for receiving a bottle to be labeled and a stack or supply of labels, of an abutment located above the bottle-seat, a label-carrying head provided with a label-discharge plunger and means for conveying the said label-carrying head into a position over the bottle-seat with the discharge-plunger in engagement with the said abutment, substantially as set forth.

604,183. RAILROAD-TIE. HENRY T. ARMSTRONG, Joshua, Tex. Filed May 14, 1897. Serial No. 636,504. (No model.)

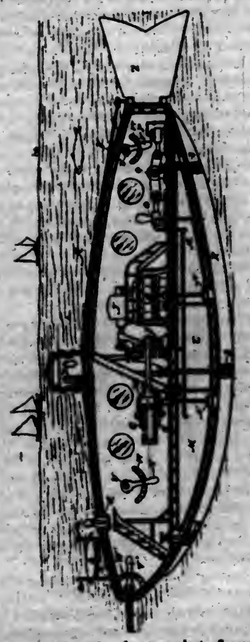
Claim.—The combination with the tie 1, formed with the orifice 9 and the longitudinal groove 7 communicating therewith, and the integral slotted longitudinal web 3, of the block 4 formed with the integral toe 8 and lateral rib 6, and the bolt 5 adapted to detachably secure said block to said web 3, substantially as shown and described.

604,184. OIL-CAN. HENRY C. ATKINSON, Louisville, Ky. Filed May 12, 1897. Serial No. 636,102. (No model.)

Claim.—1. The combination with a rotatable oil-can having a peripheral flange, of the shaft of a chimney-cleaner having a friction-wheel adapted to engage said flange whereby the shaft is rotated by the rotation of the can, substantially as set forth.

2. The combination with a rotatable oil-can provided with a peripheral flange, of the shaft of a chimney-cleaner having a friction-wheel which is adapted to engage said flange, and means for moving said wheel in and out of engagement with the flange of the can, substantially as set forth.

3. The combination with a rotatable oil-can provided with a peripheral flange, of a shaft suitably mounted and having a friction-wheel on one end which is adapted to engage the peripheral flange, and a cleaning device carried by the opposite end of said shaft for engaging and cleaning the chimney, substantially as set forth.



4. The combination with a rotatable oil-can provided with a peripheral flange, of a bracket having an arm carrying a vertical bearing, and a shaft movable in said bearing provided with a cleaning device at its upper end, and a friction-wheel at its lower end adapted to engage the flange of the can, substantially as set forth.

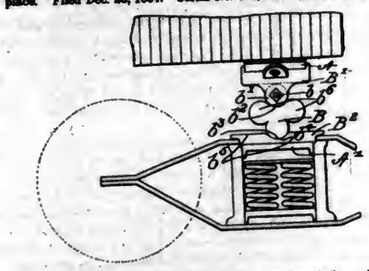
5. The combination with a rotatable oil-can having a peripheral flange, of a bracket having an arm, an arm movable upon said bracket-arm and having a vertical bearing, and a shaft rotatable in said bearing and having a cleaning device at its upper end, and a friction-wheel at its lower end adapted to engage the peripheral flange of the oil-can, substantially as set forth.

6. The combination with a rotatable oil-can formed with a peripheral flange, of a bracket, having an arm, a slotted arm movable upon said bracket-arm and secured in position by a set-screw, said slotted arm having a vertical bearing, and a shaft rotatable in said bearing and provided with a cleaning device at its upper end, and a friction-wheel at its lower end adapted to engage the peripheral flange, substantially as set forth.

7. The combination with an oil-can provided with a peripheral flange and a central bearing, of a bracket, having a horizontally-extending rod at its lower end adapted to engage the bearing of the can, whereby the latter is rotatable, a horizontal arm formed at the upper end of the bracket and supporting a vertical bearing, and a shaft rotatable in said bearing, and provided with a cleaning device at its upper end and a friction-wheel at its lower end which engages the peripheral flange of the oil-can, substantially as set forth.

604,185. SUBMARINE BOAT. GEORGE W. BRAUER, Georgetown, Del. Filed June 12, 1897. Serial No. 641,319. (No model.)

Claim.—1. In a submarine boat, pockets formed in the sides thereof, shafts journaled vertically in the pockets and projecting to the interior of the boat, shanks on the shafts, fins pivoted to the shanks to swing vertically, a crank-shaft journaled in the boat, pitmen extending from the inner ends of the first-named shafts to the crank-shaft, and means for driving the crank-shaft, substantially as described.



2. In combination with a submarine boat, a shaft journaled across the bow of the boat and extending to the exterior, at its ends, a blade secured to the ends of the shaft, a lever secured to the interior portion of the shaft, a segment having holes therethrough and a pin adapted to be passed through a hole in the lever into a hole in the segment, substantially as set forth.

3. In a submarine boat, pockets formed in the sides thereof, shafts journaled vertically therein, shanks secured on the shafts, fin propeller-blades hinged to the shanks to swing vertically, stops on the shanks and lugs on the propellers adapted to come in contact with the stops, as and for the purpose set forth.

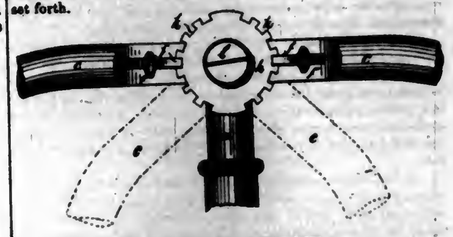
4. Propelling mechanism consisting of vertical shafts, ratchet-wheels on the shafts, pawls to engage the ratchet-wheels, gear-teeth

on the upper face of the ratchet-wheels, shanks on the shafts, propeller-blades journaled thereon, gear-teeth on the propeller-blades meshing with the first-mentioned gear-teeth, substantially as set forth.

604,186. SIDE BEARING FOR RAILWAY-CARS. CHESTER C. BOSTON, Chicago, Ill., assignor of one-half to Edgar C. Dodge, same place. Filed Dec. 23, 1897. Serial No. 663,247. (No model.)

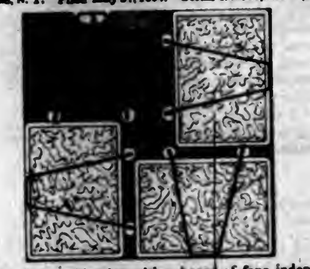
Claim.—1. A side bearing for railway-cars consisting of a strut or brace pivoted to the car or body bolster, a seat or bearing thereon, which is adapted to engage a seat or bearing on said bolster, a seat or bearing on the lower or free end of said strut or brace, which is adapted to engage a seat or bearing on the truck-bolster, supporting-surfaces at both sides of said seat or bearing on the truck-bolster and lateral projections on said strut or brace which are adapted to be brought into contact with said supporting-surfaces, the relation of parts being such as to allow limited depression of the side of the car-body relatively to the truck, substantially as described.

2. A side bearing for railway-cars consisting of a strut or brace pivoted to the car-bolster, a seat or bearing thereon which is adapted to engage a seat or bearing on said car-bolster, a seat or bearing on the lower or free end of said strut or brace, which is adapted to engage a seat or bearing on the truck-bolster, supporting-surfaces at both sides of said seat or bearing on the truck-bolster and lateral projections on said strut or brace, the relation of parts being such that, when the free end of said strut or brace and one of the lateral projections thereon are in contact with one of said supporting-surfaces at the side of the seat or bearing on the truck-bolster, the other of said lateral projections will be in contact with a rigid support on the car-bolster, substantially as described.



3. A side bearing for railway-cars consisting of a strut or brace pivoted to the car-bolster, seats or surfaces thereon which are adapted to engage corresponding seats or surfaces on the car-bolster, the free end of said strut or brace being circular and being adapted to engage a corresponding circular seat formed in the truck-bolster, plane surfaces on each side of said seat or recess in the truck-bolster, lateral projections on said strut or brace which are adapted to be brought into contact with said plane surfaces on the truck-bolster and with the car-bolster by pivotal movement of the truck relatively to the car-body, the relation of parts being such that, when the strut or brace is entirely withdrawn from its seat in the truck-bolster and rests upon the plane surface on said truck-bolster together with one of the lateral projections thereon, the other of said lateral projections will be in contact with a rigid support on the car-bolster, substantially as described.

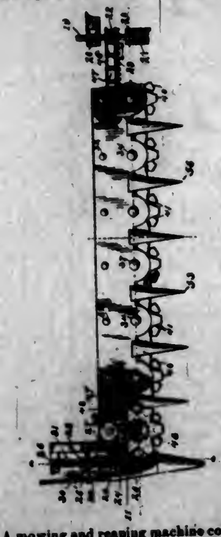
4. A side bearing for railway-cars consisting of a strut or brace pivoted to the car-bolster, circular seats or surfaces on which are adapted to engage corresponding circular seats or surfaces formed on the car and truck bolsters and lateral projections on said strut or brace adapted to be brought into contact with rigid supports on the car and truck bolsters by pivotal movement of said truck, the elements of said bearing-surfaces extending radially relatively to the king bolt which connects the truck to the car-body, substantially as described.



604,187. BICYCLE. WILLIAM H. CASTLE, Woodsport, N. Y., assignor of one-half to the Geneva Cycle Company, Geneva, Ohio. Filed Jan. 27, 1896. Renewed Jan. 20, 1898. Serial No. 667,353. (No model.)

Claim.—1. The combination with the steering-post having a rearwardly-extending arm interiorly threaded and provided with a flange, handle-bars mounted on said arm, adapted to rotate, a notched disk mounted on said arm, means for preventing the disk from rotating upon the arm and means for securing said disk and handle-bars upon said arm and a latch secured upon said handle-bars and adapted to engage with the notches in said disk, as set forth.

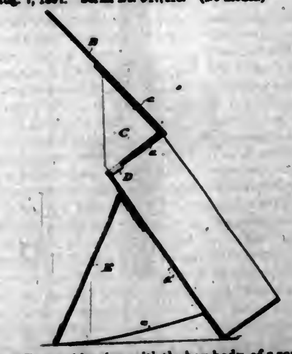
2. The combination with a steering-post, of a rearwardly-extending arm having an interiorly-threaded opening and a flange, handle-bars mounted upon said arm and adapted to rotate, and a notched disk mounted on said arm, means to prevent its rotation, a screw adapted to engage with said opening in the arm for the purpose of holding the disk and handle-bars upon the arm, spring-actuated latches mounted upon said handle-bars and adapted to engage with the notches in the disk, substantially as described for the purposes set forth.



604,188. DUPLICATE-WHIST BOARD. CHARLES H. DAMAN, Syracuse, N. Y. Filed May 27, 1897. Serial No. 638,485. (No model.)

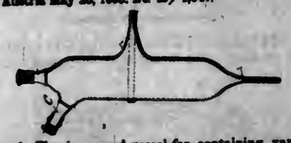
Claim.—The combination with a board of four independent U-shaped card-hand spring-grips, each having its arms secured to said board, and each arm having a pivotal coil projecting above the board substantially the thickness of a hand, whereby each hand is doubly gripped along the entire length of the separated transverse lines of said arms exterior to their pivots.

604,189. ROTARY SICKLE FOR MOWING AND REAPING MACHINES. JOHN A. DAVIS, Desert Lake, Utah, assignor of two-thirds to George Ipson, Huntington, and Harry Wade and Eugene Miller, Castle Gate, Utah. Filed Apr. 29, 1897. Serial No. 634,426. (No model.)



Claim.—1. A mowing and reaping machine comprising the main axle provided with a longitudinal key 4, and collars 7 7, the sleeve 6 formed with the keyway 5, and provided with the oppositely-disposed fixed bevel-gears 12 13, the shaft 14, the bevel gear-wheel 15,

mounted on said shaft and adapted to alternately engage the gear-wheels 12 13, the shaft 19 in operative connection with said shaft 14, and provided with the sprocket-wheel 22, the parallel shaft 25 the sprocket-wheel 24 mounted thereon, and the endless sprocket-chain 23 encompassing said sprocket-wheels, and provided with a series of gear-teeth in combination with the cutting-disks 38 39 arranged one above the other and provided with rectangular hubs 42 and the spur gear-wheels 44 45 having rectangular orifices 46 to receive the hubs of said disks, substantially as shown and described.



2. A mowing and reaping machine comprising a sickle-bar frame provided with a carrying-wheel on its outer end and means substantially as described for imparting a continuous rotary motion to said wheel independent of its contact with the ground, as and for the purpose set forth.

604,190. DISPLAY-BOX. ANTHONY M. HAHN, Philadelphia, Pa. Filed Aug. 7, 1897. Serial No. 647,418. (No model.)

Claim.—The combination, with the box-body, of a support hinged to the bottom thereof; means, substantially as described, for limiting the bending out of said support; a lid hinged to the back of the box and capable of turning upon its hinge into a plane substantially parallel with the plane of the top edges of the box; a hinged stay-piece intermediate between the back of the box and the lid when the latter is in its extreme open position; and a lock upon said stay-piece adapted to form a positive engagement, whereby the lid is prevented from moving in either direction from its extreme open position, substantially as described.

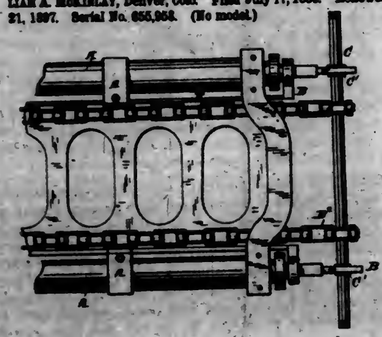
604,191. VESSEL FOR CONTAINING AND ADMINISTERING VOLATILE LIQUIDS. PIERRE P. MONNET, Lyons, France. Filed Aug. 6, 1896. Serial No. 601,977. (No model.) Patented in France Feb. 8, 1895, No. 244,975; in Switzerland Feb. 9, 1896, No. 9,707; in Belgium Feb. 11, 1895, No. 114,078; in England Feb. 14, 1895, No. 3,398; in Germany Feb. 19, 1895, No. 83,657; in Italy Mar. 28, 1895, No. 38,947/102, and in Austria May 25, 1895. No. 45/1,847.

Claim.—1. The improved vessel for containing, vaporizing and administering, volatile liquids under internal pressure, consisting of a vessel-body of such size and form that it may be grasped by and inclosed in the hand, having a plurality of necks projecting from said body in different directions, and having a plurality of capillary outlet-orifices, one in each of said necks, and closing devices for said orifices, whereby either of said orifices can be opened for ejecting the liquid, and said vessel can be refilled when both said orifices are open, substantially as and for the purposes set forth.

2. The improved vessel for containing, vaporizing and administering, volatile liquids under internal pressure, consisting of a vessel having a body of such size and form that it may be grasped by and inclosed in the hand, having a plurality of necks projecting from said body in different directions, having a capillary outlet-orifice in each neck, and having a closing device for each orifice, one of said capillary orifices in one neck differing in diameter from that of the orifice in another neck, whereby either of said orifices can be opened for ejecting the liquid, and said vessel can be refilled when both said orifices are open, substantially as and for the purpose set forth.

3. The improved vessel for containing, vaporizing and administering volatile liquids under internal pressure, consisting of a vessel having a plurality of necks projecting from it in different directions, and having in each neck a capillary aperture, means for closing said orifices hermetically, and cannulæ, substantially as described, for fitting tightly on the necks of said vessel as set forth, said necks having fastenings for said closing means and said cannulæ, and each of the latter having fastenings reciprocal to and fitting those of the necks, whereby either of said orifices can be opened for ejecting the liquid, and said vessel can be refilled when both said orifices are open.

4. The improved vessel for containing, volatilizing and administering volatile liquids under internal pressure, consisting of a thin glass body adapted to be grasped by and inclosed in the hand, whereby the heat of the hand can volatilize the contents of the vessel for generating an internal pressure therein, such vessel having an integral neck having a capillary orifice-opening at its outer end, an external metal collar fixed on and surrounding said neck, and a cap closing said orifice, embracing the end of said neck, and held thereon by said collar.



5. The improved vessel for containing, volatilizing and administering volatile liquids under internal pressure, consisting of an elongated body for containing the liquid, adapted to be grasped by and inclosed in the hand, whereby the heat of the hand may volatilize the liquid to generate an internal pressure, said body having an elongated neck exteeding from it angularly of its longitudinal axis, a capillary orifice traversing and opening at the end of said neck, a cap enveloping the end of said neck and closing said orifice, and fastening provisions on the exterior of said neck engaging said cap for holding it thereon, whereby said orifice can be opened and closed by removing and applying said cap, and the liquid can be discharged through said neck when said body is inclined toward the horizontal.

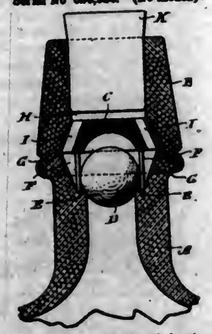
6. The improved vessel for containing, volatilizing and administering volatile liquids under internal pressure, consisting of a glass body adapted to be held in the hand, whereby the heat of the hand can volatilize the liquid and generate an internal pressure in the vessel, having two integral necks, having capillary orifices traversing and opening at the end of each neck, an outer metal collar surrounding and fixed to each neck, and a cap for each neck closing the orifice therethrough, inclosing the end of the neck and engaging the collar thereon.

7. In vessels for containing, volatilizing and administering volatile liquids, a vessel-body for containing the liquid, adapted to be grasped by and inclosed in the hand, whereby the heat of the hand can volatilize the liquid to generate an internal pressure, said body having two independent outwardly-projecting necks, the one angular in its projection relatively to the other, capillary orifices traversing and opening through said necks respectively, fastenings on the exteriors of said necks, and caps for closing said orifices enveloping the ends of said necks respectively and held thereon by said fastenings, whereby the liquid can be discharged in different directions relatively to the longitudinal axis of said body.

8. The improved vessel for containing, volatilizing and administering volatile liquids under internal pressure, consisting of a vessel-body of suitable size and form to be grasped by and inclosed in the hand, whereby the heat of the hand can be used to volatilize the liquid for generating an internal pressure in the vessel, having two necks, the one axial and the other angular in extension relatively to the longitudinal axis of the body, a capillary orifice traversing and opening through each of said necks, fastenings on the exteriors of said necks respectively, and caps for closing said orifices, and enveloping the ends of said necks respectively, and held thereon by said fastenings.

604,192. MINING-MACHINE. EDWARD S. MCKINLAY and WILLIAM A. MCKINLAY, Denver, Colo. Filed July 17, 1896. Renewed Oct. 21, 1897. Serial No. 655,956. (No model.)

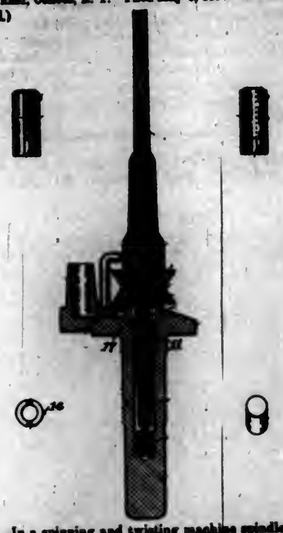
Claim.—1. In a mining-machine, the combination with a bed or supporting-frame adapted to be made stationary, the carriage or frame to which the cutting apparatus is attached and which is movable upon the said bed to vary the position of the cutting apparatus, of the cutter-carrying shaft, the two bearings on the carriage for the ends of the shaft, the series of hubs or holders for the teeth, all of substantially the same diameter, and arranged, some between, and some outside of, the said two bearings and adapted to slide longitudinally along the shaft and the cutters secured to the said hubs and projecting therefrom, substantially as set forth whereby a cut can be produced of uniform diameter from end to end, and the shaft can be removed in either direction relatively to the cutter-hubs while they are in position, substantially as described.



2. In a mining-machine, the combination of the bed or frame adapted to be made stationary, the carriage or movable frame mounted thereon and adapted to carry the cutting apparatus, the shaft or bar secured to said carriage, for carrying the cutters, the bearings for said shaft, one at or near each end thereof, the cutter-carrying hubs situated between the said bearings and movable on the shaft longitudinally, the similar hubs at the ends of the shaft outside of the bearings, and means substantially as described for locking the hubs of the whole series against longitudinal movement along the shaft, substantially as described.

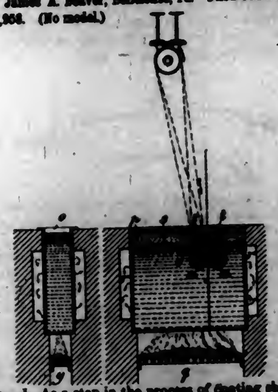
3. In a mining-machine, the combination of the bed or frame adapted to be made stationary, the sliding frame or carriage thereon, the cutting apparatus, the shaft which is non-circular in section mounted on the carriage, two bearings on the carriage for said shaft respectively at or near the ends thereof the bearing-pieces for the shaft having apertures of a cross-section corresponding to that of the shaft, the removable washers adapted to move longitudinally along the shaft, and the cutters secured thereto, said shaft being removable from the cutters which are between the bearings while the cutters remain in position substantially as described.

4. In a mining-machine, the combination of the bed or frame adapted to be made stationary, the movable carriage, the bar or shaft mounted in two bearings on the said carriage, the open hubs or washers on the said shaft adapted to move longitudinally thereon, the cutters projecting from the said washers, and the cutters on the hubs adjacent to the said bearing being arranged to project laterally to overlap the bearings and cut a path therefor, said shaft being longitudinally movable in either direction through the said hubs while they are in position substantially as described.



5. In a mining-machine, the combination of a stationary bed, as at A A, the sliding carriage, as at B, B, the shoes B' B' supported on the carriage, the cutter-bar C, supported in said shoes, one of the latter being on one side of the center, longitudinally of said bar and the other on the other side of said center, the series of cutter-carrying hubs or washers D between the said shoes and movable longitudinally along the shaft or bar C, the series of similar hubs or washers outside of each of said shoes and on said bar C, and means substantially as described for rotating said bar and with it the said hubs or washers, as set forth.

604,193. BOTTLE. JOHN C. PATTERSON, Philadelphia, Pa. Filed Mar. 11, 1897. Serial No. 626,986. (No model.)



Claim.—The combination with a bottle having a valve-seat formed in its neck, a chamber of inverted cone shape above said valve-seat, integral inwardly-projecting lugs F upon the sides of said chamber, and a valve adapted to said seat; of a ferrule B having its lower end fitted to the upper end of the bottle-neck, a substantially cylindrical bore in its upper end adapted to receive a cork, a chamber of larger diameter than said bore at its lower end; and a stop C in said latter chamber, said stop having a solid body resting upon the lugs F and as large in diameter as the bore for the cork and being provided with projecting lugs I which conform to the wall of said enlarged chamber, whereby irregular passages are formed around the stop and direct access to the valve is prevented, substantially as described.

604,194. SPINNING AND TWISTING MACHINE SPINDLE. JOHN B. PEREZ, Osborn, N. Y. Filed May 6, 1897. Serial No. 636,396 (No model.)

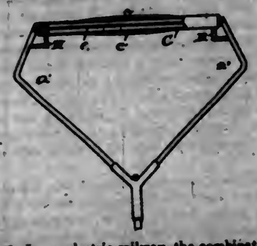
Claim.—In a spinning and twisting machine spindle, the combination with a sleeve-whirl spindle having a pointed foot, a holder therefor adapted to be secured to the bolster-rail, and a tube extending from the holder into the sleeve-whirl of larger internal diameter than the internal diameter of the lower part of the holder, of a flat step in the lower part of the holder forming the vertical support of the spindle, a short cylindrical bolster loose in the tube extending upward from the holder into the sleeve-whirl and held against rotation by a pin, whereby the spindle is supported laterally within the sleeve-whirl by a short bolster free to adjust itself with the spindle, as described.

604,195. PROCESS OF AND APPARATUS FOR MANUFACTURING TIN-PLATE. WILLIAM ROGERS, Lanchburg, Pa., assignor of one-half to James A. Beaver, Bellefonte, Pa. Filed Oct. 24, 1896. Serial No. 609,906. (No model.)

Claim.—1. As a step in the process of coating sheets of iron or steel with tin or other coating metal or alloy, preparing the sheets by subjecting them, after rolling and without previous pickling for removing the scale, to heat in a suitable furnace while inclosed in a pack in a suitable vessel or box, and protected from the access of atmospheric air by surrounding them with pulverized sand, lime, iron ores, or other suitable material, whereby is effected a mutual reaction between the external oxid scale and the internal carbon of the sheets; substantially as and for the purpose described.

2. In the process of preparing sheet-iron for coating with tin or other metal or alloy, deoxidizing and decarburizing the sheets without removal of the iron scale, by inclosing them in a pack within a suitable receptacle, and preventing the access of atmospheric air by surrounding them with sand or pulverized material, such as dolomite or iron ore, placed within the receptacle, the sheets being protected from actual contact with such pulverized material by an envelop or inclosure composed preferably of sheet-iron, and subjecting the sheets thus surrounded to heat in a suitable furnace and thereby effecting a mutual reaction between the external oxid (scale), and the internal carbon, of the sheets, substantially as described.

3. The process of reducing the oxid and largely eliminating the carbon from sheets of rolled wrought-iron, at one operation, by subjecting them, without previous removal of the oxid coating, to furnace heat, when inclosed in a substantially air-tight receptacle, and protected from access of external air, effecting thereby a mutual reaction between the oxid of the external scale and the internal carbon, of the sheets, substantially as described.

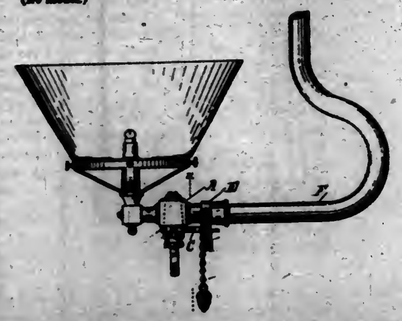


4. As a finishing step in the process of manufacturing tin-plate, or other metal-coated sheets, subjecting the sheets to the compressive and polishing action of burnished steel rolls coated wholly or partially with grease, said sheets having been first treated, without removal of the surface oxid to a simultaneous deoxidizing and decarburizing operation of heating in a substantially air-tight receptacle, and then coated by dipping in molten metal substantially as described.

5. The process of making tin-plate or other metal-coated sheet-iron, by subjecting the metal sheets to a process of simultaneous deoxidation and decarburization, by exposure to heat in a suitable vessel protected from access of external atmosphere for the purpose of effecting a mutual reaction between the external oxid (scale) and the internal carbon, of the sheets, then coating the wrought-iron sheets by dipping in tin, or other coating metal in a molten condition, and finally subjecting the sheets to the compressive action of polished steel rolls, to compact the pores of the metal sheet, and effect a firmer adherence of the coating metal, substantially as described.

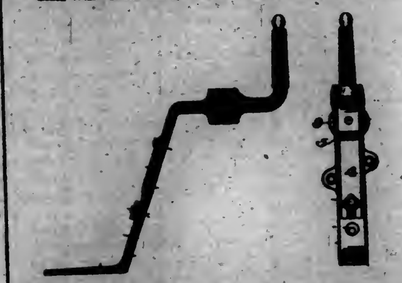
6. The process of coating sheet-iron with tin or other metal or alloy, consisting in the following steps, viz: deoxidizing, decarburizing and softening the sheets in the manner hereinbefore described without previous removal of the surface oxid, by subjecting them to heat in a furnace when inclosed in a substantially air-tight receptacle, protected from access of external atmosphere, then coating such sheets with melted grease, then dipping the sheets repeatedly in a tank of melted coating metal, then dipping each sheet separately in a tank of melted metal at a lower temperature, and finally subjecting sheets so prepared and coated to rolling pressure while immersed in melted grease; substantially as described.

7. The apparatus hereinbefore described for finishing sheets of wrought-iron after immersion in molten coating metal consisting of a tank for holding grease, or grease and molten coating metal, means for heating said tank, cooling-pipes horizontally traversing said tank to prevent the overheating of the grease, said tank being furnished with one or more pairs of rolls, one pair at least arranged to be in contact with or immersed in grease, and adapted to exert a compacting and polishing pressure on both surfaces of each coated sheet, passing through between them, and for feeding and delivering the metal-coated sheets, substantially as described.



604,196. TROLLEY FOR ELECTRIC RAILWAYS. SIDNEY H. SHORT, Cleveland, Ohio. Filed Sept. 20, 1895. Serial No. 607,111. (No model.)

Claim.—1. In an electric railway, the combination of a motor-car, and an overhead conductor, with a trolley-arm mounted on the car by means which permit the vertical movement but prevent the lateral movement of the upper end of the trolley-arm, a horizontal cylindrical roller mounted on the upper end of said trolley-arm, and a convex sleeve centered upon said roller between its ends, substantially as and for the purpose specified.

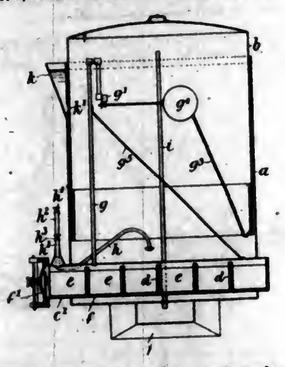


2. In an electric railway, an overhead conductor, and a trolley-arm mounted upon a car, combined with a horizontal cylindrical roller mounted upon the upper end of the trolley-arm, a sleeve secured upon said roller between its ends, a rod extending through the roller and the ends of the arm, and ball-bearings placed upon the rod, and fitting in the ends of the roller, substantially as described.

604,197. SAFETY ATTACHMENT FOR GAS-COCKS. JAMES F. SMITH, San Francisco, Cal. Filed Dec. 15, 1897. Serial No. 661,948. (No model.)

Claim.—In combination with a gas-cock having a turnable key, the stem of which is provided with a stop-pin adapted to contact with a fixed flange on the cock, a safety attachment therefor, consisting of a yoke, independent of the key-stem and fitted freely thereto to normally lie with the extremities of its arms in the path of movement of the stop-pin, and adapted to confine said pin between them and the ends of the fixed flange, whereby the key is normally locked, a holder or clamp supported by the fixture, and having a hanger on which the yoke is slidingly fitted, a suitable pull attachment to the yoke for moving it in a plane to free the stop-pin of its extremities, and enable said pin to ride upon its adjacent surface in turning, as the key is turned to open the cock, whereby the cock may remain open, and a spring on the hanger, bearing on the yoke, to automatically return it to its normal position as the pin passes from its surface, as the key is turned to close the cock.

604,198. ADJUSTABLE VEHICLE-IRON. HENRY C. SWAN, Oshkosh, Wis. Filed Jan. 6, 1898. Serial No. 665,742. (No model.)



Claim.—1. A vehicle-iron composed of two parts, one part having a longitudinal recess with an elongated slot in its bottom, and an end loop, and the other part being arranged to lie within the longitudinal recess in the same line with the first part and under the loop, and having a bolt movable along within the elongated slot.

2. A vehicle-iron composed of two parts, one part having a recess with an elongated slot in its bottom, and the other part being arranged to lie within the recess and having a slotted end to receive a bolt movable along and within the slot in the other portion.

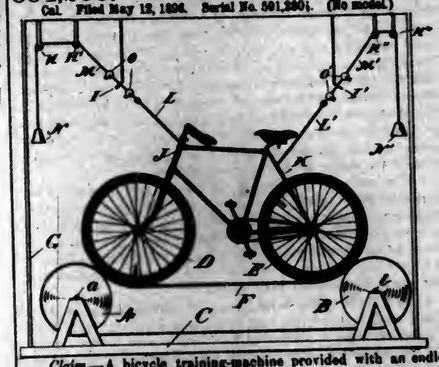
3. A vehicle-iron comprising a base portion arranged to be secured to the vehicle, said portion having an open-ended recess with a loop or bar crossing its end, the base of the recess being provided with an elongated slot, and another portion having a depending arm arranged to pass under the loop and rest within the recess, the lower end of the arm being slotted to receive a bolt which passes through the slot in the base portion.

4. A vehicle-iron composed of two parts, one part having an elongated slot, and the other part lying longitudinally of the first part in the same line, and having a slotted end to receive a bolt movable along and within the elongated slot.

604,199. APPARATUS FOR GENERATING ACETYLENE GAS. FREDERICK S. TROBE and CHARLES HUDDLE, London, England. Filed Nov. 21, 1896. Serial No. 612,963. (No model.) Patented in England July 18, 1896, No. 15,963; in France Mar. 22, 1897, No. 265,252; in Belgium June 2, 1897, No 128,632, and in Canada Dec. 1, 1897, No. 58,234.

Claim.—1. In apparatus for generating storing and cooling acetylene gas, the combination with a gasometer or gas-holder, and with the gas-generator having a tray for carbids within the same, such generator being located in the bottom of the gasometer and surrounded by the water in the same, of two pipes in connection with the carbid holder or generator, one of these pipes being in communication with the gasometer below the surface of the water, and the other with the gasometer above such surface, and of means whereby the latter is closed or opened by the movement of the gasometer, substantially as described.

2. In apparatus for generating and storing acetylene gas, the combination with a gasometer or holder, and with one or more generators having carbid-containers, and located in the bottom of the gasometer, of two passages or pipes within such gasometer or holder and in connection with each generator, one of which pipes places each generator in communication with the gasometer below the surface of the water therein, and the other being also in communication with the gasometer above the surface of the water therein, of a ball-cock within the gasometer fitted to the latter pipe and controlled by the rise and fall of the gasometer cylinder, and whereby the flow of gas is controlled by one inlet, and the gas may enter by the water-inlet and into the gasometer, and pressure in the generator is avoided.



3. In apparatus for generating and storing acetylene gas, the combination with a gasometer or holder and with one or more generators located therein, of two pipes or passages within the gasometer and in connection with each generator, one of which pipes places each generator in communication with the gasometer below the surface of the water, and the other with the gasometer above the surface of the water, of a ball-cock within the gasometer and fitted to the latter pipe, and of a chain connecting the ball-cock float with the lower part of the sliding cylinder of the gasometer and whereby when the said cylinder descends the chain opens said cock, the other pipe or passage always permitting a free inflow of gas to the gasometer, all substantially as set forth.

4. In apparatus for generating, storing and cooling acetylene gas, the combination with a gas-holder or gasometer, of gas-generating chambers provided with sliding trays serving as the carbid-containers and located within the gasometer, and two pipes within such holder, one of which makes communication with the holder below the surface of the water, and the other of which is in such communication above its surface.

5. The described carbid containers or trays divided into a series of compartments by partitions *d*, each partition having a notch or opening at its upper end as described, in combination with perforated or gauze funnels or tubes d^3, as and for the purposes set forth.

6. In apparatus for generating and storing acetylene gas, the combination with a gasometer, of two or more hermetically-closed generators in the bottom of the gasometer and preferably surrounded by water, a carbid-container in the form of a tray within each of such generators and having a series of communicating compartments whereby the water passes from one compartment to another, the tray being adapted to be slid horizontally within its generator and to have the carbid in each compartment, means for admitting water to the carbid-container, a gas-outlet, a cooling-chamber beneath the gasometer-tank, and a gas-pipe leading from the upper part of the gasometer and through the water therein to this chamber, and a gas-outlet pipe from such chamber, all substantially as set forth.

604,200. BICYCLE-TRAINER. HENRY VOGELER, San Francisco, Cal. Filed May 12, 1896. Serial No. 591,290. (No model.)

Claim.—A bicycle training-machine provided with an endless belt F for supporting the wheels of the bicycle, guides L L' reaching upward from said bicycle and yieldingly secured to an overhead support, and stops O O' adapted to limit the play of said guides substantially as set forth.

604,201. PLATING METALS. WILLIAM J. WILDER, St. Louis, Mo. Filed Oct. 26, 1897. Serial No. 656,697. (Specimens.)

Claim.—1. As a new manufacture iron or steel having a coating of a flexible tenacious alloy, containing aluminium, tin and zinc.

2. As a new manufacture iron or steel having a coating of an alloy containing aluminium, lead, tin and zinc, substantially as described.

3. The process of preparing the herein-described new manufacture consisting in preparing a molten bath of an alloy containing aluminium, tin and zinc; cleansing iron or steel and applying a suitable flux and after applying the flux introducing the iron or steel into, and withdrawing it from, the bath, substantially as described.

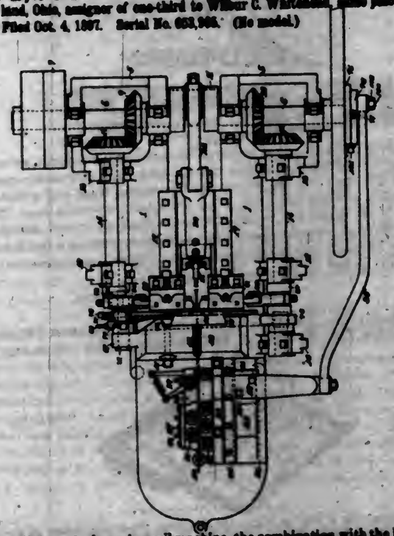
4. The process of preparing the herein-described manufacture, consisting in preparing a molten bath of an alloy containing aluminium, lead, tin and zinc, cleansing iron or steel and applying a suitable flux; and after applying the flux, introducing said iron or steel into and withdrawing it from the bath, substantially as described.

604,202. OIL-WELL PUMP. WILLIAM J. WRIGHT, Pittsburg, Pa. Filed June 11, 1897. Serial No. 640,374. (No model.)

Claim.—1. An improved oil-well pump, comprising a standing valved feed-tube, a working barrel operating over such tube, having an upwardly-opening valve and a lift-tube, and an outer tube-section having anchoring means, said tube being connected with the standing feed-tube and forming the lower support therefor, and having a guide-support at the upper end on the lift-tube, all being arranged substantially as shown and for the purposes described.

2. An oil-well pump comprising an outer tube, an anchor-tube connected to the lower end thereof, said outer tube having discharge-openings near the lower end, a standing feed-tube secured at the lower end to the outer tube and having its upper end provided with an outwardly-opening valve and extended up into the outer tube, packing-cups secured to the said upper end, a working barrel having a guide on the standing tube and provided at its upper end with a valved outlet and a lift-tube connected to such outlet as specified.

3. An oil-well pump, comprising a standing feed-tube having a suitable upwardly-opening valve, a working barrel operating over such feed-tube, having a tubular lift-tube, and an outer tube incasing the working barrel and standing feed-tube, having a feed-opening at the lower end communicating with the feed-tube, and an aperture at the top for the passage of the lift-tube, and provided with discharge-openings, and means for securing it to the sides of the well, as set forth.



4. An oil-well pump, comprising an outer tube, a cage secured to the lower end thereof having wedge-dogs, the anchor-tube projected into the cage and having a head portion to engage and force such dogs outward, a standing feed-tube secured to the outer tube having an outwardly-opening valve at the upper end and a packing surrounding such end, a working barrel, having a lift member 11 at the lower end; a valved discharge at the upper end and a lift-tube connected to such discharge end as specified.

5. As an improvement in oil-well pumps, the combination with the outer tube having a closed lower end and a detachable centrally-apertured cap 20, at the top, a standing feed-tube extended through the bottom of the outer tube, having packing-cups, and a valve above the cups, a working barrel, a closed cage 12, detachably connected to such barrel, a valve, said cage having an upwardly-opening valve, a lift-tube connected to the said cage, and anchor means secured to the outer tubing, all being arranged substantially as shown and described.

6. The combination with the outer tube having a removable bushing 4, a cage having wedge members, an anchor-tube loosely connected to the cage having a member adapted to engage and set the wedge members, said outer tube having a cap at the upper end, a standing feed-tube connected at the lower end to the bushing 4, and provided with a valve at the upper end and packing at a point below the valve, a working barrel having a valved outlet at the upper end, and the lift-tube guided in the cap of the outer tube, all being arranged substantially as shown and for the purposes described.

604,203. WIRE-NAIL MACHINE. GEORGE W. ARDELL, Cleveland, Ohio, assignor of one-third to Wilbur C. Whitehead, same place. Filed Oct. 4, 1897. Serial No. 653,966. (No model.)

Claim.—1. In a wire-nail machine, the combination with the bed, of a reciprocating feed-plate arranged thereon, a device for vertically adjusting the feed, consisting of an upright 38 provided with a threaded portion 39, adapted to engage in a threaded recess formed in the plate, a shoulder 43, and cylindrical portion 40, means for clamping the upright within the plate, after the required adjustment of the former has been made, a chisel-carrier swiveled upon the upright, comprising the chisel-plate 46 and outwardly-extending arm 49, a chisel fixedly secured within the chisel-plate, and a spring connection between the arm 49 and an arm 51 integral with the feed-plate.

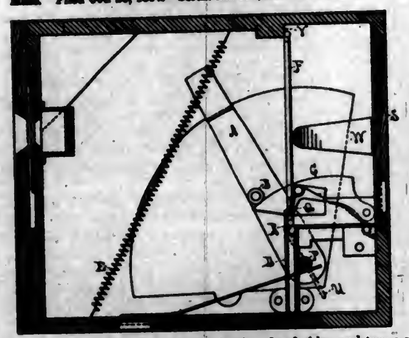
2. In a wire-nail machine, the combination with the bed, of a main driving-shaft mounted thereon and a side shaft driven thereby, a wire-clamping device comprising a horizontally-arranged stationary die, and a similarly-arranged movable or operating die, said operating-die being mounted for lateral movement, a transverse lever fulcrumed at one side of the bed, extending across the latter to the opposite side in proximity to the driven side shaft, and adapted to be operated by said shaft, a connecting device intermediate the supported end of the lever and the movable die, whereby, upon the actuation of the lever, an inner lateral pressure will be exerted by the latter upon said die, and means for returning the lever to its initial position after its actuation.

3. In a wire-nail machine, the combination with the machine-bed and a main driving-shaft mounted thereon, of a driven side shaft, a wire-clamping device, a transverse U-shaped lever arranged across the machine-bed and embracing the sides thereof, said lever having one of its embracing-arms fulcrumed upon one side of the bed, and the other arm extending in proximity to the side shaft upon the opposite side of said bed, and adapted to be operated by the driven shaft, an extension projecting upwardly from the supported end of the lever above the level of the bed, a connecting device intermediate the extension and the clamping device, whereby, upon the actuation of the lever, a lateral pressure will be exerted by the latter upon the clamping mechanism, and means for returning said lever to its initial position after its actuation.

4. In a wire-nail machine, the combination with the machine-bed, of a main driving-shaft mounted thereon, a side shaft driven thereby, a wire-clamping device comprising a horizontally-arranged stationary die, and a similarly-arranged movable or operating die, said operating-die being mounted for lateral movement, a transverse U-shaped lever arranged across the machine-bed and embracing the sides thereof, said lever having one of its embracing-arms fulcrumed upon one side of the bed, and the other embracing-arm extending in proximity to the shaft upon the opposite side of said bed, and adapted to be operated by the shaft, an extension projecting upwardly from the supported end of the lever above the level of the bed, a connecting device intermediate the free end of the extension and the operating-die, whereby, upon the actuation of the lever, an inward lateral pressure will be exerted upon the die by the extension, and means for returning the lever to its initial position after its actuation.

5. In a wire-nail machine, the combination with the machine-bed, of a bracket projecting from the side of the bed above the level thereof, said bracket having an inclined face toward the bed and a bearing in said inclined face below the top of the bracket, and a cap for said bearing, the parts being so arranged and constructed that the side thrusts will be received by the bracket-body and transmitted therethrough to the frame or bed itself.

6. In a wire-nail machine, the combination with the main driving-shaft, of a driven shaft operated thereby, a lever 66 having upwardly-projecting end portions 67 and 68, and an extension 77, a pin 71 upon which one end of the lever is pivotally supported, a roller-bearing in the free end of the lever, a clamping die, connections between the extension 77 and said die, a cam secured to the driven shaft adapted to bear against the roller-bearing in the free end of the lever, the spring 74, and the adjustable stop 76, substantially as described and shown.



7. In a wire-nail machine, the combination with the machine-bed and a main driving-shaft mounted transversely thereon, of a plurality of bracket-arms arranged upon each side of the bed and extending upwardly therefrom, each arm being provided with an inner inclined face and having a recess formed within said face, shaping the free end of the arm thereby into a substantially vertical portion with respect to the bed, a journal-box arranged within each recess, each box constructed to abut against the vertical portion of the arm, whereby a solid backing is formed for the side shafts adapted to receive and sustain the lateral thrusts imposed upon said shafts, and the side shafts arranged one upon each side of the machine within the journal-boxes, and adapted to be driven by the main shaft.

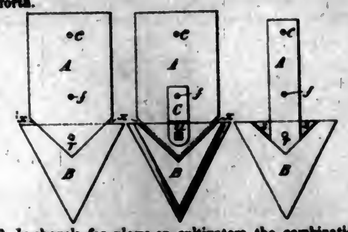
8. In a wire-nail machine, the combination with a machine-bed and a main driving-shaft mounted transversely thereon, of a plurality of bracket-arms arranged upon each side of the bed and extending upwardly therefrom, each arm being provided with an inner inclined face and having a recess formed within said face shaping the free end of the arm into a vertical portion with respect to the bed, a journal-box arranged within each recess, each box having constructed

thereon a vertical face adapted to abut against the vertical portion of the bracket-arm, whereby a solid backing is formed for the side shafts adapted to receive and sustain the lateral thrusts imposed upon the shafts, and the said side shafts arranged one upon each side of the machine within the journal-boxes and adapted to be driven by the main driving-shaft.

9. In a wire-nail machine, the combination with the machine bed and a main driving-shaft mounted transversely thereon, of a plurality of bracket arms arranged upon each side of the bed and extending upwardly therefrom, each arm being provided with an inner inclined face and having a recess, substantially a right angle in configuration, formed within said face, shaping the free end of the arm, with respect to the bed, into a vertical portion having an inner vertical face, a divided journal-box mounted within the recess, the lower member of said box conforming in configuration to said recess, whereby a solid backing is formed by the bracket-arm for the shafts, and the said shafts arranged one upon each side of the machine within the journal-boxes and adapted to be driven by the main driving-shaft, substantially as described.

604,204. MAGAZINE-CAMERA. JACOB J. CRANE, Newburyport, Mass. Filed Oct. 20, 1897. Serial No. 656,736. (No model.)

Claim.—1. A magazine-camera having fixed sides and top, a removable door in back and bottom, two parallel arms A, located on each side of the interior of the camera, said parallel arms being attached to the rod P which extends across the lower corner of the camera and to which is attached a thumb-piece which is adapted to be operated on the outside; two rollers B, attached to the inside of said parallel arms, said rollers running over the semicircular edges of the two levers C; said levers being loosely attached to the frame which also serves as a plate-holder guide; these levers on being pressed downward force the plate-holders down so that the extended tops of the plate-holders are released from the projecting ledge V, below the tops of said parallel arms, for the purpose and in the manner described.



2. In a magazine-camera the combination of the two parallel arms A, the rod P, which extends through the lower corner of the box and adapted to be operated by an outside thumb-piece, the two rollers B, which are attached to each of the parallel arms, the two levers C, having semicircular edges, substantially for the purpose described.

3. In a magazine-camera the combination of the two parallel arms A, the rod P, which extends through the lower corner of the camera-box and adapted to be operated by an outside thumb-piece U, the two rollers B, which are attached to each of the parallel arms, the two levers C, having semicircular edges and the two pawls Q, which are attached to said levers, substantially for the purpose described.

4. In a magazine-camera having fixed sides and top and removable doors in the back and bottom, the combination of two parallel arms A, which are attached to and turn with a rod P, which extends across the lower corner of the camera-box; said rod adapted to be turned by an exterior thumb-piece U; two rollers B, attached to said parallel arms, said rollers being adapted to run over the semicircular edges of the two levers C; two pawls Q, attached to said levers, the two spring-clips R, and the spiral springs E, which are diagonally attached to the top and bottom of the camera inside, for the purpose specified.

604,205. CULTIVATOR-SHOVEL. GEORGE T. CROSARDER, Newton, Kans. Filed Jan. 20, 1898. Serial No. 667,227. (No model.)

Claim.—1. In shovels for plows or cultivators, the shovel constructed of standard and point, with the standard extending downward into the wedge-shaped socket *s s* formed in the upper and front central region of the point and secured by the bolt *r* and the nut *u* as set forth.

2. In shovels for plows or cultivators, the combination of the standards A and the points B, the standards secured against the floor and between the side walls of the socket *s s*, the point extending at its upper edge laterally on both sides, beyond the standard, and the narrow-size standard reinforced by rear extension C as substantially described and for the purposes set forth.

604,206. MODIFICATION OF CELLULOSE AND METHOD OF PREPARING SAME. CHARLES F. CROSS, EDWARD J. BEVAN, and CLAYTON BEADLE, London, England. Filed Aug. 16, 1898. Serial No. 688,979. (No specimens.)

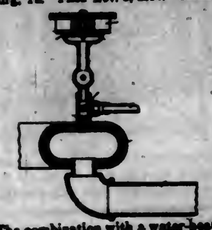
Claim.—1. The structureless insoluble modification of cellulose recovered through the decomposition of the soluble plastic compound hereinbefore described.

2. The process herein described consisting in first treating cellulose to form the soluble plastic compound described hereinbefore, and then decomposing the plastic compound thus obtained, substantially as set forth.

3. The process herein described consisting in first treating cellulose with caustic alkali and carbon disulfid, and then decomposing the plastic compound thus obtained, substantially as set forth.

4. A structureless insoluble modified cellulose obtained by first treating cellulose, with caustic alkali and carbon disulfid, and then decomposing the soluble mass thus obtained to obtain the modified cellulose.

604,207. COTTON AND CORN SCRAPER. THOMAS F. DOVE, Cotton Gin, Tex., assignor of one-third to W. R. Reland, same place. Filed Nov. 20, 1897. Serial No. 659,256. (No model.)

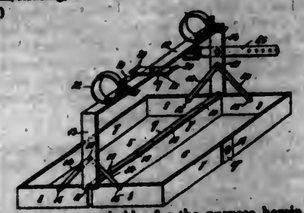


Claim.—An improved article of manufacture, a scraper or sweep for plows constructed of a strip of metal bent between its ends upon an oblique line and at an obtuse angle, forming a shank and a blade, the latter inclining upwardly, rearwardly and outwardly from the plane of the shank and having a partial twist given thereto, and the shank having a centrally-disposed longitudinal slot curving in the direction of its length and having the front end of the shank beveled, substantially as and for the purpose described.

604,208. POCKET CIGARETTE-MACHINE. THADDEUS S. FITCH, Oakland, Cal. Filed Sept. 22, 1897. Serial No. 652,803. (No model.)

Claim.—In a pocket cigarette-machine, the combination of the bed having upwardly-curved sides, a loose apron attached at one end to the side of the bed, the spring-guides having curved slots 1 2 at the ends and a connecting straight slot, fixed rails on the bed beneath and in the same plane with the guides, a roller adapted to travel along and to rotate in said guides and provided with circumferential grooves for the guides and a head on the end for rotating it, the end of the apron being attached to said roller.

604,209. GAS-BURNER FOR WATER-HEATERS. HENRY F. GAMBS, Pittsburg, Pa. Filed Nov. 3, 1897. Serial No. 657,267. (No model.)



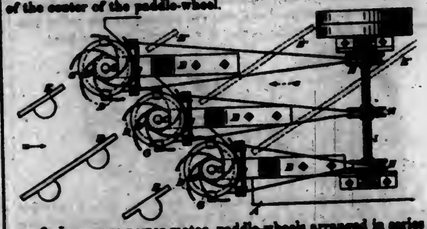
Claim.—1. The combination with a water-heater having a heating-burner, of a valved gas-supply leading thereto, a pilot-light burner having a branch supply-pipe extending therefrom to the main gas-supply at a point beyond the valve therein, and another connection leading from the pilot-light burner to the main gas-supply between the valve therein and the heating-burner and provided with an automatic valve which prevents backflow from the pilot-light burner to the heating-burner when the gas-supply to the heating-burner is cut off.

2. The combination with a water-heater having a series of heating-burners connected to a common supply-chamber extending beneath them, of a pilot-light burner also connected to the common supply-chamber and having a downwardly-closing gravity-valve in the connection, said valve being arranged to be lifted by the pressure of gas, and a branch supply-pipe leading to the pilot-light burner at a point between this burner and the gravity-valve.

3. A gas-burner of square or angular shape having a plate provided with jet-openings, and outwardly-projecting separating wings or ribs between the openings.

4. An angular gas-burner having a central portion provided with ribs or partitions extending outwardly around the same, and a plate below the same having jet-openings arranged to discharge upwardly into the spaces between the partitions.

604,210. TOOL HOLDER OR CARRIER FOR BICYCLES. JOHN O. GLASS, Reading, Pa. Filed June 12, 1897. Serial No. 640,451. (No model.)

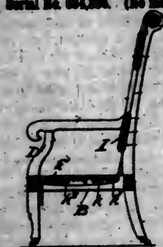


Claim.—1. A case or holder for the purpose herein described, said case or holder consisting of two similar parts hinged together at one side, a yoke-shaped frame the end plates of which are pivotally connected with the ends of the hinge-rod by which said parts are connected, a spring-plate secured to the top of said frame and extending on each side thereof and provided with a depending lug on the under side of each end thereof and adapted to engage a catch on each part of the case, and suitable means for securing the frame to a support, substantially as described.

2. A case or holder for the purpose herein described, said case or holder consisting of two similar parts hinged together at one side, a yoke-shaped frame the end plates of which are pivotally connected with the ends of the hinge-rod, by which the said parts are connected, supporting-links pivoted at one end to each of the end plates of the frame and at the other end to each of the hinged parts of the case, a spring-plate secured to the top of said frame and extending on each side thereof, and provided with a depending lug on the under side of each end thereof and adapted to engage a suitable catch on each part of the case, and straps connected with the frame for securing the case or holder to its support, substantially as described.

604,211. WAVE OR CURRENT MOTOR. GREAT LOVERING, Newark, Cal. Filed Dec. 3, 1897. Serial No. 660,668. (No model.)

Claim.—1. In a wave-power motor, a paddle-wheel fixed upon the lower end of a vertically-journaled shaft and connected with a float whereby it may be moved vertically to conform to the movements of the tide, a structure by which said shaft is supported and means whereby the inflow and reflex waves are directed upon opposite sides of the center of the paddle-wheel.



2. In a wave-power motor, paddle-wheels arranged in series diagonally to the line in which the waves approach, vertically-disposed shafts upon the lower ends of which the wheels are mounted and means whereby the wheels may rise and fall with the tide, a supporting structure for the upper portions of the shafts and diagonally-disposed channels in front of and behind the wheels whereby the inflowing and outflowing movements of the waves are directed upon opposite sides of the center of the wheels to produce a continuous movement of the wheels in one direction.

3. In a wave-power motor, vertically-journaled shafts mounted upon a supporting structure, paddle-wheels fixed at the lower ends of said shafts and dipping into the water, diagonally-disposed guiding sluices or channels whereby the inflowing waves are directed upon one side of the wheels, and the returning waves are directed upon the opposite side and a means whereby the wheels and shafts may be raised and depressed to suit the condition of the tide.

4. In a wave-power motor, a series of vertically-journaled shafts, a structure upon which they are supported in a line diagonal to the line of movement of the waves, paddle-wheels fixed upon the lower ends of said shafts to dip into the water, diagonally-disposed channels or chutes so fixed with relation to the wheels and the line of movement of the waves that the inflowing wave is directed against one side of the wheel and the outflowing wave against the opposite side to produce an approximately continuous motion in one direction, transmitting mechanism fixed to the upper ends of the shafts and connecting said wheel-shafts with a counter-shaft through which the power is transmitted.

604,212. CHAIR. ISAAC R. PALMER, Middletown, Conn. Filed Apr. 30, 1897. Serial No. 634,206. (No model.)

Claim.—1. The combination with a suitable chair-frame provided with separate cross bars or rungs placed in groups at intervals along the frame, of a fabric adapted to form a support for the body of the occupant said fabric having a return fold passing around one of the rungs of each group, and thence between a rung and the fabric which passes over the rung, for removably securing the fabric in position, substantially as set forth.

2. The combination with a suitable chair-frame and cross-rungs arranged in groups at intervals along the frame, of a fabric removably secured to said groups of cross-rungs and one or more frames adjustably engaged with the fabric, said frames being adapted to receive upholstery, substantially as set forth.

3. The combination with a suitable chair-frame and cross-rungs arranged in groups at intervals along the frame, of a fabric removably secured to said groups of cross-rungs to form a support for the body of the occupant and a sectional cant-frame, constructed to be extended and contracted, adjustably secured to the fabric, for receiving a cushion, substantially as set forth.

604,213. RADOR. ANDREW PHELPS, Newark, N. J. Filed Feb. 3, 1897. Serial No. 621,743. (No model.)

Claim.—1. The improved badge comprising the outer shell and its covering and an annular collet in cover-holding relation to said shell and covering, said collet having a pin-fastening tongue D, integral therewith, extending radially inward into the central opening of said collet and permitting the pointed end of the pin to be entered beneath from either of the opposite sides of said tongue into fastening relation to said tongue, and said pin secured to the collet at a point opposite the fastening-tongue D, substantially as set forth.

2. The improved badge comprising the outer shell, a covering therefor, a collet and pin, the collet being centrally apertured and separately perforated at one side of the central aperture, and having a pin-fastening tongue, D, at the side opposite said perforation and a tongue, G, to hold the curved part of the pin lying back of the pointed end beneath the said collet, and said pin having its pointed part lying approximately parallel with the plane of the collet and adapted to engage said pin-fastening tongue, D, and bent to lie in said pin-perforation and extended on the inner side of the collet and curved around the central aperture and held in place by said tongue, G, substantially as set forth.

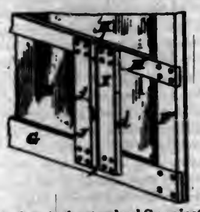
3. The improved badge comprising the outer shell, the cover, the annular collet having integral tongues G, projecting inward from the edge of the collet, and an integral pin-fastening tongue D, bent to receive and hold the point of the pin, and a pin having a straight outer part with a pointed end, and bent forward and passing through said collet and having a curved extension lying between the collet and shell and held concealed therebetween by said tongues G, said parts being arranged and combined, substantially as set forth.

4. In a badge, the combination with the annular collet having the perforation E', separate from the central opening thereof, tongue G and flange C', of a pin bent to extend through the perforation E', and again bent and curved to form an extension conforming to the concavity of said flange C', and held in said concavity by said tongue G, substantially as set forth.

5. In a badge, the combination with the shell and annular or centrally-open collet having inwardly-projecting integral tongues D and G, formed at its inner edges, one of which tongues is bent back and out of the plane of said collet and extends radially toward the center of the badge and is flanged on opposite sides of its longitudinal axis and concaved or recessed to receive the pin-point, the concavity or recess being open to the pin-point from opposite sides of said tongues and the other is bent to lie between the collet and shell to hold the pin, of a pin having a straight outer part lying back of the badge with a point adapted to enter the recess of the tongue D, and curved to conform to the collet and held by said tongue G, between said collet and shell, substantially as set forth.

6. The combination with the shell and annular collet the latter having an integral tongue D, projecting radially inward into its central opening and in the longitudinal line of the pin, of said pin adapted to be caught by said tongue and extended and bent to lie between the shell and collet, substantially as set forth.

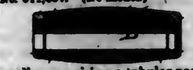
7. The combination with the shell, of an annular collet having a tongue G, extending from the edge thereof and bent inward between the shell and collet, and a resilient pointed pin having a curved extension also lying between said shell and collet and held in place by said tongue G, substantially as set forth.



8. The improved badge herein described, comprising an outer shell and a collet, the latter forming a central opening or aperture at the back of the badge and having a pin-perforation formed therein outside of and independent of said central aperture, and also having a backwardly-projecting radial catching-tongue, to receive the pointed end of the pin, of said pin having a curved extension rigidly held between the collet and shell, the curve conforming to the flange of said collet, and bent and extending through said pin-perforation in a direction substantially at right angles to the plane of the collet, said bend at the perforation holding the straight portion of the pin back and away from the back face of the collet a distance equal to the backward projection of the radial tongue substantially as set forth.

604,214. ICE-CREAM FREEZER. ROBERT L. PORTER and JOSEPH D. FAULKNER, Galena, Kans. Filed Mar. 2, 1897. Serial No. 625,751. (No model.)

Claim.—In an ice-cream freezer, the combination of a casing having compartments therein, with a rotary freezing-cylinder supported in bearings in the ends of the casing, adapted to revolve therein, the said cylinder having an operating-crank, angular strips secured longitudinally therein, adapted to receive the cream-holding tubes, and longitudinal openings, provided with a cover and perforations opposite the said opening substantially and for the purpose set forth.

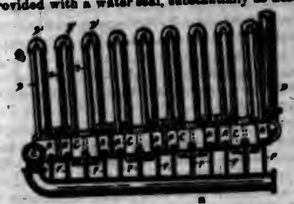


604,215. DETACHABLE FOOT FOR SCREENS, &c. WILLIAM J. QUARRY, Newport, Ky. Filed Nov. 5, 1897. Serial No. 657,823. (No model.)

Claim.—1. The foot A, the standard C, projecting upwardly therefrom; a screen-frame including a pair of vertical cleats I, J, and a fastener for retaining it in place; said parts being so combined and fitted together as to cause said foot to support the dead-weight of said frame, while lateral shifting is prevented by said cleats bearing against the opposite sides of said standard, thereby relieving said fastener of any material strain, all as herein described.

2. The foot A, having a transverse notch B in its upper edge; a rigid standard C, projecting upwardly from said foot, in the rear of said notch B, and provided with a perforation *c*; a screen-frame having attached to its back a pair of cleats I, J, provided, respectively, with perforations *i j*; and a fastener D adapted to traverse said perforations *c*, *i*, *j*; said parts being so combined and fitted together as to cause said foot to support the dead-weight of said frame, while lateral shifting of the frame is prevented by said cleats bearing against the opposite sides of said standard, thereby relieving said fastener from any material strain, all as herein described and set forth.

604,216. VELOCIPEDE-HANDLE. PAUL RACHEW, Brooklyn, N. Y., assignor to John S. Long's Son & Co., New York, N. Y. Filed Nov. 11, 1896. Serial No. 611,697. (No model.)

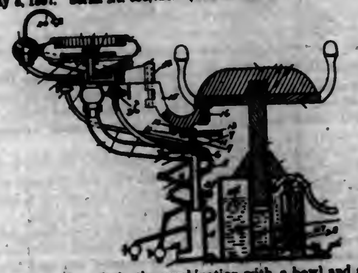


Claim.—A handle comprising a tubular paper core, an outer cup-shaped tip overlapping one end of the core and having an annular abutment around its interior wall against which the end of the core rests, an inner tip or ferrule overlapping the other end of the core and having an annular abutment around its interior wall against which the said end rests and a grip portion surrounding the core between the tips and forming an extension of their exterior walls, substantially as set forth.

604,217. HOT-BLAST RADIATOR. GEORGE I. ROCKWOOD, Worcester, Mass. Filed May 28, 1897. Serial No. 638,506. (No model.)

Claim.—1. The combination of a series of headers inclosing steam-chambers arranged in pairs, steam-pipes connecting the chambers in each pair, and disposed above the level of said chambers, with a steam-chamber in one pair communicating with a steam-chamber in the next adjacent pair, drip-pipes leading downward from each of said chambers discharging into a common pipe or header, a pipe or header having its discharge at a higher level than the lowest point of said drip-pipes, and a steam-pipe and a discharge-pipe at opposite ends of said series of headers, substantially as described.

2. The combination of a series of headers inclosing steam-chambers and arranged in pairs, a steam-pipe by which steam is admitted to the first in said series, radiating-pipes connecting said chambers in series, a discharge-pipe by which air is withdrawn from the last in said series, and drip-pipes leading downward from each of said chambers and provided with a water seal, substantially as described.



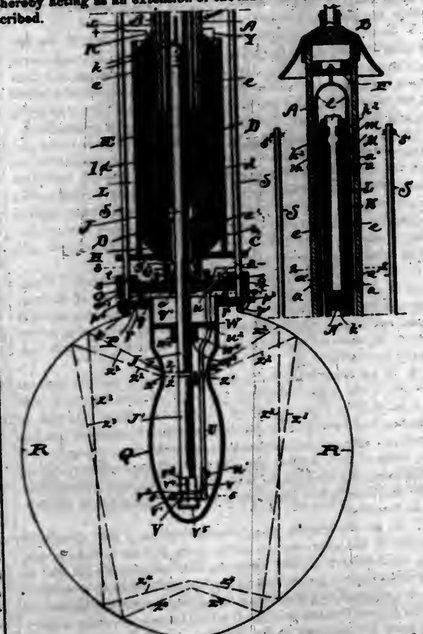
3. The combination of a series of headers inclosing steam-chambers connected alternately at opposite ends of said headers, steam-pipes extending upward from each alternate chamber and returning to the next adjacent chamber, and drip-pipes connecting each of said chambers with a common discharge-pipe, a discharge-pipe receiving said drip pipes and having its discharge at a higher level, a steam-pipe by which steam is admitted to the first header and a discharge-pipe by which air is withdrawn from the last header in said series, substantially as described.

4. The combination of a series of headers inclosing steam-chambers, radiating-pipes connecting said chambers, a steam-pipe admitting steam to the first header, a discharge-pipe through which air is withdrawn from the last header, drip-pipes connecting each of said headers with a common pipe or header at a lower level, and a pipe or header communicating with said air-discharge pipe at a higher level, substantially as described.

5. The combination of a series of headers A, each inclosing a pair of steam-chambers A^1 and A^2, steam-pipes B, connecting the chambers in each of said headers, passages connecting one of the chambers in said headers with a chamber in the adjacent header, drip pipes F leading downward to a common water-discharge pipe G, an air-discharge pipe E communicating with the last chamber in the series and also with the water-discharge pipe G and a steam-pipe through which steam is admitted to the first chamber in the series, substantially as described.

604,218. SPITTOON. ALBERT ROSENBERG, Baltimore, Md. Filed May 5, 1897. Serial No. 636,730. (No model.)

Claim.—1. In a chair, the combination with a bowl and a telescoping drain-pipe therefor; of a vertically-adjustable support, and a seat therefor rotatable independently of the said telescoping drain-pipe; suitable pipe connecting the bowl with the said telescoping drain-pipe; and means for adjusting the support and the telescoping drain-pipe vertically, substantially as described.



2. The combination with a bowl, suitable pipe therefor and an adjustable rotatable support; of a rail attached to the rotatable portion of said support and engaging said pipe, substantially as described.

3. The combination with a bowl, suitable pipe therefor and an adjustable rotatable support, a rail attached to the rotatable portion of said support; of rollers attached to said pipe and engaged by said rail, substantially as described.

4. In a spittoon, the combination with a revolving flushing-jet of a bowl having a contracted opening or mouth, and a flange extending downwardly toward the bottom of said bowl, substantially as described.

604,219. ELECTRIC-ARC LAMP. FRANK W. STEBBINS, and EDWIN F. COWLEY, Cleveland, Ohio. Filed Apr. 12, 1897. Serial No. 631,933. (No model.)

Claim.—1. In an electric-arc lamp, a telescoping holder composed of an outer stationary tube, and an inner movable tube in contact therewith, said inner tube being adapted to hold the movable carbon, and being adapted to slide up and down within the stationary tube, and, while the lamp is burning, being adapted to have its upper portion in the lower portion of the outer tube, said outer tube thereby acting as an extension of the inner tube, substantially as described.

2. In an electric-arc lamp, a telescoping holder composed of a stationary tube and a movable tube slidable within the stationary tube and contacting with it and receiving current from it and connected with the movable carbon, said movable tube being adapted to descend so that the upper end thereof is below the upper end of said stationary tube, whereby said stationary tube lengthens said holder, substantially as described.

3. In an electric-arc lamp, in combination, a stationary tube, a clutch below the same, a movable tube adapted to stand within said stationary tube and adapted to project downward beyond said clutch while in engagement with said stationary tube, said movable tube contacting with said stationary tube and receiving current from it and a movable carbon carried by said movable tube, substantially as described.

4. In an electric-arc lamp, in combination, the solenoid D, the sleeve E constituting its armature, the sleeve H, substantially within said sleeve E, clutch members G pivoted to said sleeve H and having outward projections adapted to be engaged by said sleeve, substantially as described.

5. In an electric-arc lamp, in combination, the sleeve H, clutch members G pivoted to said sleeve and adapted to engage a carbon extending through said sleeve, the sleeve E having holes e^3, the pins f projecting from said clutch members into said holes whereby movement of the sleeve E causes the clutch to assume engaging position, substantially as described.

6. In an electric-arc lamp, in combination, the sleeve H, clutch members G pivoted to said sleeve and adapted to engage a carbon extending through said sleeve, the sleeve E capable of movement independent of the sleeve H, means connecting said sleeve and clutch members whereby a movement of said sleeve causes the clutch members to assume engaging position, and a pin in one of said sleeves projecting into a slot in the other, whereby independent movement of the two sleeves is limited, substantially as described.

7. In an electric-arc lamp, in combination, the sleeve H, clutch members G pivoted to said sleeve and adapted to engage a carbon extending through said sleeve, the sleeve E capable of movement independent of the sleeve H, means connecting said sleeve and clutch members whereby a movement of said sleeve causes the clutch members to assume engaging position, and a stop limiting the absolute movement of both sleeves in the downward direction, substantially as described.

8. In an electric-arc lamp, in combination, a stationary plate, a pair of rods supporting a globe and passing through said plate, shoulders on said rods and a latch movable horizontally but held against vertical movement, said latch being adapted to engage with the shoulders on the rods and thereby hold the globe in its elevated position and being adapted to be withdrawn from such engagement and thereby allow the globe to descend, substantially as described.

9. In an electric-arc lamp, in combination, the plate O, the pivoted lever T above said plate and having diametrically-opposed forked ends *t*, the rods S supporting a globe and passing through said plate O, there being formed notches in said rods into which the said forked ends are adapted to take, and means for turning said lever about its pivot and thereby releasing said rods S, substantially as described.

10. In an electric-arc lamp, in combination, the plate O, the pivoted lever T above said plate and having diametrically-opposed forked ends *t*, the rods S supporting a globe and passing through said plate O, there being formed notches in said rods into which the said forked ends are adapted to take, the spring t^2 forcing said forked ends in the direction to engage said notches, and the cord or chain t^4 furnishing means for withdrawing said ends from engagement with said notches, substantially as described.

11. In an electric-arc lamp, in combination, the rods S S supporting a globe, notches *s s* formed in said rods, a pair of latching members substantially immovable vertically but movable horizontally and adapted to take into said notches, and means for insuring a community of motion or rest between said two latching members, substantially as described.

12. In an electric-arc lamp, in combination, a pair of rods on either side of the upper carbon of the lamp, notches formed in said rods, a latch-lever T pivoted about an axis coincident with that of said carbon and having ends with circumferentially-disposed notches t^3 which are adapted to take around said rods, there being formed on the walls of said notches the ribs t' which incline outwardly as they approach the entrance to the notch whereby they release their hold on said rods before the latter are clear of the notches, substantially as described.

13. In an electric-arc lamp, in combination, a pair of rods on either side of the upper carbon of the lamp, notches formed in said rods, a latch-lever T pivoted about an axis coincident with that of said carbon and having ends with circumferentially disposed notches t^3 which are adapted to take around said rods, there being formed on the walls of said notches the ribs t' which incline upwardly as they recede from the entrance to the notch, a stop limiting the upward movement of the rods at a point which causes the notches *s* to occupy a position intermediate of the position occupied by the lowest portion and the highest portion of said ribs, whereby the latch-lever is adapted to draw said rods tightly up to their highest position, substantially as described.

14. In an electric-arc lamp, in combination, the plate O, the thimble *o*, the lever T pivoted about said thimble and supported by said plate, the rods S S passing through said plate, forks on said lever adapted to take around said rods, there being notches in the rods and corresponding ribs on said forks, substantially as described.

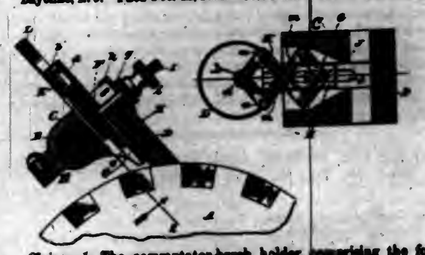
15. In an electric-arc lamp, the plate P having a depending flange *p* and having a hole through its center, in combination with the outer globe R supported by said flange and the inner globe Q extending through said hole and having the outwardly-turned flange *q* by which it is supported, substantially as described.

16. In an incandescent arc electric lamp, an inner globe surrounding the arc and adapted to inclose a more or less perfect vacuum, and a relatively large outer globe, said globes being each closed at their lower ends and being supported only at their upper ends, in combination with means for simultaneously raising or lowering both globes, substantially as described.

17. In an electric-arc lamp, in combination, the stationary plate O, the plate P, supported by rods passing through said plate O, a hole through the center of the plate P, a lamp-globe Q extending through said hole and having a flange *q* which extends over onto the plate P and means for holding said two plates apart, substantially as described.

18. In an electric-arc lamp, in combination, the stationary plate O, the plate P having a hole through its center, the lamp-globe Q extending through said hole and having a flange *q* projecting over onto the upper surface of the plate P, and the flange p^4 on the upper surface of the plate P surrounding the said flange *q*, and adapted to contact with said plate O, substantially as described.

19. In an electric-arc lamp, the combination, with the plate P and means for holding the same in place, of the depending inwardly-extending pivoted flange *p'*, said flange *p'* being pivoted at p^3 near one end, and having near the other end an upwardly-extending spring-lip p^4 adapted to take into a notch p^5 in the edge of said plate P and means for locking said lip to said plate and thereby holding the flange *p'* in place, substantially as described.



20. In an electric-arc lamp, in combination, the plate O supported by the frame of the lamp, the plate P supported beneath said plate O, the globe Q supported by said plate P, the rod U for supporting the lower carbon, said rod being supported by said plate O and a head W substantially closing the upper end of the globe Q, said rod U passing through said head, substantially as described.

21. In an electric-arc lamp, in combination, a lower-carbon holder consisting of a slotted thimble adapted to embrace the carbon, a split yoke surrounding the thimble, a screw passing from one part of the yoke into the other and adapted to clamp the same about the thimble, a tongue extending upwardly from said yoke, and a depending rod having a recess in its lower end into which recess said tongue is adapted to take, and means for locking said tongue into said rod, substantially as described.

22. In an electric-arc lamp, an inner globe adapted to surround the carbons and from its bottom upward first concave to the carbons and then convex and then cylindrical and having an outwardly-turned flange at its upper end which flange extends laterally farther than any of the portions below it, in combination with a plate having a hole through it of a diameter greater than the external diameter of said cylindrical part and less than the external diameter of said flange, said plate supporting said globe at its upper end and allowing its withdrawal upward from said plate, substantially as described.

23. In an electric-arc lamp, the combination, with suitable carbon-holders adapted to hold a pair of carbons in proper juxtaposition, of an inner globe surrounding the arc produced between the carbons, and an outer globe surrounding the inner globe, said globes being supported only at their upper ends whereby there is no obstruction by their supports to the rays of light emanating from the arc, there being rods operating to support both of said globes and slidable through a portion of the lamp connected to the frame, and means for latching or releasing said rods whereby said two globes may be simultaneously raised or lowered, substantially as described.

604,220. COMMUTATOR-BRUSH HOLDER. WILLIAM B. SCULL, Bayonne, N. J. Filed Feb. 12, 1896. Serial No. 579,099. (No model.)

Claim.—1. The commutator-brush holder, comprising the follower connected with the brush and the lazy-tong levers at one end connected with the follower and at the other end to the holder, combined with means for exerting spring-pressure laterally against the sides of said levers; substantially as set forth.

2. The commutator-brush holder, comprising the follower and the lazy-tong levers at one end connected with said follower and at the other end to said holder, combined with the spring L bearing against said levers at points *a*, *a*, substantially as set forth.

3. The commutator-brush holder having the front plate provided with the slot *e* and against which the brush is placed, combined with the follower, the levers K connected at one end with said follower and at the other end with said holder, means for exerting spring-pressure laterally against said levers, the screw connected with said follower, and extending through the slot in said front plate and engaging said brush, the plate *h* at the upper end of said brush, the adjusting-nut *i* upon said screw and the spring *g* intermediate said nut and said plate *h*; substantially as set forth.

4. The commutator-brush holder C having the front-plate F provided with the slot *e* and guiding-groove G, combined with the follower in said guiding-groove, the lazy-tong levers connected at one end with said follower and at the other end to said holder, the spring exerting a tension against said levers to elongate the same, the brush D against said front plate and having the slot *f*, the screw I connected with said follower and thence passing through the slot *e* in said front plate and the slot *f'* in said brush, the plate *h* and spring *g* upon said screw and the nut *i* upon said screw for pressing said spring *g* and plate *h* against said brush; substantially as set forth.

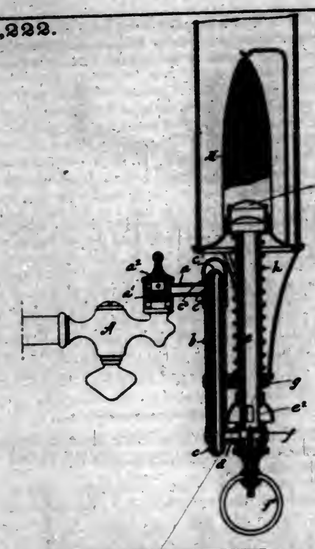
5. In a commutator-brush holder, the follower, and means connecting the follower with the brush, combined with the pivoted levers connected at one end with the follower and restrained at the other end, and a spring whose force is exerted to elongate said levers and move said follower and brush toward the commutator; substantially as set forth.

6. In a commutator-brush holder, the pivoted levers K, means connecting one end of said levers with the brush, and means restraining the other end of said levers, combined with a spring whose force is exerted to elongate said levers and move said follower and brush toward the commutator; substantially as set forth.

7. In a commutator-brush holder, the front plate having the slot *e*, the brush having the slot *f*, and the screw passing through said slots and having the nut, combined with the plate *h* and spring *g* on said screw and held against the brush by said nut, the spring L, and the pivoted levers intermediate said spring and said screw for transmitting the force of said spring to said screw and thereby to move said brush toward said commutator; substantially as set forth.

8. In a commutator-brush holder, the spring to drive the brush toward the commutator, and a pivoted lever operatively connected with said brush and spring, said lever normally extending transversely with respect to the brush when the spring is exerting its greatest force and pivoted to turn toward a parallel position with respect to the brush as the latter moves toward the commutator and the spring expends its force, whereby the lever by its changing position compensates for the decreasing force of the spring and renders the pressure of the spring on the brush substantially uniform during the shortening, by wear, of the brush; substantially as and for the purposes set forth.

604,221. CARD-DISPLAY CABINET. WILLIAM H. WICKENS, Indianapolis, Ind. Filed Sept. 27, 1897. Serial No. 653,220. (No model.)

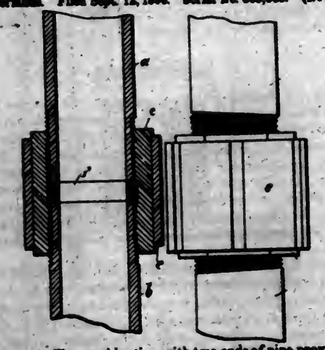


Claim.—1. A cabinet for the purposes described having approximately one-half of its front covered and having the inner side of one of its side walls cut away to form a shoulder, and adapted to receive a plurality of removable cards approximately the same in width and one-half the height, inside measurement, as the cabinet, substantially as described and specified.

2. A cabinet having the upper half of its front covered and having one of its sides of uniform thickness and having its other side of normal thickness at the top but sloping outwardly and downwardly on the inner side to approximately half the normal thickness midway of the length of the wall where the inclined part terminates forming a shoulder, said cabinet being adapted to receive a plurality of cards removably secured within the cabinet, substantially as described and specified.

3. A cabinet having the upper half of its front covered and having one side cut away to form an inside shoulder, a rock-shaft adjacent to the shoulder with an outside knob and an inside flanged and notched head, substantially as described, to engage and push the cards off of the shoulder, and adapted to receive a plurality of cards, all substantially as described and for the purposes specified.

604,222.



604,223. SPIKE-TOOTH HARROW-BAR. HENRY D. RADDOCK, Leonardsville, N. Y., assignor to the Standard Harrow Company. Filed July 30, 1897. Serial No. 646,638. (No model.)

Claim.—In a harrow the combination of a pair of crescent-shape bars, in cross-section, each bar provided with angular depressions in the opposing flanges of each crescent bar, said depressions being produced by pressure, forming at the angle of the depression a broad surface, angular harrow-teeth and bolts and nuts for clamping the teeth between the crescent bars, substantially as set forth for the purposes stated.

604,224. TUBE-COUPLING. ARIE W. F. BENNIK, Apeldoorn, Netherlands. Filed Sept. 12, 1896. Serial No. 605,653. (No model.)

Claim.—1. The combination with two ends of pipe provided with oppositely-directed screw-threads, of a divided nut placed around both of said ends and having corresponding threads and a strap or sleeve surrounding the nut, substantially as described.

2. The combination with two ends of pipe, of a main divided nut placed around the same, an auxiliary divided nut inclosed by the main nut and a sleeve surrounding the main nut, substantially as described.

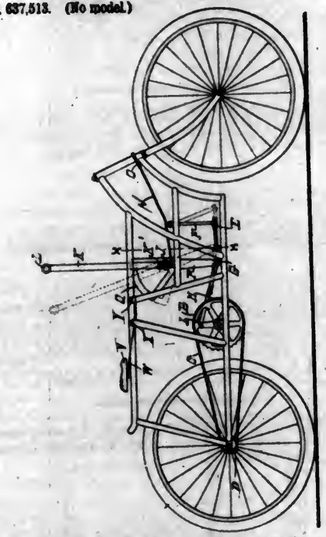
604,225. GATE FOR CARS. HENRY W. PRATT, Boston, Mass. Filed Aug. 2, 1897. Serial No. 646,706. (No model.)

604,222. GAS-BURNER. STEPHAN LAUBER and EDWARD O. GOTTLIEB, New York, N. Y. Filed Nov. 19, 1897. Serial No. 659,090. (No model.)

Claim.—1. The combination of a fixed incandescing body, a sliding tube having gas-outlets at one end adapted to be moved toward and away from the incandescing body, a fixed gas-tube in which a portion of said sliding tube moves, means for automatically regulating the supply of gas to the gas-outlets in accordance with the position of the sliding tube and air-inlets to said sliding tube open in all positions thereof.

2. A burner provided with a stationary incandescing body and comprising a stationary tube adapted for attachment to a gas-supply pipe and a sliding tube having gas-outlets at one end and provided with air-openings, said sliding tube adapted to move to carry its gas-outlets toward and away from the incandescing body while its air-openings are always open.

3. In a gas burner the combination of a fixed incandescing body, a stationary gas-tube, a U-shaped gas-tube, one leg of which is guided by the stationary tube while the other leg is provided with the gas-outlets and also with continuously-open air-inlets, and means for altering the supply of gas in accordance with the movement of the U-shaped tube.



Claim.—1. In a gate for cars, the combination with a car-seat, and its pivoted back, of a gate, or arm, pivotally mounted on the seat, and a bar-link pivoted to the gate and to the end frame of the seat-back.

2. In a gate for cars, the combination with two adjacent seats, each having arms at its ends, and a seat-back the end frames of which are pivotally mounted, of a gate, or arm, pivotally mounted on one of said seats to swing down onto the other seat within its arm, and a link pivoted to the gate and to the end frame of the seat-back.

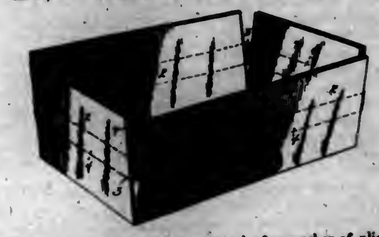
3. The combination with the seats 5 5 having the arms 6 6 and the uprights 7 7, the end frames 8 8 pivoted to the uprights and having the members 8' 8', and the seat-back 9 secured to said frames, of the bracket 10 mounted on one of the seats, the gate 11 pivoted in the bracket, and the link 12 pivoted to the gate and to the member 8' of one of the end frames.

604,226. BICYCLE. CHARLES R. CAIN, Milwaukee, Wis., assignor of one-half to Alfred R. Cain, same place. Filed May 21, 1897. Serial No. 637,513. (No model.)

Claim.—1. In a bicycle, the combination with the rear wheel, of a pair of drive-sprockets, suitable connections for communicating motion to said wheel, a reciprocatory pedal-rod suspended in the bicycle-frame, means for communicating motion therefrom to the drive-sprockets, an oscillatory bracket supported in said frame, with a hand-lever swiveled thereto, a connecting-lever adapted to communicate the motion of the hand-lever to the foot-actuated connections and means for disengaging said connecting-lever from the hand-lever whereby the latter may be permitted to move independently, substantially as described.

2. In a bicycle, the combination of a foot driving mechanism, an oscillatory bracket journaled in the bicycle-frame, a tubular hand-lever swiveled thereto, a connecting-lever fulcrumed to said bracket on the axis of its journals with its lower end connected with the foot driving mechanism and provided with a sector running through a slot in said hand-lever, a locking-bar located in said hand-lever and adapted to engage in a recess in said sector and rotatable handles connected with said locking-bar and arranged to actuate the latter with reference to its engagement in the notch in said sector, substantially as described.

3. In a bicycle, the combination of a foot driving mechanism, an oscillatory bracket journaled in the bicycle-frame, a hand-lever swiveled thereto and provided with offset downwardly-projecting arms, rods connected to said arms by a universal joint on the axis of the bracket-journals and united to the steering-head by a flexible connection, a lever fulcrumed to said bracket on the axis of its journals, and connected with the foot driving mechanism and a detachable connection between said hand-lever, and said connecting-lever, substantially as described.

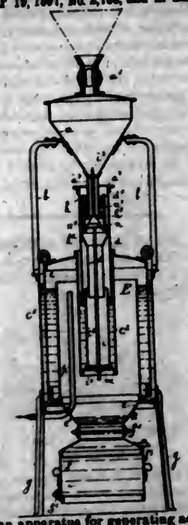


4. In a bicycle, the combination of a foot driving mechanism, an oscillatory bracket journaled in the bicycle-frame, a tubular hand-lever swiveled thereto and connected with the bicycle steering-head, a connecting-lever fulcrumed to said bracket on the axis of its journals and provided with a sector running through a slot in said hand-lever, a locking-bar located in the interior of the hand-lever and adapted to engage in a notch in said sector, handles adapted to rotate upon a handle-bar and connected by a rod running through an eye in the upper end of the locking-rod, with an eccentric fitted to said eye whereby the rotation of said handles is adapted to engage and disengage the locking-rod from the notch in said sector, substantially as described.

604,227. CAR-COUPLING. HARRY F. CAMP, Carpenter, Pa., assignor of one-half to Fred Henry Trippe, Canton, Pa. Filed Sept. 14, 1897. Serial No. 651,635. (No model.)

Claim.—An improved automatic car-coupling comprising the approximately U-shaped draw-head having one of its arms formed with the rectangular recess 5 having the beveled wall 6 and vertical orifice 11 in combination with the gravity coupling-block 12 formed with the beveled face 7 and provided with the vertical pin 9 journaled in said orifice 11 in the draw head so as to permit of a vertical and an oscillating movement of said coupling-block in said draw-head, substantially as shown and described.

604,228. FOLDING BOX. MARK B. CLAFF, Perry, N. Y. Filed Jan. 20, 1897. Serial No. 619,961. (No model.)



Claim.—1. A folding box composed of a number of plies, and having the inner plies of the folding sides terminating short of the extremities of the outer plies to provide matching corners, and having longitudinal channels formed between the plies of the folding sides intermediate of their top and bottom edges and extending the entire length thereof, and a tape or like connection passing loosely through the said longitudinal channels and concealed and protected thereby when the box is folded, said tape having its loose end passing outwardly through an opening midway the ends of a side and adjacent to the fold between the said side and bottom, substantially as and for the purpose specified.

2. In a folding box, the combination with the folding sides having longitudinal passages formed in three of the sides intermediate of their top and bottom edges and extending the entire length thereof, and having an oblique passage in the fourth side, of a tape or similar connection secured at one end to the side having the oblique passage and passing loosely through the passages of the other sides and through the said oblique passage and out through an opening communicating therewith and in line with the base or cover, substantially as set forth for the purpose described.

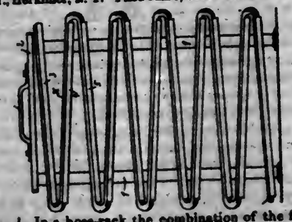
3. A folding box composed of telescoping sections similarly constructed, each section having its folding sides composed of a series of layers having longitudinal passages formed between them, and having the inner layers terminating short of the outer layers, whereby the adjacent ends of contiguous sides overlap, and one of the sides having an oblique passage, and a tape or like connection secured at one end to the side having the oblique passage and passing loosely

through the passages of the other sides and through the said oblique passage and out through an opening communicating therewith and about in line with the base or cover, substantially as set forth for the purpose described.

604,229. APPARATUS FOR MANUFACTURING ACETYLENE GAS. HENRI COUSIN, Paris, France. Filed May 1, 1897. Serial No. 634,690. (No model.) Patented in Belgium Nov. 26, 1896, No. 124,006; in Luxemburg Mar 19, 1897, No. 2,736, and in England Apr. 3, 1897, No. 8,502.

Claim.—1. In an apparatus for generating acetylene, the combination of a suitable frame, a hopper supported thereby and having an outlet-orifice at its lower end, a sleeve extending downwardly from said hopper and surrounding the outlet-orifice, an inner sleeve fixed to the aforesaid sleeve, a gas-holder guided in said frame, an outer casing extending downwardly from the top of the gas-holder and arranged within the same, an inner casing extending upwardly from the lower part of the outer casing, said outer sleeve on the hopper extending down between the said casings and said inner sleeve extending down into the inner casing, a spring-retracted valve-stem passing through the outer casing and inner sleeve and having a valve above said inner sleeve for opening and closing the said outlet-orifice of the hopper, means for guiding the valve-stem, means connected with the outer casing for lowering the valve-stem and unseating the valve, and a generator located below and within said holder, substantially as set forth.

2. In an apparatus for generating acetylene, the combination of a supporting-frame, a hopper provided with a valve-seat, a valve carried by said hopper, a spring attached to the hopper and adapted to seat said valve, a gas-holder guided by said frame, a generator located below and within said holder, an outer casing secured to said holder and extending into the generator, an inner casing concentric with said outer casing, an outer sleeve secured to the hopper and extending into the said outer casing, an inner sleeve attached to said outer sleeve and extending into said inner casing, a valve-stem extending downwardly through the inner sleeve and the inner casing, and a nut threaded on the end of the valve-stem and adapted to be engaged by the outer casing as the gas-holder descends, whereby the valve is unseated, substantially as set forth.

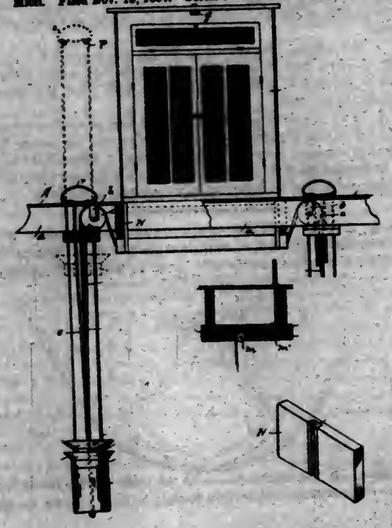


604,230. VALVE FOR HYDRAULIC ELEVATORS. JESSE P. DAVIS, Ludlow, Ky., assignor to the Warner Elevator Manufacturing Company, Cincinnati, Ohio. Filed Sept. 27, 1897. Serial No. 653,101. (No model.)

Claim.—1. In a valve for hydraulic elevators the combination of the main-valve cylinder or seat having closed ends and perforated in the chambered heads of the main supply-pipe, the pipe leading to the elevator-cylinder and the exhaust leading to the sewer, the valves controlling the supply and exhaust from said heads and having a stem extending through one end of the cylinder or seat, the pilot-valve for operating said main valves communicating with the supply from the main through the head of the main supply and having its exhaust communicating with the head of the discharge or sewer pipe and having supply-ports communicating with each end of the main-valve cylinder, connected piston-valves controlling the supply and exhaust ports of the pilot-valve, said pistons barely covering the openings of the supply-valve and having guide-wings upon each end and a stem extending through the pilot-valve case, the link connected to the pilot-valve stem and main-valve stem, a rocking lever, a link connecting the rocking lever and the link to which both valve-stems are connected, and the cross-lever having ropes or cables extending into the car for actuating the rocking lever and moving the pilot-valve and main valve in either direction or stopping it in the center, substantially as shown and described.

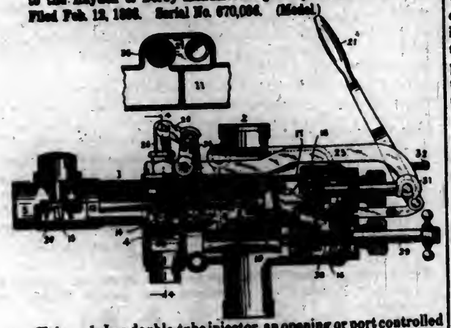
2. The hereinbefore-described pilot-valve for hydraulic elevators, consisting of the case having a central receiving-port to connect with the water-main, supply-ports upon each side thereof and the exhaust-ports having a central discharge, a bored seat communicating with said ports, a double piston-valve fitting said bore, controlling the supply-ports, barely covering the same without lapping and having guide-wings upon their ends, the stem of said valve extending through the end of the case to be connected to operating mechanism, and the heads closing the ends of said valve-case, combined and arranged substantially as set forth.

604,231. HOSE-RACK. IRVING R. DEVENDORF and CHARLES I. EARL, Jr., Herkimer, N. Y. Filed Jan. 3, 1898. Serial No. 666,006. (No model.)



Claim.—1. In a hose-rack the combination of the frame and a series of incline shelves converging and diverging as shown, whereby a constant inclination is given to the hose placed thereon.

2. The combination in a hose-rack of a frame and a series of incline shelves in pairs on opposite sides of the frame converging and diverging as shown, whereby a constant inclination is given to the hose placed thereon, substantially as set forth.



3. The combination in a hose-rack of the frame and a set of incline grooved shelves converging and diverging whereby a constant inclination is given to a hose placed thereon, substantially as set forth.

604,232. DUMB-WAITER. WILLIAM R. PITCHER, Pinnebog, Mich. Filed Nov. 15, 1897. Serial No. 658,363. (No model.)

Claim.—The combination with a provision-safe, a main counterweight for said safe, a cord connecting said safe and counterweight, and a sheave over which said cord passes, of an auxiliary weight adapted to be added to said main counterweight, cords whereby said auxiliary weight may be lifted from said main weight, means for sustaining said auxiliary weight in this lifted position, and a dish on said auxiliary weight arranged to take up the lifting-cords of said auxiliary weight as they are slackened, substantially as described.

604,283. INJECTOR. JACOB HUBER, Bridgeport, Conn., assignor to the Hayden & Derby Manufacturing Company, New York, N. Y. Filed Feb. 12, 1898. Serial No. 670,096. (Model.)

Claim.—1. In a double-tube injector, an opening or port controlled by an automatic valve between the discharge-chamber of the lifting apparatus and a passage which contains the overflow-port of the forcing apparatus, and a final positive overflow-valve constructed to choke the mouth of the communicating passage from said automatic valve without closing said passage, as set forth.

2. In a double-tube injector, an opening or port in the discharge-chamber of the lifting apparatus, an automatic valve controlling said opening or port, a communicating passage leading from said opening or port to the overflow-port of the forcing apparatus controlled by a final overflow-valve, the respective valves being located in close proximity, as shown, and with no intervening chamber wherein an expansion of the steam can take place, as described.

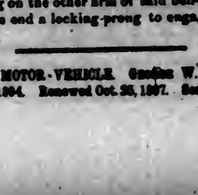
3. In an injector a check-valve operating within a separable section of the injector-casing, and joined thereto by means of a flanged joint, whereby the main body of the injector may be separated and removed therefrom by a longitudinal movement without rotation and the interior parts of the injector rendered accessible for removal or repair, as set forth.

4. In an injector, a casing made in two or more parts, a check-valve located in the casing containing the discharge-outlet to the boiler, said check-valve casing being joined to the main injector-casing by means of a flanged joint, whereby the injector-casing containing the operative parts of the injector can be removed from the casing containing the check-valve without disturbing or breaking the discharge or delivery connection to the boiler, as shown and described.

5. In a double-tube injector, a lifting steam-nozzle 6, a steam-valve 16 and a hole 30 in said nozzle, which shall admit sufficient steam to nozzle 6 to enable the injector to work when the valve 16 is closed, as set forth.

6. In an injector a main steam-valve, a stem to operate the same and a bar connecting with the overflow-valve, said bar having forks or prongs engaging the stem of the steam-valve, whereby the bar 23 can be disengaged from the spindle of the main steam-valve and the overflow-valve may be independently operated, as set forth.

604,284. ENDLESS-CHAIN CONVEYER. WILLIAM P. HUNT, West New Brighton, N. Y., assignor to the C. W. Hunt Company, New York, N. Y. Filed Nov. 15, 1897. Serial No. 658,517. (No model.)

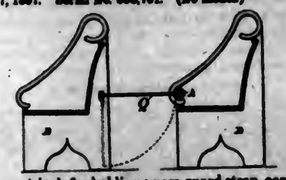


Claim.—1. The combination with the chain and the pivots in an endless-chain conveyer, of buckets notched at their ends for the pivots, and removable pivot-plates at the notches and means for connecting such removable pivot-plates to the bucket ends, substantially as set forth.

2. The combination with the chains in an endless-chain conveyer, of buckets and pivotal supports on the chains and a projection at the end of each bucket above the pivot and to the rear of such pivot, and a stationary cam for acting upon such projections and tipping the buckets to change the lap of the lips, substantially as set forth.

3. The combination with the chains in an endless-chain conveyer and the cross-bar pivots, of buckets notched at their ends to receive the pivots, removable pivot-plates and means for securing the same to the ends of the buckets over the pivot-bars, cams upon the ends of the buckets and below the pivots and stationary cams for engaging the cams on the buckets in tipping the buckets for discharging the contents and projections upon the ends of the buckets above the pivots and to the rear of such pivots at one end for engaging a stationary cam to change the lap of the lips, and similar projections at the other ends of the buckets but forward of the pivots, so that the buckets can be changed end for end between the chains, substantially as set forth.

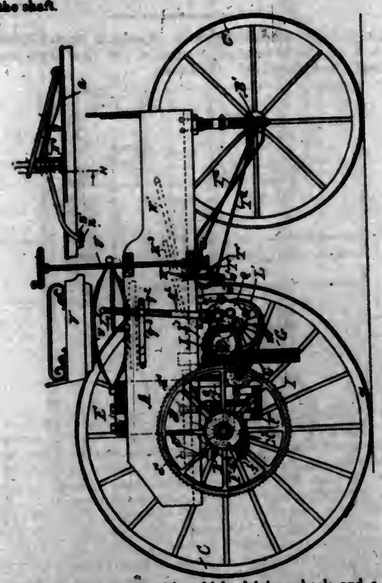
604,285. ART OF BUILDING SUBMERGED STONE AND CONCRETE STRUCTURES, &c. DENIS JORDAN, San Francisco, Cal., assignor to Mary L. McNamara, same place. Filed May 8, 1897. Serial No. 635,602. (No model.)



Claim.—1. A buoyant, movable support having a well that is open both at the ends and at the bottom to the surrounding body of water; in combination with a suspended and movable platform in said well, and suspending ropes and tackle for supporting the said platform and lowering it into the water consisting of slings detachable from the platform, pulley-blocks attached to said slings, pulley-blocks attached to the movable support along the sides of the well above the platform, a rope connecting the lower blocks and the upper blocks in alternate order and winding-drums on the buoyant support to which said rope is connected, as a means of lowering the platform in the well while sustaining it in horizontal position.

2. A buoyant, movable support having a well open both at the ends and at the bottom to the surrounding body of water, and a suspended vertically-movable platform in said well detachable from the buoyant support; in combination with anchored, movable pontoons, and cables and windlasses connecting said buoyant support with the pontoons.

3. A buoyant, movable support composed of two members having water-tight compartments and united at the ends to partially inclose between them a well open at the bottom and the ends; in combination with a vertically-movable and detachable platform in said well and ropes and tackle adapted to suspend and lower said platform in the well between the two members comprising the buoyant, movable support.



604,286. PEW-GUARD. REILLY T. KERVICK, Baltimore, Md. Filed Nov. 17, 1897. Serial No. 658,781. (No model.)

Claim.—A lock for holding a pew-guard strap, comprising a lock-case having a central pivot hole, *c*, in each of two opposite sides and an opening, *g*, in its rim; a bell-crank-shaped lever having trunnions that fit in said pivot-holes, said trunnions being exposed exteriorly and having a keyhole, and one arm of said lever having a hook-catch, *k*; a spring pressing on the other arm of said bell-crank lever; and a strap having at one end a locking-prong to engage with said hook-catch, as set forth.

604,287. MOTOR-VEHICLE. Gustus W. Lewis, Chicago, Ill. Filed June 14, 1894. Renewed Oct. 26, 1897. Serial No. 656,218. (No model.)

Claim.—1. The combination with vehicle driving-wheels and a prime mover of a speed-changing, reversing and power-disconnecting mechanism comprising a friction-disk, a shaft extending across the face of the disk, said shaft consisting of two parts or sections connected by a universal or flexible joint and one of which sections is mounted in fixed bearings on the machine-frame, gearing connecting said last-named section of the shaft with the vehicle driving-wheel, a pulley mounted on the movable section of the shaft and movable endwise thereon from one side of the disk to the other across the face of the disk, a movable bearing for the free end of the movable section of the shaft, means for giving movement to the said bearing and an actuating device connected with said pulley for moving it endwise on the shaft.

2. The combination with vehicle driving-wheels and a prime mover of a speed-changing, reversing and power-disconnecting mechanism comprising a friction-disk, a shaft extending across the face of the disk, said shaft consisting of two parts or sections connected by a universal or flexible joint and one of which sections is mounted in fixed bearings on the machine-frame, gearing connecting said last-mentioned section of the shaft with the driving-wheels, a pulley mounted on the movable section of the shaft and movable endwise thereon from one side of the disk to the other across the face of the disk, a movable bearing for the free end of the movable section of the shaft, an oscillating arm supporting said bearing, means connected with said arm for actuating the bearing comprising a foot-lever having rigid attachment to said arm and an actuating device connected with said pulley for moving it endwise on the shaft, substantially as described.

3. The combination with vehicle driving-wheels and a prime mover of driving-gear comprising a friction-disk, and a pulley adapted for contact with said disk, a movable shaft with which the pulley has longitudinally-sliding but non-rotative connection, a movable bearing for said shaft, a spring applied to throw the shaft away from the friction-disk, an actuating-lever for forcing the shaft toward the disk and a locking device acting on said lever with spring-pressure, substantially as described.

4. The combination, with vehicle driving-wheels and a prime mover, of a driving-gear comprising a friction speed-changing, reversing, and power-disconnecting mechanism, and a spur-gear speed-changing mechanism interposed between the said friction speed-changing, reversing, and disconnecting mechanism, and the vehicle driving-wheels, substantially as described.

5. The combination with vehicle driving-wheels and a prime mover, of driving connections, comprising a friction-disk, a pulley adapted for contact with the face of the disk, which pulley is movable to either side of the center of the same, and a spur-gear speed-changing mechanism consisting of an oscillating frame carrying two pinions, gearing driving the same at different speeds, and a single gear-wheel adapted to be engaged by either pinion, substantially as described.

6. The combination with vehicle driving-wheels and a prime mover, of driving connections comprising a friction-disk, a pulley adapted for contact with the face of the disk, which pulley is movable to either side of the center of the disk and is also movable toward and from the face of the disk, and a spur-gear speed-changing mechanism consisting of an oscillating frame carrying two pinions, gearing driving the same at different speeds, and a single gear-wheel adapted to be engaged by either pinion, substantially as described.

7. The combination with vehicle driving-wheels and a prime mover, of a driving-gear, comprising a stationary gear-wheel through which motion is transmitted to the driving-wheels, an oscillating frame, two pinions mounted on the frame either of which may be engaged with the said gear-wheel by oscillation of the frame, and gearing on the frame by which one of said pinions is driven faster than the other, substantially as described.

8. A driving-gear comprising an oscillating frame, a driving-shaft mounted on said frame, a pinion attached to said shaft, a shaft carrying a second pinion, a stationary gear-wheel with which either of said pinions may be engaged by oscillation of the frame, an intermediate shaft mounted on the frame, and gear wheels and pinions attached to said shafts whereby motion is transmitted from the driving-shaft through the medium of the intermediate shaft to the shaft which carries the second pinion, substantially as described.

9. The combination with vehicle driving-wheels and a prime mover of a driving-gear comprising a friction-disk, a pulley adapted for contact with the face of the disk, a shaft supporting said pulley with which said pulley has longitudinal sliding but non-rotative connection, said shaft consisting of two parts connected by a flexible joint, a movable bearing engaging the part of the shaft on which the pulley is mounted, an oscillating frame in which the other part of said shaft is mounted, gear-pinions on said frame which are driven from said shaft by gearing giving greater speed to one pinion than to the other and a gearing-wheel with which either of said pinions may be engaged by oscillation of said frame, substantially as described.

10. The combination with vehicle driving-wheels and a prime mover, of driving connections comprising a friction-disk, a pulley adapted for contact therewith, a shaft with which the pulley has longitudinally-sliding but non-rotative connection, said shaft consisting of two parts united by a universal joint on one of which parts the pulley is mounted, a movable bearing for the part of the shaft on which the pulley is mounted, an oscillating frame supporting the other part of said shaft, a pinion on the part of said shaft carried by said oscillating frame, a second pinion mounted on said frame, gearing on the frame by which the said second pinion is driven and a gear-wheel with which either of said pinions may be intermeshed by the rocking of the oscillating frame, substantially as described.

11. The combination with vehicle driving-wheels and a prime mover of a driving-gear comprising a stationary gear-wheel, an oscillating frame, two pinions mounted on the frame either of which may be engaged with the gear-wheel, gearing on the frame by which one of said pinions is driven faster than the other and an actuating-lever attached to the said frame and provided with a locking device for holding the frame in a desired position, substantially as described.

12. The combination with vehicle-wheels and a prime mover, of driving connections comprising an oscillating frame, two pinions mounted on the frame, gearing driving said pinions at different speeds, a gear-wheel with which either of said pinions may be engaged by oscillation of the frame, a friction-disk, a pulley adapted for contact with the face of the disk, a shaft with which said pulley has longitudinally-sliding but non-rotative connection, said shaft consisting of two parts united by a flexible joint one of which parts is mounted in said oscillating frame, a movable bearing for the part of said shaft which carries said pulley, an actuating-lever connected with said bearing for moving the same, a spring applied to throw the pulley away from the disk and a locking device for engaging the actuating-lever to hold the pulley in contact with the disk, said locking device embracing a spring by which the actuating-lever is held with yielding pressure, substantially as described.

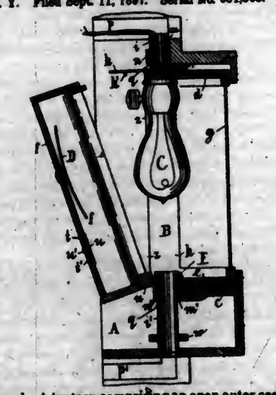
13. The combination with vehicle driving-wheels of a prime mover, the crank-shaft of which is arranged at right angles with the axis of rotation of the driving-wheels, a friction-disk mounted on said shaft, a friction-pulley adapted for contact with the face of the disk, a shaft with which said pulley has longitudinally-sliding but non-rotative connection, said shaft being arranged parallel with the axis of rotation of the driving-wheels and movable toward and from the face of the disk, a spur-gear speed-changing device embracing an oscillating frame adapted to rotate or swing on a horizontal axis parallel with the axis of rotation of the driving-wheels, gearing connecting said speed-changing device with the driving-wheels, substantially as described.

14. The combination with vehicle driving-wheels and a prime mover, the crank-shaft of which is arranged at right angles with the axis of the driving-wheels, of a friction-disk attached to said shaft,

a pulley adapted for contact with the face of the friction-disk, a horizontal shaft with which said pulley has sliding but non-rotative engagement, said shaft being movable toward and from the disk, an actuating-lever for moving the pulley endwise on the shaft, an actuating-lever for moving the shaft toward and from the disk, an oscillating frame carrying two pinions gearing on the frame actuated by said shaft and driving said pinions at different speeds, a gear-wheel with which either of said pinions may be engaged by oscillation of said frame, an actuating-lever attached to the frame for moving the said frame, and a gear-wheel on the driving-wheel axle intermeshing with said gear-wheel last mentioned, substantially as described.

15. The combination with vehicle driving-wheels, a frame and a prime mover, of a revolving axle through which motion is transmitted to the driving-wheel, and bearings for said axle comprising a shell or casing attached to the vehicle-frame, antifriction-rollers mounted in said shell and engaging the upper surface of the axle-bearing, pins for the rollers resting in sockets in the frame, a cap holding the axle in place in the bearing, and flanges or collars on the axle bearing against the side faces of the rollers and the cap, substantially as described.

16. The combination with vehicle driving-wheels, a frame and a prime mover, of an axle through which motion is transmitted to the driving-wheels, bearings for the axles located beneath the frame, bolts for connecting the said bearings with the frame, said bolts being arranged vertically and passing loosely through the said bearings, and coiled springs interposed between the bearing-boxes and the frame, substantially as described.

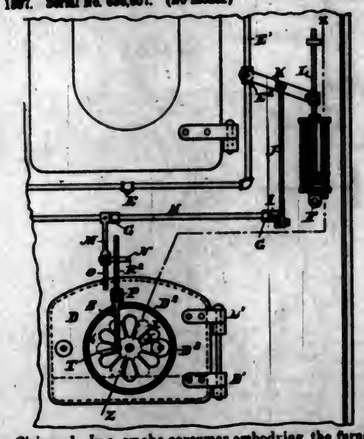


17. The combination with a vehicle-body driving-wheels at the rear of the body and a motor for actuating driving-wheels, supporting-wheels in front of the body, an axle for the same pivotally connected with the body, and a steering gear comprising a transverse shaft provided with two drums, ropes connecting the axle with the drums, and means for turning said shaft on which the drums are mounted, one of said drums being adjustably connected with the shaft whereby the ropes may be tightened, substantially as described.

604,238. SPECTACLE EYE GUARD OR SHIELD. PETER HERNEY, Attleborough, Mass. Filed Sept. 15, 1897. Serial No. 651,708. (No model.)

Claim.—As a new article of manufacture, an eye guard or shield consisting of a non-absorbent flexible frame formed in a single integral structure having two lens portions separated by a central integral transverse tie, and provided with an integral horizontal flange having ventilating-openings, and flexible lenses held in the lens portions.

604,239. LANTERN FOR OVENS. FERDINAND C. STOLZ, New York, N. Y. Filed Sept. 11, 1897. Serial No. 651,365. (No model.)

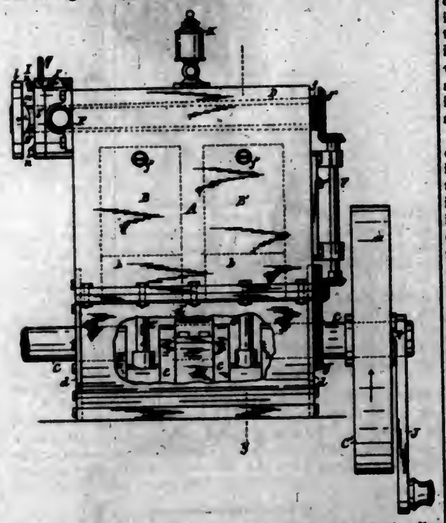


Claim.—1. A lantern comprising an open outer case or frame and a closed inner case, rotatably mounted therein, hollow trunnions communicating with the inner case and through the outer case with flues provided in the wall of the oven, a lighting-fixture and a reflector secured in the inner case, means for turning the inner case within the outer case and means for securing the inner case in position relatively to the outer case.

2. The combination with a frame adapted to be immersed in the wall of an oven, of a cylindrical case adapted to contain a lighting-fixture and an adjustable reflector and provided with hollow trunnions connecting the inner space of the case with flues provided in the wall above and below the outer case

3. The combination with an open outer case or frame and a closed inner case, rotatably mounted therein, and adapted to contain a lighting-fixture and an adjustable reflector, of hasps secured to the top beam and tie of the outer frame, springs riveted to the hasps and knobs secured to the springs in position to engage bores provided in the trunnions of the inner case and thereby to lock the inner case in position when the hasps are fastened.

604,240. SMOKE-CONSUMER. HAROLD L. THOMAS, Brooklyn, N. Y., assignor to Sumner T. Dunham, of New York. Filed May 15, 1897. Serial No. 636,657. (No model.)



Claim.—1. In a smoke-consumer embodying the furnace-door, steam-jet valve, dash-pot which opposes the steam-jet-valve-closing apparatus, and a knuckle-lever mounted in front of the door upon a rod having a crank connection with the dash-pot and valve and which is operated by the opening of the furnace-door to open the steam-jet valve but knuckles under without operating to close the valve when said door is shut; a weighted pressure device mounted on said door which operates mechanism adapted to close said steam-jet valve against the resistance of the dash-pot when the furnace-door is shut, substantially as shown and described.

2. In a smoke-consumer, the combination of the furnace-door, steam-jet valve, dash-pot which opposes the steam-jet-valve-closing apparatus, and a knuckle-lever which is connected to a rod journaled in the front of the furnace and said rod having a crank carrying a vertical rod pivoted to a link connected to the steam-valve and said dash-pot plunger, and is operated by the opening of the furnace-door to open the steam-jet valve but knuckles under without closing the valve when said door is shut, together with a curved bell-crank arm mounted on said door and engaging the valve-actuating apparatus when the door is shut and a weight tending to turn said bell-crank in a direction to close said valve, substantially as described.

3. In a smoke-consumer, the combination of the furnace-door, steam-jet valve, dash-pot which opposes the steam-jet-valve-closing apparatus and a knuckle-lever projecting in front of the said lever which is operated by the opening of the furnace-door to open the steam-jet valve but knuckles under without closing the valve when said door is shut, means for operating the said lever with relation to the steam-jet valve and dash-pot and with a curved bell-crank arm mounted on said door and engaging the valve-actuating apparatus when the door is shut, and a weight tending to turn said bell-crank in a direction to close said valve, together with an air-valve and connections whereby the closure thereof is controlled by said bell-crank, substantially as described.

604,241. GAS-ENGINE. DANIEL M. TUTTLE, Oneida, N. Y. Filed Dec. 17, 1896. Serial No. 615,965. (No model.)

Claim.—1. In a gas-engine, the combination with the casing, a plurality of cylinders having inlets and outlets, pistons, and a driving-shaft having cranks connected to the pistons, of rotary supply and exhaust tubes journaled in said casing and provided with apertures for opening the said inlets and outlets, said apertures being located at different points on the periphery and different points along the length of each tube, gearing between the driving-shaft and the rotary tubes to rotate the tubes continuously, electric igniting means for each cylinder, and a commutator to control the passage of the electric currents through the cylinders, as set forth.

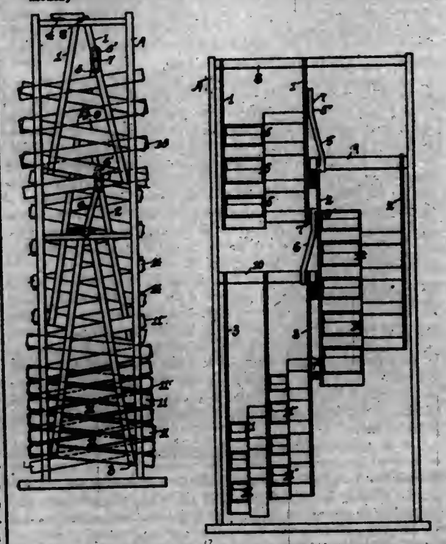
2. In a gas-engine, the combination with the casing, a plurality of vertical cylinders having inlets and outlets in their upper ends, pistons, and a horizontal driving-shaft passing through the casing below the cylinders and having cranks connected by pitmen with the pistons, of a pair of rotary tubes journaled in said casing above the cylinders and parallel with the driving-shaft, said tubes having apertures in opposite sides to open the inlets and outlets in the cylinders, gearing between the driving-shaft and the said rotary tubes to rotate the tubes continuously, electric igniting means for each cylinder, and a revolving commutator to control the passage of the electric currents through the cylinders, as set forth.

3. In a gas-engine, the combination with the casing, a pair of cylinders in the casing side by side, said cylinders having each an inlet and an outlet, pistons, and a driving-shaft having a pair of cranks on one and the same side of the shaft, pitmen connecting the cranks with the pistons, of a pair of rotary tubes having apertures in opposite sides to open and close the inlets and outlets in the cylinders, gearing between the driving-shaft and the tubes to rotate the tubes continuously, and suitable igniting means for each cylinder, as set forth.

4. In a gas-engine, the combination with the casing, a pair of cylinders in the casing side by side, said cylinders having each an inlet and an outlet, pistons in the cylinders, and a driving-shaft having a pair of cranks on one and the same side of the shaft, pitmen connecting the cranks with the pistons, of a pair of rotary tubes passing through the casing and having apertures therein to open and close the inlets and outlets in the cylinders alternately, gearing between the driving shaft and the tubes to rotate the tubes continuously, a commutator operated by the engine to control electric currents through circuits, and electric igniting means within each cylinder connected with the circuits, as set forth.

5. In a gas-engine, the combination with the casing, a pair of cylinders in the casing side by side, said cylinders having each an inlet and an outlet, pistons in the cylinders, and a driving-shaft having a pair of cranks on one and the same side of the shaft, pitmen connecting the cranks with the pistons, of a pair of rotary tubes passing through the casing and having apertures therein to open and close the inlets and outlets in the cylinders alternately, gearing between the driving-shaft and the tubes to rotate the tubes continuously, a commutator operated by the engine to control electric currents through circuits, electric igniting means within each cylinder connected with the circuits, and an adjustable part in said commutator to vary the time of closing the circuits, as set forth.

6. In a gas-engine, the combination with the casing, a plurality of cylinders having inlets and outlets, pistons, and a driving-shaft having cranks connected to the pistons, of tapered rotary supply and exhaust tubes journaled in said casing and provided with apertures for opening the said inlets and outlets, gearing between the driving-shaft and the rotary tubes to rotate the tubes continuously, electric igniting means for each cylinder, and a commutator to control the passage of the electric currents through the cylinders, as set forth.



7. In a gas-engine, the combination with the casing, a plurality of cylinders having inlets and outlets, pistons, and a driving-shaft having cranks connected to the pistons, of rotary supply and exhaust tubes journaled in said casing and provided with apertures for opening the said inlets and outlets, said tubes being tapered and provided with means to force them endwise, gearing between the driving-shaft and the rotary tubes to rotate the tubes continuously, electric igniting means for each cylinder, and a commutator to control the passage of the electric currents through the cylinders, as set forth.

8. In a gas engine, the combination with the casing, a plurality of cylinders having inlets and outlets, pistons, and a driving-shaft having cranks connected to the pistons, of rotary supply and exhaust tubes journaled in said casing and provided with apertures for opening the said inlets and outlets, said tubes being tapered, loose plugs in the ends of the shafts to turn the latter, a spring to force the tubes endwise, gearing between the driving-shaft and the rotary tubes to rotate the tubes continuously, electric igniting means for each cylinder, and a commutator to control the passage of the electric currents through the cylinders, as set forth.

9. In a gas-engine, a pair of cylinders, pistons, and a crank-shaft connected with the pistons, rotary valves for the cylinders operated continuously by the crank-shaft, a commutator operated by the engine, having a rotatable part carrying a rubber and an adjustable part carrying spring-contacts in the path of the rubber, a primary electric circuit having branches containing the spring-contacts and the primaries of induction-coils, and secondary circuits leading from the coils to igniting means in the said cylinders, as set forth.

10. In a gas-engine, a pair of cylinders, pistons, and a crank-shaft connected with the pistons, rotary valves for the cylinders operated continuously by the crank-shaft, a commutator having a rotatable part carried by one of the rotary valves, another part of the commutator bearing electric spring-contacts to be operated by the said rotatable part, a primary electric circuit having branches containing the spring-contacts and the primaries of induction-coils, and secondary circuits leading from the coils to igniting means in the said cylinders, as set forth.

604,242. WATER-LIFTING MACHINE. ALPHEUS J. VARNE, Grand Junction, Colo. Filed Oct. 26, 1896. Serial No. 610,290. (No model.)

Claim.—A water-lifting machine consisting of the combination of a swinging pendulum having a series of troughs in which the troughs are placed one above the other, in parallel directions and at a given angle to a horizontal plane, a second series of troughs similarly arranged, but inclined in an opposite direction at about the same angle, the troughs of one series communicating by passage-ways at their ends, with the troughs of the other series, a second set of series of

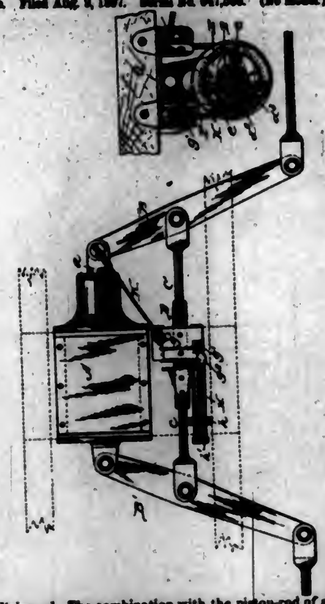
troughs located at a higher level, and communicating by a waterway, other similar sets of series of troughs, and connecting-rods between the pendulums for communicating motion from the top pendulum to the lowest, the several series of troughs being respectively on different pendulums.

604,243. DOLL. EMIL VERPILLIER and CHARLES W. GRAVES, Newark, N. J. Filed June 25, 1897. Serial No. 642,245. (No model.)

Claim.—1. A doll or the like, comprising a body, and a skeleton frame in said body, tubular portions on said frame, a ball-joint connected with each tubular portion, and members of the doll secured to said joints, whereby each member of the doll is capable of a rotary movement about its longitudinal axis, but is also capable, at the same time, of a flexible movement in any plane different to the plane of rotation, substantially as and for the purposes set forth.

2. A doll or the like, comprising a body, and a skeleton frame F in said body, tubes f^3 and f^4 at or near the top of said frame, and tubes f^5 and f^6 at or near the bottom of said frame, a ball-joint connected with each tube, and members of the doll secured to said joints, whereby each member of the doll is capable of a rotary movement about its longitudinal axis, but is also capable, at the same time, of a flexible movement in any plane different to the plane of rotation, substantially as and for the purposes set forth.

3. A doll or the like, comprising a body, and a skeleton frame F in said body, tubes f^3 and f^4 at or near the top of said frame, and tubes f^5 and f^6 at or near the bottom of said frame, a ball-joint connected with each tube, and members of the doll secured to said joints, each joint consisting of a ball portion, a pair of hinge-pieces pivotally arranged on a pin or rivet in said ball portion, and a sleeve on each hinge-piece, adapted to be respectively secured, one in a tubular portion on the frame F and the other in the hollow part of a member of the doll, whereby each member of the doll is capable of a rotary movement about its longitudinal axis, but is also capable, at the same time, of a flexible movement in any plane different to the plane of rotation, substantially as and for the purposes set forth.



4. A joint for dolls or the like, consisting, essentially, of a pair of hemispheres pivotally arranged on a pin, an arm secured to each hemisphere, said arms projecting beyond said hemispheres, and sleeves arranged on said arms, substantially as and for the purposes set forth.

5. A joint for dolls or the like, consisting, essentially, of a pair of hemispheres pivotally arranged on a pin, an arm secured to each hemisphere, said arms projecting beyond said hemispheres, a sleeve permanently fixed on one of said arms, and a sleeve rotatively arranged on the other of said arms, substantially as and for the purposes set forth.

6. A joint for dolls or the like, consisting, essentially, of a pair of hemispheres, recessed on their flat surfaces, a pin on which said hemispheres are pivotally arranged, and arms secured in the recessed portion of each hemisphere and also pivotally connected with said pin, and a sleeve on the free end of each arm, substantially as and for the purposes set forth.

7. A joint for dolls or the like, consisting, essentially, of a pair of hemispheres, recessed on their flat surfaces, a pin on which said hemispheres are pivotally arranged, arms secured in the recessed portion of each hemisphere and also pivotally connected with said pin, a sleeve permanently fixed on the free end of one of said arms, and a sleeve rotatively arranged on the free end of the other of said arms, substantially as and for the purposes set forth.

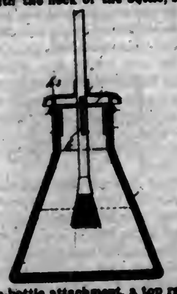
604,244. AIR-BRAKE CONTROLLER. JOHN C. WARDE, St. Louis, Mo. Filed Aug. 9, 1897. Serial No. 647,868. (No model.)

Claim.—1. The combination with the piston-rod of an air-brake cylinder and the tie-rod of a brake system, of a turnbuckle, a turnbuckle-sheave, a flexible bridle which connects the piston-rod and the turnbuckle-sheave and means for actuating the turnbuckle-sheave in a direction the reverse of that caused by the connection with the piston-rod, substantially as and for the purposes specified.

2. The combination with the piston-rod of an air-brake cylinder and the tie-rod of a brake system, of an interposed turnbuckle, turnbuckle-sheave, and a spring-retracted bridle which connects the piston-rod and turnbuckle-sheave, substantially as and for the purposes specified.

3. The combination with the piston-rod of an air-brake cylinder and the tie-rod of a brake system, of an interposed turnbuckle and turnbuckle-sheave, a bridle which connects the piston-rod and turnbuckle-sheave, and a spring with which the free end of the bridle engages, substantially as and for the purposes specified.

4. The combination with the piston-rod of an air-brake cylinder and the tie-rod of a brake system, of an interposed turnbuckle and turnbuckle-sheave, a spring-retracted bridle which connects the piston-rod and the turnbuckle-sheave, and suitable bridle-sheaves, substantially as and for the purposes specified.



5. The combination with the piston-rod of an air-brake cylinder and the tie-rod of a brake system, of a turnbuckle, a turnbuckle-sheave, a turnbuckle rest or support, means for actuating the turnbuckle-sheave from the piston-rod and means for actuating the turnbuckle-sheave in a direction the reverse of that caused by its connection with the piston-rod, substantially as and for the purposes specified.

6. The combination with the piston rod of an air-brake cylinder and the tie-rod of a brake system, of a turnbuckle, an adjustable turnbuckle support or rest, means for actuating the turnbuckle from the piston-rod and means for actuating the turnbuckle in a direction the reverse of that caused by its connection with the piston-rod, substantially as and for the purposes specified.

7. In a brake system, the combination with a tie-rod composed of threaded sections, of a turnbuckle having plain guide-chambers in advance of its threaded portion the bores of said chambers turned to afford bearings for the unthreaded portions of the tie-rod, whereby cross or wabbling motion and strain on the tie-rod sections is obviated; substantially as and for the purposes specified.

604,245. MUCILAGE-BOTTLE. MARK P. BRESNAN, New York, N. Y. Filed Sept. 3, 1897. Serial No. 650,550. (No model.)

Claim.—1. In a mucilage-bottle attachment, a top rail, downwardly-directed prongs whereby said rail may be secured in the neck of a bottle and means whereby the escape of the attachment into the bottle is prevented, said prongs being so disposed as to hold said top rail out of contact with the neck of the bottle, substantially as described.

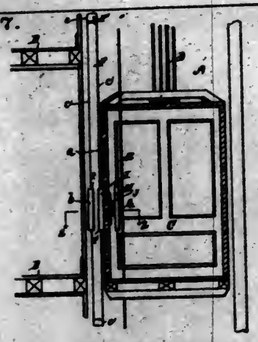
2. In a mucilage-bottle attachment, a top rail, flaring extension thereon whereby the escape of the attachment into the bottle is prevented and downwardly-directed prongs so disposed as to hold said top rail out of contact with the neck of the bottle, substantially as described.

3. In a mucilage-bottle attachment, a top rail, flaring extension thereon, whereby the escape of the attachment into the bottle is prevented, downwardly-directed prongs so disposed as to hold said top rail out of contact with the neck of the bottle and means whereby the cover of a bottle may be held out of contact with the neck, substantially as described.

4. In a mucilage-bottle attachment, a top rail, flaring extension thereon whereby the escape of the attachment into the bottle is prevented, downwardly-directed prongs so disposed as to hold said top rail out of contact with the neck of the bottle and upwardly-directed extensions whereby the cover of a bottle may be held out of contact with the neck, substantially as described.

604,246. BICYCLE-SUPPORT. JOSEPH J. DIX, St. Louis, Mo. Filed July 12, 1897. Serial No. 644,903. (No model.)

Claim.—1. In a bicycle-support, the combination with an inclined portion A, recessed at its upper end, and side walls having cut-away portions at their highest points, forming rests for the handle-bar of a bicycle, the handle-bar stem being received in the recess of the inclined support A, substantially as described.



2. In a bicycle-support, the combination with the inclined portion A, of prongs arranged on its highest end, side walls D having cut-away portions *d*, and a locking device cooperating with said prongs, substantially as described.

3. The combination with the inclined support A, of prongs B extending from the upper end of said inclined support, a notched locking device slidingly arranged between said prongs, and side walls D having cut-away portions *d*, substantially as described.

4. The combination with an inclined support A, having a slot *a* in its lower end, prongs B projecting from the upper end of said inclined support, a locking-plate C slidingly mounted between said prongs, side walls D formed with inclined faces *d*, and a tool-box, or receptacle, arranged between said side walls, substantially as described.

604,247. SAFETY-BRAKE FOR ELEVATORS. GEORGE HANCOCK, Providence, R. I. Filed Nov. 8, 1897. Serial No. 657,891. (No model.)

Claim.—The combination of the elevator-car, with the clamping-track F, F, arranged outside of the car, the clamping-bolt G provided with the head *b*, adapted to bear against the outer edges of the track, the hand-operated nut H within the car, and the friction-plate I interposed between the inner edges of the track and the side of the car, substantially as described.

604,248. PUNZLE. FRANK D. HOPLEY, New York, N. Y. Filed July 3, 1897. Serial No. 643,242. (No model.)

Claim.—1. A puzzle consisting of a surface provided with marked positions of two distinguished groups arrayed oppositely to each other and connected by similar positions in two places and a number of chips divided into two distinguished groups and marked correspondingly to the positions, adapted to be placed thereon, all for the purpose of a puzzle, substantially as shown and described.

2. The combination of a field with eighteen positions marked thereon, divided into two groups of seven each, and connected with each other by the four remaining positions, a number of disks belonging to one of two groups, matching the markings of the positions, all for the purpose of placing the disks upon the positions and transferring them through skilful planning over the connecting positions unto the positions of the opposite group, substantially as shown and described.

3. A puzzle, consisting of a box, whereon a number of spots, lined to one another are oppositely arrayed in two groups, the second spot from either end of the line connected by other spots with the same spot of the other group, a number of men to cover the positions in line, all for the purpose of moving the men of one group upon the positions of the other group, using only as a place of access the connecting-spots, substantially as shown.

4. A puzzle combination and arrangement, consisting of a box, a cover, seven spots, marked 1, 2, 3, 4, 5, 6, 7 in rotation along one side of the box, the same number of spots opposite thereof, marked likewise but of a different color or form, two spots connecting these two groups each between the second and sixth spot, fourteen chips to match the fourteen spots, all for the purpose of placing them thereon and to endeavor their transfer to another neighboring and unoccupied spot until one group consecutively occupies the spots formerly opposite, substantially as shown and described.

5. A puzzle having two rows of positions, distinguished by color from each other, and disks to match the positions in color, and marked by consecutive numerals, the same number of disks in each group, free, unoccupied positions between the groups for operation, over which the disks are to be moved and placed in consecutive numbers upon the positions of the opposite group, substantially as shown and described.

604,249. FEED-WATER HEATER. CHARLES J. JARMEN, Erie, Pa. Filed Dec. 11, 1896. Serial No. 615,949. (No model.)

Claim.—1. The combination, in a water-heater, of several rows of tubes terminating at top and bottom in tube-plates, a base on which the bottom tube-plate rests containing passages connecting the bottoms of the tubes of one central row to the bottoms of the tubes of an adjoining row, a cap on the tops of the tubes also having passages and connecting the tops of the tubes in the second row with those of a third row, and so on for other rows until the outer rows are reached, water inlet and outlet passages, one communicating with a central

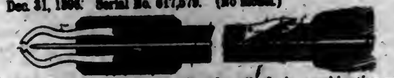
row of the tubes and the other with an outer row, and an inclosing steam-chamber.

2. The combination, in a water-heater, of groups of tubes connected in series, the connection at the bottom being by curved passages cast in the base and extending transversely to openings at one side, a removable plate normally covering said openings, and a steam-chamber inclosing the tubes.

3. The combination, in a water-heater, of groups of tubes the groups being connected in series by detachable curved passages at top and bottom, the passages at the bottom having normally-closed clearing-openings and a removable cover therefor.

4. The combination, in a water-heater, of groups of tubes the groups being connected in series by passages at top and bottom, the passages at the bottom having blowing-out connections whereby the passages and connected rows of tubes can be drained or blown out separately.

5. The combination, in a water-heater having a water inlet and outlet and a steam-chamber, of rows of tubes connected in series by suitable passages, a scum-chamber over the connecting-passage of the last row of tubes, and one or more openings from said passage to the scum-chamber.



6. The combination, in a water-heater having a water inlet and outlet and a steam-chamber, of tubes suitably connected at the bottom, a tube-plate in which the tubes terminate at the top, a cap having curved passages for connecting the tubes at the top, and a scum-chamber connected with the outer passage.

7. The combination, in a water-heater, of tubes terminating at the top in a tube-plate, a cap having curved passages for connecting the tubes, a scum-chamber over the last passage, there being one or more openings from said last passage to the scum-chamber, a lip or lips below the openings for diverting scum into the scum-chamber, and a steam-chamber.

8. The combination, in a water-heater having water inlet and outlet, and a steam-chamber, of rows of tubes connected in series by passages, the rows of tubes and the passages being of greater capacity than the outlet of the heater, the passage to the last row of tubes at its outer end being contracted between the water-outlet and the opening into the scum-chamber so as to make it about equal in capacity to the water-outlet, as specified, whereby scum is more perfectly diverted to the scum-chamber, and said scum-chamber.

9. The combination, in a water-heater having a water inlet and outlet and a steam-chamber, of rows of tubes connected in series by suitable passages, a scum-chamber over the connecting-passage of the last row of tubes, and one or more openings from said passage to the scum-chamber, and a blow-out pipe connected to the scum-chamber.

604,250. SCREW DRIVER AND DRAWER. GEORGE B. JOCELYN, Arthur, Ill., assignor of one-half to Hugh F. Kirk, same place. Filed Dec. 31, 1896. Serial No. 617,579. (No model.)

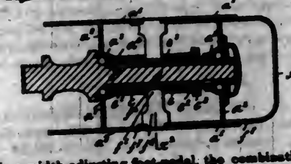
Claim.—1. In a tool of the class described, the combination with a suitable handle provided with a bore, of a plurality of clamping-jaws hinged to said handle and adapted to retain therein a screw or the like for inserting or extracting the same, a driving-blade disposed in the bore of the handle, means for retaining said blade in said bore at different points throughout the length thereof, and means for compressing the jaws to retain the screw or the like therein, substantially as set forth.

2. In a tool of the class described, the combination with a suitable handle provided with a bore, of a plurality of oppositely-disposed clamping-jaws hinged to said handle and adapted to retain therein a screw or the like for inserting or extracting the same, a driving-blade disposed in the bore of the handle, a pawl for retaining said blade in said bore, and means for compressing the jaws to retain the screw or the like therein, substantially as set forth.

3. In a tool of the class described, the combination with a suitable handle provided with a bore, of a plurality of oppositely-disposed clamping-jaws hinged to said handle and adapted to retain therein a screw or the like for inserting or extracting the same, a driving-blade disposed in the bore of the handle, a pawl for retaining said blade in said bore, and a collar mounted on the handle and adapted to compress the jaws to retain the screw or the like therein, substantially as set forth.

4. In a tool of the class described, the combination with a suitable handle provided with a bore and having a series of screw-threads, of a plurality of clamping-jaws hinged to said handle and adapted to retain therein a screw or the like for inserting or extracting the same, a driving-blade disposed in the bore of the handle, means for retaining said blade in said bore, and a collar mounted on the threads of the handle and adapted to compress the jaws to retain therein the screw or the like, substantially as set forth.

5. In a tool of the class described, the combination with a suitable handle provided with a bore, of a plurality of clamping-jaws carried by said handle, said jaws being provided in their outer ends with notches adapted to receive a screw or the like for retaining the same in said jaws when inserting or extracting, said jaws being further provided with offsets, a driving-blade disposed within the bore of the handle and adjustable therein, means for retaining said blade at different points throughout said bore, and a collar mounted upon the handle and having its inner face concaved longitudinally, the concaved inner face of the collar being adapted to contact with the offsets of the jaws for compressing the latter to retain therein a screw or the like, substantially as described.



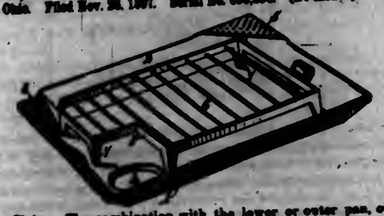
6. In a tool of the class described, the combination with a suitable handle provided with a bore and also having a series of screw-threads, of a plurality of clamping-jaws hinged to said handle, said jaws being provided in their outer ends with notches adapted to receive a screw or the like for retaining the screw in the jaws, said jaws being further provided with offsets, a driving-blade disposed in the bore of the handle, means for retaining said driving-blade at different points in said bore, a collar mounted upon the threads of the handle and provided with a longitudinal concaved inner face, the concaved inner face of said handle being adapted to contact with the offsets of the clamping-jaws to compress the latter, and means for expanding said jaws when pressure thereon is removed, substantially as set forth.

7. In a tool of the class described, the combination with a suitable handle provided with a bore and also having a series of screw-threads, of a plurality of clamping-jaws hinged to said handle, said jaws being provided in their outer ends with notches adapted to receive a screw or the like for retaining the screw in the jaws, said jaws being further provided with offsets, a driving-blade disposed in the bore of the handle, and having one of its sides provided with a series of serrations, a pawl pivoted in one side of the handle and adapted to engage the serrations of the driving-blade for retaining the latter at different points in said bore, a collar mounted upon the threads of the handle and provided with a longitudinal concaved inner face, the concaved inner face of said handle being adapted to contact with the offsets of the clamping-jaws to compress the latter, and means for expanding said jaws when pressure thereon is removed, substantially as set forth.

8. In a tool of the class described, the combination with a suitable handle provided with a bore and also having a series of screw-threads, said handle being further provided in one of its sides with an opening, of a plurality of clamping-jaws hinged to said handle, said jaws being provided in their outer ends with notches adapted to receive a screw or the like for retaining the screw in the jaws, said jaws being further provided with offsets, a driving-blade disposed in the bore of the handle and having one of its sides provided with a series of serrations, a pawl pivoted in the opening of the handle, a spring connected to said pawl and seated in a depression formed in the handle adjacent to the opening thereof, said pawl being adapted to engage the serrations of the driving-blade to retain the latter at different points in the bore of the handle, a collar mounted upon the threads of the handle and provided with a longitudinal concaved inner face, the concaved inner face of said handle being adapted to contact with the offsets of the clamping-jaws to compress the latter, and means for expanding said jaws when pressure thereon is removed, substantially as set forth.

604,251. CYCLE-PEDAL. WILLIAM A. LLOYD and HENRY KEELING, Birmingham, England. Filed Dec. 29, 1897. Serial No. 664,295. (No model.) Patented in England Sept. 11, 1897, No. 20,891.

Claim.—1. In a width-adjusting foot-pedal, the combination with a stationary frame, of an externally-threaded waist or barrel mounted to rotate in bearings in said frame, a movable frame sliding upon the stationary frame and having lateral projections which have a threaded connection with the waist or barrel, means for guiding the free ends of said projections and a nut on the waist or barrel for rotating the latter to adjust the movable frame upon the stationary frame.

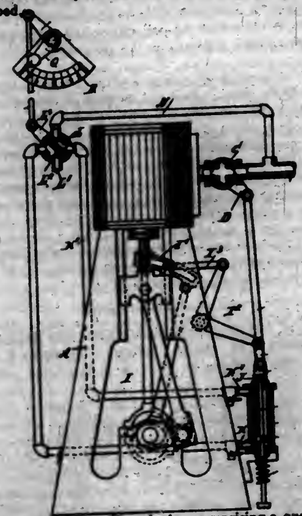


2. In a width-adjusting foot-pedal, the combination with a stationary frame carrying a pair of cup-bearings, of an externally-threaded waist or barrel mounted to rotate in said cup-bearings, a movable frame sliding upon the stationary frame and having threaded shanks which engage the threaded surface of the waist or barrel, and a milled nut fixed to the said waist or barrel for the purpose specified.

3. In a width-adjusting foot-pedal, the combination with a stationary frame carrying a pair of cup-bearings, of an externally-threaded waist or barrel mounted to rotate in said bearings, a slotted sleeve fixed to the frame and surrounding said waist or barrel, a movable frame sliding upon the stationary frame and having threaded shanks which pass through the slots in the sleeve and have their threaded portions in engagement with the threads of the waist or barrel, and a milled nut or head on the said waist or barrel, for the purpose specified.

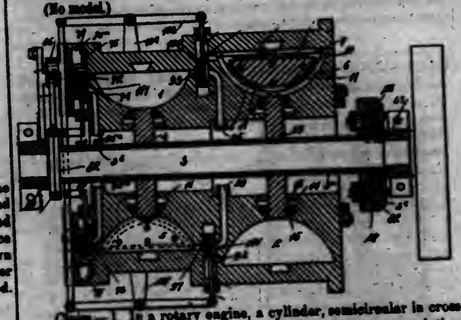
4. In a width-adjusting foot-pedal, the combination with a stationary frame having guide-slots in the opposite sides thereof, and end plates a^3, connecting the sides of said frame of a cup-bearing a^2, fixed to each end plate; an externally-threaded waist or barrel c, mounted to rotate in said cup-bearings, a milled nut c^1, at one end of the waist or barrel, a slotted sleeve c, surrounding said waist or barrel and secured at one end to one of the cup-bearings, a movable U-shaped frame b, having guide-studs f^7, at its ends which move in the guide-slots of the stationary frame, and oppositely-disposed threaded shanks f^8 fixed to the said movable frame, said shanks passing freely through the slots in the sleeve and having their threaded portions in operative engagement with the threads on the waist or barrel as and for the purpose described.

604,252. ROASTING-PAN. EDWARD S. LORENSEN, Manchester, Conn. Filed Nov. 26, 1897. Serial No. 659,599. (No model.)



Claim.—The combination with the lower or outer pan, of the inner or upper pan having a corner beveled off or drawn inward, and a grid arranged in the inner pan, the said inner pan being supported in the outer pan at the edges of said pans and with a water-space between the two pans, whereby the beveled-off or inwardly-drawn corner of the inner pan will afford a passage for introducing water into the outer pan and for escape of steam, substantially as described.

604,253. ENGINE-CONTROLLING DEVICE. ALEXANDER P. LOPER, Stonington, Conn. Filed Sept. 9, 1897. Serial No. 651,104. (No model.)



Claim.—1. In an engine-controlling device the combination with the throttle-valve and the reversing-gear of an auxiliary cylinder containing a piston normally in a middle position in the cylinder, the piston being connected with the said throttle-valve and the said reversing-gear, a valve connected with a fluid-pressure supply and with the ends of the said auxiliary cylinder to admit a fluid under pressure to either end of the said cylinder to shift the piston therein, and means under the control of the operator for shifting the said valve and indicating the position thereof, substantially as described.

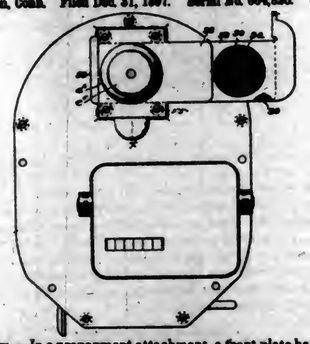
2. An engine-controlling device, comprising an auxiliary cylinder containing a piston connected with a throttle-valve and with the reversing-gear of the engine, for actuating both simultaneously, a valve directly under the control of the operator, and connected with a supply and with both ends of the said auxiliary cylinder, and springs connected with the piston-rod of the auxiliary cylinder, to hold the piston thereof normally in a middle position, substantially as shown and described.

3. An engine-controlling device, comprising a quadrant having a pointer, a valve having its plug positively connected with the said pointer, the valve being connected with a steam-supply and with an exhaust, an auxiliary cylinder connected at its ends with the said valve, to permit of sending steam from the valve to either end of the cylinder, a piston contained in the said cylinder, and having its piston-rod pressed on by springs, to normally hold the piston in a middle position, and means for connecting the piston-rod of the said piston with the throttle-valve of the engine and with the reversing mechanism thereof, as set forth.

604,254. ROTARY ENGINE. THOMAS C. LOUD, Richmond, Mass., assignor to himself and J. Harry Orr, New Lebanon, and Theodore W. Harris, New York, N. Y. Filed Sept. 24, 1897. Serial No. 653,210. (No model.)

Claim.—1. In a rotary engine, a cylinder, semicircular in cross-section, a slide-valve for governing admission of steam, a regulating-valve movable with and adjustable relatively to the slide-valve, an abutment movable in the cylinder, a semicircular piston in the cylinder, comprising a center block and side pieces, segmental packing-strips between the side pieces and adapted to engage against the sides of the cylinder, springs for forcing the segmental packing strips outward, a packing-strip made in two sections and arranged between the side pieces at the end of the piston, a spring exerting longitudinal pressure on said sections, and a spring for forcing the sections outward, substantially as specified.

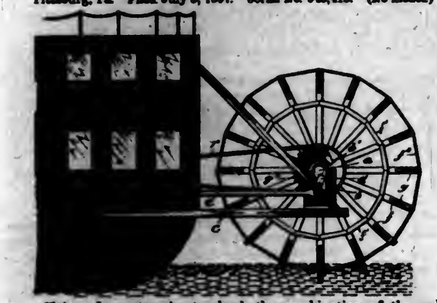
2. In a rotary engine, a cylinder, abutments mounted to swing into recesses formed in the wall of the cylinder, the said abutments being ribbed on the under side, stop-lugs extended from the wall of the cylinder and against the sides of which the ends of the abutments are designed to engage and prevent the entrance of steam rearward of inactive abutments, and a rotary piston in the cylinder, substantially as specified.



3. A rotary engine, comprising a cylinder, a driving-shaft, a piston carried by the driving shaft and movable in the cylinder, opposite slide-valves for governing ports leading into the cylinder, regulating-valves movable with the slide-valves, and means for adjusting the regulating-valves relatively to the slide-valves, substantially as specified.

4. A rotary engine, comprising a cylinder, a driving-shaft, a piston carried by the driving-shaft and movable in the cylinder, opposite slide-valves for governing the ports leading into the cylinder, regulating-valves, plates extended from the regulating-valves to projections on the slide-valves, said plates having hook ends, wedge-blocks movable between said hook ends and the first projection, and levers for moving said wedge-blocks, substantially as specified.

5. In a rotary engine, a cylinder, a power-shaft extended through the cylinder, a sleeve mounted to rotate on the shaft, a piston attached to the sleeve, an eccentric on the sleeve, abutments in the cylinder and operated from the eccentric, and means for securing the sleeve as rotatively adjusted to compensate for wear of the shaft due to side thrusts, substantially as specified



---

604,255. PREPAYMENT ATTACHMENT FOR METERS. CHAS LOEB, Milford, Conn., assignor to Henry G. Thompson & Son, New Haven, Conn. Filed Dec. 31, 1897. Serial No. 664,220. (No model.)

Claim.—In a prepayment attachment, a front plate having a coin-chamber, a coin-carrier, a detachable table fitted to said front plate, a cap fixed to said front plate, and a coin-feeder having a through-and-through opening and fitted to slide snugly between said table and said cap, and means to remove a coin from said feeder into said coin-carrier, substantially as described.

604,256. STEAMBOAT PADDLE-WHEEL. LOUIUS O. C. MAGEE, Pittsburg, Pa. Filed July 3, 1897. Serial No. 643,413. (No model.)

Claim.—In a steamboat-wheel, the combination of the axle mounted upon suitable bearings, a crank secured to said axle outside of the bearings, driving-rods connected to said cranks, paddle-spokes secured in the axle and provided near their outer and inner ends with elongated slots, a wheel mounted on the shaft and provided with parallel-centrical grooves, paddles slidably mounted in the longitudinal slots near the outer ends, a bar mounted in the slots near the axle, and provided with an extension engaging the parallel-centrical groove, said bar being secured to the paddle by means of braces or arms, said wheel provided on its outer periphery with teeth adapted to engage a sprocket-chain whereby the position of the groove may be changed to simultaneously change the operation of the paddles, substantially as shown and described.

604,257. CIGARETTE-WRAPPER. CARL H. MEISSER, Berlin, Germany, assignor of one-half to Alonzo H. Sylvester, same place. Filed May 10, 1897. Serial No. 636,023. (No model.) Patented in Germany Nov. 23, 1894, No. 82,904; in England Dec. 7, 1894, No. 22,333; in Belgium Jan. 16, 1895, No. 112,686, and in France Nov. 30, 1895, No. 252,164.

Claim.—A cigarette or cigar wrapper, consisting of a thin metal film, coated with a suitable isoeneous substance, that will induce such an action of capillarity with the metal, as to prevent the transformation of the melted film into big drops, as and for the purpose set forth.

604,258. APPARATUS FOR JOINING TELEGRAPH-CABLES. HENRI MEISER, Paris, France. Filed Dec. 28, 1897. Serial No. 664,022. (No model.) Patented in France May 11, 1897, No. 264,268.

Claim.—1. The apparatus above described for completing telegraphic cable-joints, comprising an elastic cylinder to inclose the cable-joint, hollow chambers about the cylinder and means for admitting fluid-pressure to the chambers to compress the cable-joint, substantially as described.

2. The apparatus above described which consists in the combination of a metal box or case in two parts with hollow elastic inclosures between which is placed the joint to be operated upon, and in which the compression takes place, as and for the purposes described.

3. The apparatus above described, comprising a metal box or case in two parts, elastic pieces inclosed therein, means for fastening the parts of the case together, and means for admitting fluid to the interior when jointed, substantially as described.

4. The apparatus above described, comprising a box or case in two parts, means for uniting them together, and hollow elastic inclosures with thickened ends and means for admitting fluid-pressure to the hollow elastic inclosures, as and for the purpose described.

604,259. BOTTLE-STOPPER. EDWARD A. PARKER, Meriden, Conn., assignor of one-half to William I. Healey, New York, N. Y. Filed June 3, 1897. Serial No. 638,536. (No model.)

Claim.—1. In combination a central tube having at its lower end a disk and at its upper end a screw-thread, a disk free to slide on said tube, a plug between said disks and a faucet having a body separate from the central tube and internally threaded to engage the thread on the tube whereby the disks are moved toward each other and the plug is expanded transversely.

2. In combination a central tube having at its lower end a disk and at its upper end flattened portions 4 and a screw-thread, a disk free to slide on said tube and held against rotation by said flattened portions, a plug between said disks and a faucet-body separate from the central tube and internally threaded to engage the thread on the central tube whereby the disks are moved toward each other and the plug is expanded transversely.

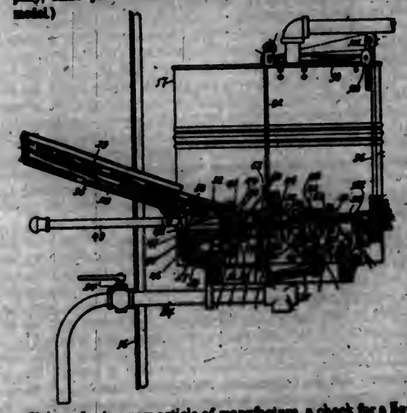
604,260. STAKE FOR PLANTS, FLOWERS, OR TREES. THERON H. PARKER, Brooklyn, N. Y., assignor of one-half to Peter Igoe and Andrew Igoe, same place. Filed May 5, 1897. Serial No. 635,172. (No model.)

Claim.—1. A stake comprising an upper member having a leg and a lower or supporting member on which the upper member is vertically adjustable, the engaging parts comprising a lateral hook at the lower end of the said leg, the said upper member binding on the lower member at the hook end and at a point on the upper member above the hook when the parts are sprung into adjusted position, substantially as described.

2. A stake made in sections, each formed with a leg terminating in an eye, and a rim part extending from the eye approximately at right angles to the leg, the free end of the rim part being formed with a pin adapted to engage the eye of the adjacent section, substantially as shown and described.

3. A stake made in sections forming legs and a sectional rim, of which the rim parts are detachably connected with each other, substantially as shown and described.

4. A stake made in tiers vertically adjustable one on the other, each tier being made in sections consisting of a leg terminating in an eye, and a rim part extending from the eye and formed with a pin adapted to engage the eye of the adjacent section, the extension tiers having their legs formed with hooks adapted to engage the legs of the preceding tier, substantially as shown and described.



5. A stake provided with an extension-tier made in sections, each formed with a leg terminating at one end in a hook and at its other end in an eye, a rim part extending from the eye approximately at right angles to the leg, and a pin formed on the free end of the said rim part to engage the eye of the adjacent section, substantially as described.

6. A stake made in tiers adjustable one on the other, and each formed with legs and a rim, the legs of the extension-tier being adapted to engage the rim of the preceding tier and the inside of the corresponding legs, the lower ends of the legs of the extension-tiers being formed with hooks adapted to engage the outside of the corresponding leg of the preceding tier, substantially as shown and described.

7. A stake made in sections forming legs and a sectional rim having its rim parts pivotally connected with each other, substantially as described.

8. A stake provided with an extension-tier made in sections forming legs and a sectional rim, the rim parts being detachably connected with each other and the legs being formed with hooks, substantially as described.

604,261. MILK MEASURING AND DISCHARGING MACHINE. WILLIAM H. PERRY, Lake Mills, Wis., assignor to the F. E. Fargo & Company, same place. Filed June 5, 1897. Serial No. 639,202. (No model.)

Claim.—1. As a new article of manufacture, a check for a liquid-measuring machine, consisting of a split ring having a peripheral shoulder.

2. As a new article of manufacture, a check for liquid-measuring machine, consisting of a split ring, having on one face a projecting lug, said lug being on the plane of a line drawn vertically and centrally through the opening of the ring.

3. As a new article of manufacture, a check for a liquid-measuring machine, consisting of a split ring having a peripheral shoulder, and said ring also having on one face a projecting lug.

4. In a liquid-measuring machine, the combination, with a box or casing provided with a slot having an enlargement at one point, and a runway arranged longitudinally therein, and consisting of a beam having its upper edge free from contact with the top of the box or casing, and provided on opposite sides with longitudinal shoulders, said shoulders terminating short of the upper end of the runway.

5. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism adapted to operate in conjunction with a mechanism-controlling check, for seating and unseating the valves, whereby, when the inlet is opened and the outlet closed, a certain measured quantity of the liquid corresponding to an index on the check is permitted to enter the casing, and, when the inlet is closed and the outlet opened, the measured quantity of liquid is automatically discharged, and a pusher-rod adapted, when pushed inwardly, to act on the mechanism-controlling check so as to force said check into position to operate on the valve-controlling mechanism to open the inlet and close the outlet, said check, during the time the pusher-rod is held inwardly, and after a predetermined quantity of fluid has entered the casing through the inlet, adapted to be acted on by the valve-operating mechanism, so as to cause the closing of the inlet and the opening of the outlet.

6. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, a float within the casing adapted, when the inlet is opened and the outlet closed, to be raised as the liquid passes into the casing, and, when the inlet is closed and the outlet opened, to be lowered as the liquid discharges from the casing, a shaft, valve-operating mechanism, mechanism carried by the shaft for operating on the valve-operating mechanism, mechanism between the float and the shaft for rotating said shaft in opposite directions, and means for operating the mechanism carried by the shaft, whereby when said mechanism is operated in one direction the inlet-valve is opened and the float caused to ascend by the inflowing liquid, said ascent causing the rocking of the shaft in one direction, whereby the mechanism carried by said shaft and which is adapted to act on the valve-operating mechanism will, after a certain quantity of liquid has entered the casing, act on said valve-operating mechanism so as to cause a closing of the inlet and an opening of the outlet for the discharge of the contents of the casing and the descent of the float, which descent of the float will cause the rocking of the shaft in the opposite direction, and the mechanism carried by said shaft to be returned to a position to again act on the valve-operating mechanism.

7. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and outlet openings, valve-operating mechanism, a sliding and rotative part, means for sliding the sliding and rotative part, whereby, when said longitudinally in one direction, it will actuate the valve mechanism to cause an unseating of the inlet-valve, and means for giving a partial rotation to said sliding and rotative part, to cause, after a certain quantity of liquid has been admitted to the casing, a seating of the inlet-valve and an unseating of the outlet-valve, and means for returning the sliding and rotative part to its normal rotative and longitudinal positions.

8. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and outlet openings, valve-operating mechanism, a sliding and rotative part adapted to be engaged by a mechanism-controlling check, said check adapted to act on the sliding and rotative part, to cause the sliding of said part in one direction, whereby it is caused to actuate the valve mechanism in a manner to unseat the inlet-valve, and said mechanism-controlling check adapted, at this time, to give a partial rotation to said sliding and rotative part, to cause, after a certain amount of liquid has been admitted to the casing, the seating of the inlet-valve and the unseating of the outlet-valve, and means adapted for returning the sliding and rotative part to its normal rotative and longitudinal positions.

9. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and outlet openings, valve-operating mechanism, a sliding and rotative part adapted to be engaged by a mechanism-controlling check, said check adapted to act on the sliding and rotative part to cause the sliding of said part in one direction, whereby it is caused to actuate the valve mechanism, which mechanism under such actuation unseats the inlet-valve, and said mechanism-controlling check adapted, at this time, to give a partial rotation to said sliding and rotative part, to cause, after a certain amount of liquid has been admitted to the casing, the seating of the inlet-valve and the unseating of the outlet-valve, and means

adapted for returning the sliding and rotative part to its normal rotative and longitudinal positions, and for ejecting the mechanism-controlling check simultaneously with the return of the sliding and rotative part to its normal longitudinal position.

10. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and outlet openings, valve-operating mechanism, a float within the casing, an operating-shaft, mechanism between the shaft and the float, a sliding and rotative part on the shaft, mechanism adapted to act on the sliding and rotative part to cause the sliding of said part in one direction, whereby it will actuate the valve mechanism and cause an unseating of the inlet-valve to admit the liquid into the casing and cause the ascent of the float, said ascent of the float, through the mechanism between the float and the shaft, causing a partial rotation of said shaft and a consequent partial rotation of the sliding and rotative part, which partial rotation of the sliding and rotative part will, after a certain quantity of the liquid has been admitted to the casing, cause a seating of the inlet-valve and an unseating of the outlet-valve, for the outflow of the liquid and the consequent descent of the float, said descent of the float causing the shaft to be rotated in the opposite direction, and the sliding and rotative part to be rotated therewith and thereby returned to its normal rotative position, and means for causing the sliding and rotative part to be returned to its normal longitudinal position.

11. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a float within the casing, an operating-shaft having a winch mounted thereon, a chain fast at one point to the float, and thence passing around a pulley mounted in the bottom of the casing, and thence upwardly over other pulleys, and finally fastened at its ends to the winch, a slidable and rotative part on the shaft, mechanism adapted to act on the slidable and rotative part to cause the sliding of said part in one direction to actuate the valve mechanism and cause the unseating of the inlet-valve to admit the liquid into the casing and also cause the ascent of the float, said ascent of the float, through the chain connection, causing a partial rotation of the shaft and a consequent partial rotation of the slidable and rotative part, which partial rotation of said part will, after a certain quantity of the liquid has been admitted to the casing, cause a seating of the inlet-valve and an unseating of the outlet-valve for the discharge of the liquid and the consequent descent of the float, said descent of the float through another chain connection causing the rotation of the shaft in the opposite direction, and the slidable and rotative part to be rotated therewith, and thereby returned to its normal rotative position, and means for causing the sliding and rotative part to be returned to its normal longitudinal position.

12. In a liquid measuring and discharging machine, the combination, of a casing having an inlet and a discharge opening, a pivoted lever, a valve-rod suspended freely through an eye in the short arm of the lever, and carrying at its lower end a valve adapted to close and open the outlet-opening, another valve-rod pivoted medially to the long arm of the lever, and carrying at its lower end a valve adapted to close and open the inlet-opening, and an operating rod connected to the lever and adapted to turn the same in opposite directions on its pivot.

13. In a liquid measuring and discharging machine, the combination, of a casing having an inlet and a discharge opening, a pivoted lever, a valve-rod suspended freely through an eye in the short arm of the lever, and carrying at its lower end a valve adapted to close and open the outlet-opening, another valve-rod pivoted medially to the long arm of the lever and carrying at its lower end a valve adapted to close and open the inlet-opening, a rod connected to the lever, a bell-crank lever to one arm of which the rod is adapted to be connected, and means for operating on the bell-crank lever to turn the same on its pivot.

14. In a liquid measuring and discharging machine, the combination, of a casing having inlet and discharge openings, valve-operating mechanism, a float within the casing, an operating-shaft, a winch rotative with the shaft, but constructed to be removed therefrom to adapt another winch of varying diameter to be substituted therefor, whereby the percentage of liquid discharged is regulated, a chain fast at one point to the float, and thence passing around a pulley mounted in the bottom of a casing, and thence upwardly over other pulleys, and finally fastened at its ends to the winch, a slidable and rotative part on the shaft, mechanism adapted to act on the slidable and rotative part, to cause the sliding of said part in one direction whereby the valve mechanism is caused to be actuated and the inlet-valve unseated to admit the liquid into the casing and the float also caused to ascend, said ascent of the float, through the chain connection, causing a partial rotation of the shaft and a consequent partial rotation of the slidable and rotative part, which partial rotation of the slidable and rotative part will, after a certain quantity of the liquid has been admitted to the casing, cause a seating of the inlet-valve, and an unseating of the outlet-valve for the discharge of the liquid and a consequent descent of the float, said descent of the float, through another chain connection, causing the rotation of the shaft in the opposite direction, and the slidable and rotative part to be rotated therewith and thereby returned to its normal rotative position, and means for returning the slidable and rotative part to its normal longitudinal position.

15. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a slidable and rotative part, a pusher-rod adapted to slide said slidable and rotative part both inwardly and outwardly, said rod on its inthrust adapted to slide the slidable and rotative part to cause said part to actuate the valve mechanism and thereby unseat the inlet-valve, means for giving a partial rotation to said slidable and rotative part to cause, after a certain quantity of liquid has been admitted to the casing, a seating of the inlet-valve and an unseating of the outlet-valve, and means for returning the slidable part to its normal rotative position, whereby the slidable and rotative part can be returned to its normal longitudinal position upon the outpulling of the pusher-rod.

16. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a slidable and rotative part adapted to be engaged by a mechanism-controlling check, said check adapted to bear against the slidable part, and to slide said part inwardly so as to actuate the valve mechanism and thereby unseat the inlet-valve, means for giving a partial rotation to said slidable and rotative part to cause, after a certain quantity of liquid has been admitted to the casing, a seating of the inlet-valve and an unseating of the outlet-valve, and which means are controlled by the check, so that the inflow into the casing ceases as soon as the quantity indicated on the check is admitted to the casing, means acting in a manner to return the slidable and rotative part to its normal rotative position, and means for returning the slidable and rotative part to its normal longitudinal position.

17. In a liquid measuring and discharging machine, the combination, of a casing having valve controlled inlet and discharge openings, valve-operating mechanism, a slidable and rotative part, adapted to be engaged by a mechanism-controlling check, a pusher-rod adapted to act on its inthrust to force the check into proper position and to cause said check to bear against the slidable part and to slide said part inwardly so as to actuate the valve mechanism and thereby unseat the inlet-valve, means for giving a partial rotation to said slidable and rotative part to cause, after a certain quantity of the liquid has been admitted to the casing, a seating of the inlet-valve and an unseating of the outlet-valve, and which means are controlled by the check, so that the inflow into the casing ceases as soon as the quantity indicated on the check is admitted to the casing, and means acting in a manner to return the slidable and rotative part to its normal rotative position, in position to be returned to its normal longitudinal position by the outpulling of the pusher-rod.

18. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a bell-crank lever adapted to act on said valve operating mechanism, a slidable and rotative part adapted to be engaged by a mechanism-controlling check, a pusher-bar adapted to act on its inthrust to force the check into proper position to cause said check to bear against the slidable part and to slide said part inwardly so as to cause the arm of said sliding part to act on the bell-crank lever, and thereby unseat the inlet-valve, means for giving a partial rotation to said slidable and rotative part, so as to release the arm thereof from engagement with the bell-crank lever, and thereby cause, after a certain quantity of the liquid has been admitted to the casing, a seating of the inlet-valve and an unseating of the outlet-valve, and which means are controlled by the check, so that the inflow into the casing ceases as soon as the quantity indicated on the check is admitted to the casing, and means acting in a manner to return the slidable and rotative part to its normal rotative position, and in position so that the arm thereof may be acted upon by the end of the pusher-rod so as to return the slidable and rotative part to its normal longitudinal position.

19. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a slidable and rotative part, a dog or pawl pivoted thereto, and adapted to be engaged by a mechanism-controlling check provided with a peripheral shoulder, said check adapted to bear against the slidable and rotative part and slide said part inwardly so as to actuate the valve mechanism and thereby unseat the inlet-valve, means for giving a partial rotation to the mechanism-controlling check, whereby its shoulder is brought into engagement with the dog and the slidable and rotative part, thereby giving a partial rotation, to cause, after a certain quantity of the liquid has been admitted to the casing, said quantity corresponding to the quantity indicated on the check, a seating of the inlet-valve and an unseating of the outlet-valve, means for causing a return of the check to its normal rotative position, and means for retrieving the slidable and rotative part to its normal rotative position and to its normal longitudinal position.

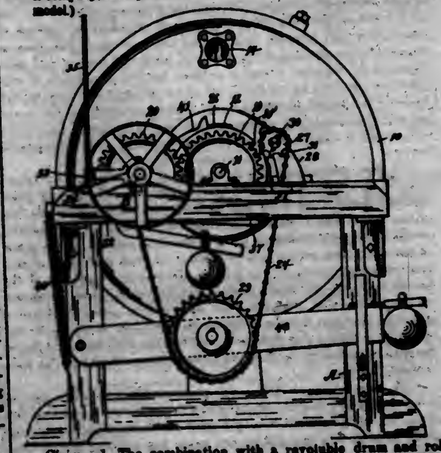
20. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a pusher-rod, a slidable and rotative part adapted to be engaged by a mechanism-controlling check, said slidable and rotative part formed with a sleeve portion having a bore of less diameter than the diameter of the check, but of sufficient diameter to permit the engaging part of the pusher-rod to enter therein when the check is not against the sleeve portion of the sliding and rotative part, said check, when against the sleeve of the slidable and rotative part, adapted to be acted upon by the pusher-rod, whereby the slidable part is moved inwardly to actuate the valve mechanism and thereby unseat the inlet-valve, means for giving a partial rotation to said slidable and rotative part to cause, after a certain quantity of the liquid has been admitted to the casing, a seating of the inlet-valve and an unseating of the outlet-valve, and which means are controlled by the check, so that the inflow into the casing ceases as soon as the quantity indicated on the check is admitted to the casing, means acting in a manner to return the slidable and rotative part to its normal rotative position, in position to be returned to its normal longitudinal position by the outpulling of the pusher-rod.

21. In a liquid measuring and discharging device, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a pivoted bell-crank lever, one arm thereof adapted to carry a mechanism-controlling check-lever, and a pusher-rod adapted, on its inthrust, to act on the bell-crank lever to cause said bell-crank lever to bring the mechanism-controlling check to a position to act on the valve-operating mechanism.

22. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings valve-operating mechanism, a pivoted bell-crank lever having one member provided with a projecting arm, said arm formed with a leg and its other member adapted to carry a mechanism-controlling check, a dog pivoted to said arm and having its free end normally resting on the leg, and a pusher-rod provided with a projecting pin, said pin on the outpull of the rod adapted to pass between the dog and the leg, and on the instroke of the rod adapted to act on the upper edge of the dog, whereby the lever is tilted so as to bring the mechanism-controlling check to a position to act on the valve-operating mechanism.

23. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a pivoted bell-crank lever, means for normally holding said lever in a position to cause its upper arm to be at an incline, said upper arm adapted to carry a mechanism-controlling check, and a pusher-rod provided with a projecting cylinder having a slotted upper portion, said pusher-rod adapted on its inthrust to act on the bell-crank lever to cause said bell-crank lever to be turned so that its upper arm will pass into the cylinder, and the inner end of said arm, projecting through the cylinder and which carries the check, to be in position to cause said check to act on the valve-operating mechanism.

24. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a runway consisting of an inclined beam having longitudinal shoulders on opposite sides, a pivoted bell-crank lever adapted to be normally turned on its pivot so that its upper arm will be at an incline adjacent to the lower end of the runway, said arm provided upon opposite sides with ears or lugs, and said arm adapted to carry a mechanism-controlling check consisting of a split ring adapted to straddle the runway and to be locked beneath the shoulders thereof, and to pass down to the bell-crank lever and to straddle the tilted arm thereof and to be locked beneath the ears or lugs on opposite sides of said arm of the bell-crank lever, and means for turning the bell-crank lever so as to throw its upper arm to a horizontal position in order to bring the mechanism controlling check to a position to act on the valve-operating mechanism.



25. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a pusher-bar adapted on its inthrust to act on the valve-operating mechanism so as to open the inlet and allow a certain quantity of liquid to pass into the casing, other mechanism acting on the valve-operating mechanism to close the inlet-opening and open the outlet-opening, after a certain quantity of liquid has entered the casing, means for locking the pusher-bar during the time the liquid is flowing into and out of the casing, and means for unlocking said bar after the casing has been emptied of its contents.

26. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a pivoted bell-crank lever adapted to act on said valve-operating mechanism, a pusher-bar provided on one edge with teeth, said bar adapted to cause an operation of the valve-operating mechanism so as to open the inlet and allow a certain quantity of the liquid to pass into the casing, other mechanism acting on the bell-crank lever to close the inlet-opening and open the outlet-opening, after a certain quantity of the liquid has entered the casing, another bell-crank lever connected to the first-mentioned bell-crank lever, and a dog normally engaged by one arm of said other bell-crank lever, and thereby held out of engagement with the teeth of the pusher-bar, said dog adapted to be released by said bell-crank lever, when the other lever is turned, so as to permit the dog to engage the teeth of the pusher-bar, and thereby lock said bar during the time the liquid is flowing into the casing, and said bell-crank lever raising the dog out of engagement with the teeth of the pusher-bar, when the bell-crank lever which actuates the dog is turned in a reverse direction.

27. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a rocking shaft, provided with a projecting tappet, a pusher-bar provided on one edge with teeth, said bar on its inthrust adapted to act on the valve-operating mechanism so as to open the inlet and allow a certain quantity of the liquid to pass into the casing, other mechanism acting on the valve-operating mechanism to close the inlet-opening and open the outlet-opening, after a certain quantity of the liquid has entered the casing, said operation also causing a rotation of the shaft carrying the projecting tappet, and a pivoted dog normally in engagement with the teeth of the pusher-bar during the time the casing is being filled and emptied of its contents, but adapted to be turned out of engagement with said teeth by the tappet, as said tappet is swung around to a certain position, after the casing is fully emptied of its contents.

28. In a liquid measuring and discharging machine, the combination, of a casing having valve-controlled inlet and discharge openings, valve-operating mechanism, a rocking shaft provided with a projecting tappet, a pusher-bar provided on opposite edges with teeth, said bar adapted on its inthrust to act on the valve-operating mechanism so as to open the inlet and allow a certain quantity of the liquid to pass into the casing, other mechanism acting on the valve-operating mechanism to close the inlet and open the outlet opening, after a certain quantity of liquid has entered the casing, said operation also causing a rotation of the shaft carrying the tappet, a dog adapted to engage the teeth on one edge of the pusher-bar and to lock said bar during the time the liquid is flowing into the casing, means for raising the dog out of engagement with the teeth to unlock the rod, and a pivoted dog normally in engagement with the teeth on the other edge of the pusher-bar, during the time the casing is being filled and emptied of its contents, and adapted to be turned out of engagement with said teeth by the tappet, as said tappet is swung around to a certain position, after the casing is fully emptied of its contents.

604,262. CHURN AND BUTTER-WORKER. WILLIAM B. PERRY and CHARLES S. BROWN, Lake Mills, Wis., assignors to the F. B. Fargo & Company, same place. Filed Nov. 5, 1897. Serial No. 657,670. (No model.)

Claim.—1. The combination with a revoluble drum and rolls therein parallel with the axis of the drum the journals of which rolls extend through the drum and have gears thereon, of means for rotating the drum partial revolutions intermittently, and means therewith

for rotating the rolls on their axes in the periods of non-movement of the drum.

2. The combination with a revoluble drum and rolls therein parallel with its axis said rolls having journals extending through the drum and provided with gears thereon, of a driving-shaft provided with a gear-wheel eccentric to the axis of the drum disposed to mesh alternately with the gear-wheels on the several rolls and rotate them when by the rotation of the drum it is in a line with the axis of the drum and the axis of the roll, and means for revolving the drum.

3. The combination with a revoluble drum, of a loose pulley on the arbor of the drum, a disk or disks fixed on the arbor alongside the loose pulley, and a traveling belt or chain running on and partially around the arbor loose pulley, the belt or chain being provided with a dog or catch adapted to engage the disk or disks and rotate the arbor a partial revolution before release therefrom.

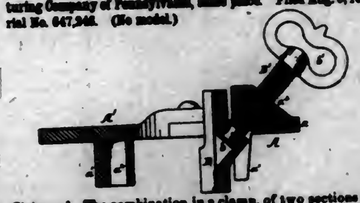
4. The combination with a revoluble drum provided with an axial arbor, of a loose pulley thereon, disks of greater diameter than the loose pulley alongside of the loose pulley fixed on the arbor, and a belt or chain traveling on the pulley between the disks and provided with a dog adapted intermittently to drop into recesses in the disks and rotate the arbor a partial revolution and then to be released therefrom.

5. The combination with a revoluble drum provided with an axial arbor, of a loose pulley thereon, a disk or disks alongside the loose pulley fixed on the arbor, a belt or chain traveling continuously on and partially around the loose pulley, a dog on the belt or chain adapted to engage the disk or disks intermittently and rotate the arbor a partial revolution, and a lever on which an idler is mounted, the lever being disposed to be lifted by contact with an eccentric-pin on said disk and thereby to force the idler against and raise the belt or chain holding the dog in engagement with the disk briefly and then by the release of the lever from the eccentric allowing the lever and idler to drop and the dog to suddenly escape from the disk or disks.

6. The combination with a revoluble drum having a fixed arbor, of a loose pulley on the arbor, a disk or disks fixed on the arbor alongside the loose pulley, a belt or chain running continuously on and partially around the loose pulley, a dog on the belt or chain adapted intermittently to engage the disk or disks and rotate the arbor a partial revolution, and a spring-actuated lever adapted to engage said disk and hold the same against rotation when it is not being moved by said belt or chain.

7. The combination with a revoluble drum having a fixed arbor, of a loose pulley on the arbor, a disk or disks fixed on the arbor alongside the loose pulley, a belt or chain running continuously on and partially around the loose pulley, a dog on the belt or chain adapted intermittently to engage the disk or disks and rotate the arbor a partial revolution, and an arm on the lever disposed to be engaged briefly by the dog on the belt or chain whereby by the movement of the belt or chain the lever is released from engagement with the disk and the arbor is permitted to rotate.

8. The combination with a revoluble drum having a fixed arbor, and rolls in the drum parallel with its axis said rolls having gear-wheels outside of the drum intermeshing with each other in the line of the axis of the drum, of a driving-shaft, a gear-wheel splined on the driving-shaft adapted to be shifted into and out of the plane of the roller gear-wheels and in position to mesh with each of said gear-wheels when adjacent to and in or near the line of the axis of said gear-wheel and the axis of the drum, and a driving gear-wheel on the drum-arbor for rotating the drum continuously and to be shifted into clutch with a belt or chain carrying wheel for rotating the drum intermittently.



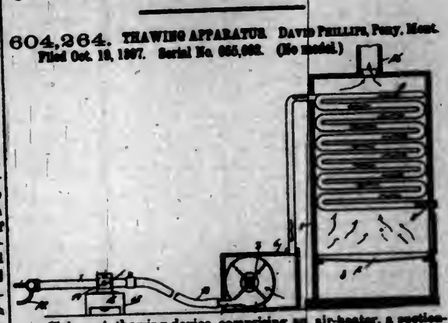
9. The combination with a revoluble drum having a fixed arbor, and rolls in the drum parallel with its axis, said rolls having gear-wheels outside of the drum intermeshing with each other in the line of the axis of the drum, of a driving-shaft, a gear-wheel 33 splined on the driving-shaft adapted to be shifted into and out of the plane of the roller gear-wheels and in position to mesh with each of said gear-wheels when adjacent to it in or near the prolonged line of the axis of said gear-wheel and the axis of the drum, a wheel 20 splined on the driving-shaft adapted when in action to rotate the drum, a wheel on the drum-arbor so disposed as on occasion to mesh with the wheel 20 on the driving-shaft, and a shifting bar slidable on the frame adapted concurrently to shift the drum-driving wheel and the roll-driving wheel.

10. In combination with a driven revoluble drum and a pair of roll-journal gears thereon intermeshing in the line of the axis of the drum, of a driving-shaft having a gear thereon adapted intermittently to mesh with said roll-journal gears, and a sliding weight-controlling box in which the driving shaft is mounted at one end, provided for a yielding of the parts in case of a mismeshing contact of a roll-gear and the driving-gear.

11. In an automatic gear-controlling device, the combination of a revoluble disk provided with an eccentric-pin, an idler-carrying lever 41 adapted intermittently to be lifted by contact with the pin on the revolving disk, a cam 43 on the lever, and a bar 33 provided with a pin 44 adapted when the bar is shifted in one direction to engage the cam and lift the lever out of the path of the pin on the disk.

12. In a combined churn and butter-worker, the combination with a revoluble drum, of two butter-working rolls in the drum parallel with but on different sides of and adjacent to its axis, two sets of hopper-like strips, the sets of strips being on opposite sides of the rolls, and means for rotating the drum a partial revolution intermittently.

604,268. CLAMP FOR SECURING PUMPS TO BARRELS. WILLIAM PEOPLES, Philadelphia, Pa., assignor to The Enterprise Manufacturing Company of Pennsylvania, same place. Filed Aug. 6, 1897. Serial No. 647,248. (No model.)

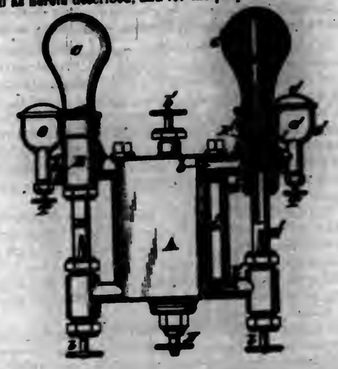


Claim.—1. The combination in a clamp, of two sections adapted to be inserted in a bung-hole of a barrel, with a clamp-plate carried by one section, with means for adjusting said plate by which the pump is secured to the barrel through the clamp, substantially as described.

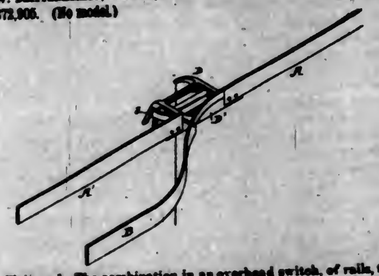
2. The combination in a clamp, of two sections, one section having a plate, with a winged extension, the other section having a plate and an extension, an inclined screw adapted to said section and a clamp-plate carried by the screw, substantially as described.

3. The combination of two clamp-sections adapted to be inserted in the bung-hole of a barrel and surrounding a pump, a pivot-pin securing the two sections together, a screw adapted to one of said sections, a clamp-plate carried by the screw and adapted to rest against the pump, substantially as described.

604,264. THAWING APPARATUS. DAVID PHILLIPS, Perry, Mont. Filed Oct. 19, 1897. Serial No. 655,092. (No model.)



Claim.—A thawing device comprising an air-heater, a suction-fan for drawing air from the heater, a flexible pipe receiving the discharge from the fan, a discharge-pipe having connection with the flexible pipe, nozzles on the discharge-pipe, a sleeve in which the discharge-pipe is axially and longitudinally adjustable, a plate having bearings in which trunnions on the sleeve engage, a block, a socket-plate on said block and with which the first-named plate engages, and a bolt passing from the first-named plate, through the socket-plate and through the block, substantially as specified.



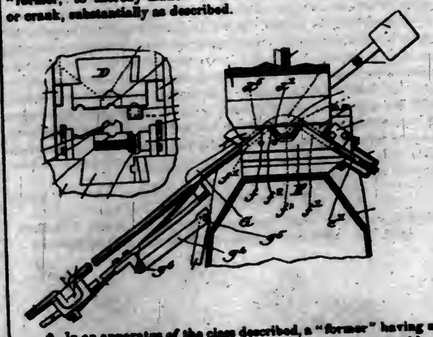
604,265. LUBRICATOR. JAMES POWELL, Avondale, Ohio, assignor to the William Powell Company, Cincinnati, Ohio. Filed Nov. 14, 1894. Serial No. 528,526. (No model.)

Claim.—1. The combination, in a sight-feed lubricator, of a reservoir; a condenser; a sight-feed chamber; an oil-discharge pipe communicating with said chamber; an external steam-pipe leading into the base of the condenser; a pipe within the latter, for conveying an upward current of steam; and, near the junction of said steam-pipe and condenser, a duct that conveys another current of steam down to said oil-discharge pipe, all as herein described, and for the purpose stated.

2. The combination, in a sight-feed lubricator, of a reservoir A; a condenser C, a sight-chamber H; an oil-discharge pipe E, communicating with said chamber; an external steam-pipe d' leading into the base of the condenser; a pipe c within the latter, for conveying an upward current of steam; a stand-pipe d; and a duct p that connects said pipes E and d, and conveys another current of steam downward, all as herein described, and for the purpose stated.

604,266. OVERHEAD SWITCH. JOSEPH S. ROSS and FREDERICK W. BEITTENMILLER, Philadelphia, Pa. Filed Mar. 7, 1898. Serial No. 672,905. (No model.)

Claim.—1. The combination in an overhead switch, of rails, two pivoted rail-sections interlocking one with the other, an arm on one section so arranged as to pass on either side of the pivot of the said section when operated, so that a down pull will shift the rails of the sections when in either position, substantially as described.



2. The combination in an overhead switch, of rails, the two pivoted rail-sections, one section interlocking with the other, the rail of one section acting as a weight when thrown back to hold the other rail-section in position, substantially as described.

3. The combination in an overhead switch, of rails, two pivoted rail-sections E, F, arms g g' on the rail-section F, a cam e' on the rail-section E adapted to work between the said arms and a projection e^3 on the rail-section E against which the arm g of the rail-section F strikes when the said rail-section is thrown out and the rail-section E is thrown in, and means for operating the said rail-section F, substantially as described.

4. The combination in an overhead switch, of rails, a frame secured to said rails, arms on the frame, two pivot-rods secured to said arms, a straight rail-section pivoted to one rod and having a cam, a curved rail-section pivoted to the other rod and having arms engaging the cam, and an operating-arm on the curved rail-section, substantially as described.

604,267. APPARATUS FOR MAKING CRANK-SHAFTS. CHARLES F. ROPER, Hopedale, Mass., assignor to the Draper Company, Portland, Me. Filed Sept. 27, 1897. Serial No. 653,093. (No model.)

Claim.—1. In an apparatus of the class described, a "former" having upwardly and oppositely inclined seats for and to receive the portions of the blank, at each side of and adjacent a preliminary bend therein, and a depressed portion between the inner ends of the seats, and a retaining device for one end of the blank when preliminarily bent to rest in said seats, combined with a cooperating die adapted to engage the convex side of the preliminary bend in the blank between the seats and reverse the curvature thereof, the die forcing the bent portion of the blank into the depressed portion of the "former," to thereby make the bottom and sides of the final bend or crank, substantially as described.

2. In an apparatus of the class described, a "former" having upwardly and oppositely inclined seats for the preliminarily-bent blank, and a wedge-shaped depression between them, the converging sides of said depression being substantially at right angles to the adjacent seats, combined with a cooperating die having a wedge-shaped projection to engage the bent portion of a blank resting in the seats and to force the same into the depression of the "former," substantially as described.

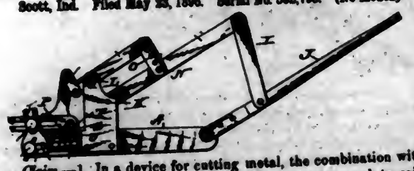
3. In an apparatus of the class described, a "former" having upwardly and oppositely inclined seats and a wedge-shaped depression therebetween; a projection on the former having a recessed top, and longitudinal seats in the "former" oppositely extended from the base of said projection, in alinement with each other and in the plane of the recess; and a swaging-recess in said "former," combined with a die having a wedge-shaped projection to cooperate with the similarly-shaped depression in the "former;" a cavity in the die to be entered by the projection on the "former," and a swaging-recess, whereby a blank may be acted upon by said die and "former" to form successively a bend therein having divergent sides, straighten the sides of and set the bend, and finally swage the latter, substantially as described.

4. In an apparatus of the class described, a "former," a cooperating die, one of which is movable toward and from the other, said die and "former" being constructed to act upon a blank to form a crank therein by successive steps, and a yielding stop-gage for the end of the blank, substantially as described.

5. In an apparatus of the class described, a "former," a cooperating die, one of which is movable toward and from the other, said die and "former" being constructed to act upon a blank to form a crank therein by successive steps, a guide-block to receive a completed crank while a second crank is being formed in the blank, and a pivotally-mounted support for said guide-block, substantially as described.

6. In an apparatus of the class described, a "former," a cooperating die, one of which is movable toward and from the other, said die and "former" being constructed to act upon a blank to form a crank therein by successive steps, a guide-block having a crank-receiving recess, a projection to hold the completed crank when the blank is reversed, and means to move the guide-block, said recess and projection thereon being adapted to cooperate respectively with successively-operating portions of the die and "former," substantially as described.

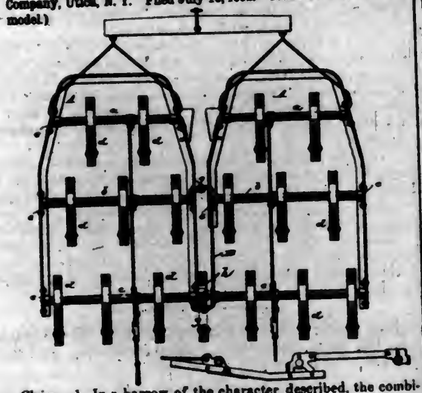
604,268. PHOTOGRAPHIC-PLATE HOLDER FOR THREE-COLOR PROCESSES. GUSTAV SELLS, Brandenburg, Germany. Filed May 27, 1897. Serial No. 638,472. (No model.)



Claim.—A frame b and a case a movable longitudinally in said frame the said case having in the line of its movement three compartments divided by bars d, said bars having rabbets for receiving photographic sensitive plates and having slots in front of and parallel with said rabbets, in combination with three light-filters inserted in said slots, one in each compartment, substantially as and for the purpose described.

604,269. PHOTOGRAPHS IN NATURAL COLORS. GUSTAV SELLS, Brandenburg, Germany. Filed Apr. 20, 1896. Serial No. 587,520. (No specimens.)

Claim.—The process for the production of natural-colored photographs from three negatives, taken with interposition respectively of three differently-colored light-filters, consisting in forming three plates by spreading upon a firm support an excessively thin adhering coating of collodion and upon the latter an adhering coating of colorless chromated gelatin emulsion, exposing the plates so formed respectively behind the negatives with the gelatin coating in contact with the negative, immersing each plate in cold water containing a dye or solution complementary to the color of the light-filter used for the corresponding negative, subsequently detaching the collodion films with the gelatin films thereon from the supports and superposing said detached films.



604,270. DEVICE FOR CUTTING IRON. HOMER J. SHAFFER, Scott, Ind. Filed May 23, 1896. Serial No. 592,793. (No model.)

Claim.—1. In a device for cutting metal, the combination with the base provided with a fixed cutter, the uprights secured to said base, and the cutter pivoted thereto, of the arms pivotally connected with said cutter, the bar pivoted to said uprights and arms, the arms pivoted to said bar and formed with a number of holes, the bar pivotally connected thereto and to said uprights, the removable keys or pins, the bar pivoted to said last-mentioned bar and the lever pivoted thereto and to said base, substantially as described.

2. In a machine for cutting metal, the combination with the base-plate, provided with a cutter, the pivot-pin secured to said base-plate, the plate pivoted thereto provided with a cutter and means for actuating the same, of the angle-plate formed with a vertical slot through which said pivot-pin passes and with a horizontal slot, the vertical plate formed with a vertical and a horizontal slot, the set-screws and the nuts to secure and adjust the same, substantially as described.

604,271. SPRING-TOOTH HARROW. CHARLES S. SHARP, Auburn, N. Y., assignor, by mesne assignments, to the National Harrow Company, Utica, N. Y. Filed July 16, 1892. Serial No. 440,289. (No model.)

Claim.—1. In a harrow of the character described, the combination of two side-bar sections hinged together side by side, the inner side bar of one section having a bridge-piece standing above the adjacent side bar of the other section.

2. In a harrow of the character described, the combination of two side-bar sections hinged together side by side, the inner side bar of one section having a bridge-piece standing above the adjacent side bar of the other section to form a lateral passage for rubbish, and a tooth mounted between the two sections adjacent to said passage.

3. In a harrow of the character described, the combination of two frame-sections hinged together side by side, the inner side bar of one section being shorter than that of the other section, shaft-supporting standards on said frames, tooth-supporting shafts journaled in said standards, a bridge-piece B connected to the top of one of said standards to form an extension of the short side bar, and a tooth mounted between the frame-sections at the rear end of the bridge-piece.

4. In a harrow, the combination of a frame comprising an outside and an inside runner, shaft-bearing standards secured thereto, rock-shafts journaled in said standards, and means for rocking said shafts in unison, and another frame having an outside runner, a short inside runner, and an elevated bridge-piece, supported upon it and extending rearwardly and standing above the adjacent runner of the other frame, shaft-bearing standards secured to said frame, rock-shafts journaled therein, and means for rocking said shafts in unison, the two frames being connected together, substantially as described.

5. In a harrow of the character described the combination of a frame composed of two angle-iron sections A, A', hinged together, the threads of which serve as runners, the section A being bent substantially U shape, presenting two parallel runner-bars, and the section A' being bent to include a front end and a single outside runner-bar, and a short inside runner and therefore affording a lateral clearance-passage adjacent the runner of the adjoining section, harrow-teeth supported by said sections and movable with relation thereto, whereby the teeth or runners may be brought into operative position at the will of the operator.

6. In a harrow of the character described, the combination of a frame having shaft-bearing standards, shafts borne by said standards, and harrow-teeth thereon, and another frame having shaft bearing standards, shafts borne by them, and harrow-teeth, and pivot connections joining the adjacent shaft-bearing standards of said frames, and operating to support the inner side of one of said frames in elevated position at such connecting-points.

7. A harrow composed of two runner-bearing sections, the frame of one section being cut away upon the side adjoining the second section, and partially supported where cut away by said second section.

8. A two-section spring-tooth harrow, one of the sections of which comprises a frame, a pair of runners borne by it, a set of spring harrow-teeth supported by it, and means for varying the relative planes occupied by the teeth and runners, and the other section of which comprises a frame cut away upon the side adjoining the aforesaid section to present a clearance-passage, and partially supported where cut away by said section, a runner at the opposite side borne by said frame, a set of spring harrow-teeth supported by said frame, and means for varying the relative planes occupied by said teeth and runner, substantially as described.

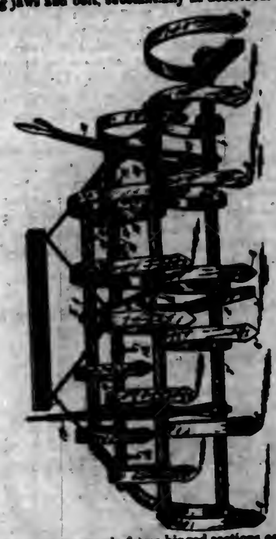
9. In a harrow, the combination of spring-teeth, with the opposite sections of a frame hinged together, and each comprising draft-bars, and top-carrying bars having their tooth-supporting surfaces arranged in an elevated position but beneath the hinge-pins of said sections and having depending arms at the ends secured to the draft-bars, substantially as described.

10. A harrow provided with outside and inside runners, a portion of one of said inside runners being removed or elevated, substantially as and for the purpose set forth.

11. A sectional harrow provided with outside and inside runners, the inside runner of one section being cut off, and an elevated bar supported thereby to afford a clearing-space for the harrows between the sections.

12. A sectional harrow provided with outer and inner frame-bars that serve as runners, one of the runners being located centrally of the sections and supporting directly a portion of the frame and also carrying an elevated bar which supports another part of the frame whereby a lateral clearance is afforded between the sections.

604,272. SPRING-TOOTH HARROW. JACOB B. SHEDDLY, Harrisburg, Pa., assignor, by mesne assignments, to the National Harrow Company, of New Jersey. Filed Jan. 18, 1892. Serial No. 458,233. (No model.)



Claim.—1. A harrow having a frame including among its members rigidly-secured transverse rods said hollow rock-shafts loosely mounted on said rods, harrow-teeth rigidly secured to said rock-shafts and means for holding said shafts in different positions to adjust the harrow-teeth, substantially as described.

2. In a harrow the combination with the side bars, of transverse rods rigidly secured to the side bars, hollow rock-shafts loosely mounted upon said rods, harrow-teeth secured to said rock-shafts and means for rocking said rock-shafts, substantially as described.

3. In a harrow the combination with the hollow rock-shafts, of rods extending entirely through the shafts and jam-nuts securing said rods to the sides of the frame, whereby the frame is made rigid and the shafts left free to turn on said rods, substantially as described.

4. A socket for harrow-teeth formed in one piece provided with an aperture to engage the tooth-bar, a socket to receive the tooth, clamping-jaws and a clamping-bolt, the said tooth-bar aperture extending into the tooth-socket whereby the clamping-bolt clamps the tooth against the tooth-bar, substantially as described.

5. In a harrow the combination with the circular-surfaced tooth-bars, of a socket formed in one piece having a tooth-socket, a circular aperture for the tooth-bar extending into the tooth-socket and the clamping jaws and bolt, substantially as described.

6. A harrow composed of two hinged sections each section having a runner on its outer side, the two sections having a runner construction for supporting the inner sides of the sections, said inner runner construction forming a part of the inner side bars of the said sections, substantially as described.

7. A harrow composed of two hinged sections, each section having a runner on its outer side forming the outer side bar of such section, the said harrow having an inner or central runner construction forming a part of the inner side bars of the said sections, a part of the inner side bars of said sections being held out of contact with the ground to facilitate clearance, substantially as described.

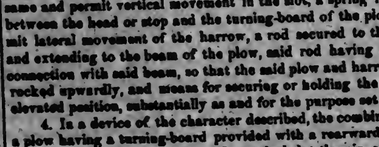
8. In a sectional turnable-tooth-bar harrow, the combination therewith of the three runners or draft-bars, the outer runner on each section being deflected inwardly, hinged together at their front; the turnable tooth-bars mounted on the runners and lever operating mechanism, substantially as set forth.

9. The combination in a harrow of the tooth-bar; the tooth-clip surrounding the tooth-bar provided with an opening to allow the tooth-bar to engage the tooth; a transverse tooth-seat through the clip below the tooth-bar, a curved spring-tooth and a screw-threaded binder for securing the parts, as set forth.

10. In a sectional three-runner harrow, the combination of turnable tooth-bars arranged across the line of draft and carrying teeth, and draft-bars or runners, the draft-bars of a section connected at the front by a cross connection integral with and at right angles to the inner draft-bar or runner, substantially as described.

11. In a sectional harrow, the combination of draft-bars or runners deflected upwardly at their front portions and at the front connected by an elevated cross-bar from which one runner extends at right angles, said bars bent from one integral metal bar, and tooth-bars connecting and carried in an elevated plane above the runners and provided with teeth and adjusting means, substantially as described.

12. In a turnable-tooth-bar harrow, the combination of the draft-bars or runners having their front ends deflected upwardly, a series of turnable tooth-bars mounted in brackets in an elevated plane above the draft-bars in substantially the same horizontal plane with the front elevated portion of the draft-bars, and lever-operating mechanism for the purposes stated.



13. In a sectional harrow the combination of three runners, the tooth-bars supported in an elevated plane above the plane of the runners, and the supporting-hinges between the sections, substantially as shown.

14. In a sectional harrow, the combination of outer and inner runners, the runners of a section formed in one piece and continued across the front with the inner runner extending backward at a right angle and in the line of draft and parallel with the outer runner in a portion of its length, the turnable tooth-bars elevated above the plane of the runners and carrying teeth, and centrally-disposed hinges between the sections, substantially as described.

15. A sectional harrow consisting of three runners or draft-bars to each two sections; turnable tooth-bars; separating and supporting connections for separating and supporting the turnable tooth-bars in an elevated plane above the runners or draft-bars and hinges between the sections, as set forth.

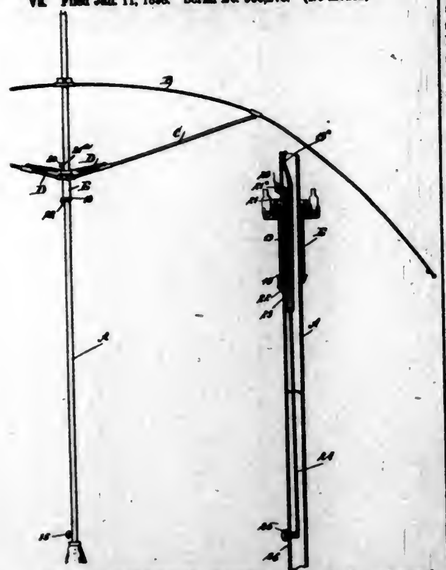
16. A sectional harrow consisting of three runners or draft-bars to each two sections; turnable tooth-bars having curved spring-teeth; separating and supporting connections for separating and supporting the turnable tooth-bars in an elevated plane above the runners or draft-bars and hinges between the sections, as set forth.

604,273. LOCKING DEVICE FOR GUN-BARRELS. VALERIAN SOLOGOUBENSKY, St. Petersburg, Russia. Filed June 1, 1897. Serial No. 639,016. (No model.) Patented in Germany Apr. 3, 1897, No. 94,733, and in England Apr. 20, 1897, No. 9,982.

Claim.—The combination with the mortised frame provided with the arc-shaped bridge-piece 6, of the barrel provided with the lug 3 having an arc-shaped slot 7 and having corresponding recesses 8 formed in the opposite walls of said slot, the locking-bolt 9 arranged to reciprocate transversely in the frame and having a flat head adapted to engage the recesses 8 to lock the barrel, and a spring for throwing said bolt into engagement with the recesses, substantially as described.

604,274. COMBINATION PLOW AND HARROW. ARTHUR DE FOREST SPERRY, Hamilton, Mont. Filed Aug. 26, 1897. Serial No. 649,254. (No model.)

Claim.—1. The combination with a plow having a vertical or approximately vertical slot in the turning-board thereof, of a harrow having a projection extending through said slot, means for securing the projection in said slot so that the same will have vertical movement therein, and suitable braces between the plow-beam and the harrow, substantially as and for the purpose set forth.



2. In a combined plow and harrow, the combination with a plow having a vertical or approximately vertical slot in the rear portion of the turning-board thereof, of a harrow provided with an extension passing through said slot, said extension being provided with a head or stop to secure the harrow to the turning-board and permit the same to have vertical movement in the slot therein, a spring interposed between the head or stop and the turning-board to permit independent lateral movement of the harrow, and suitable braces between the harrow and the plow-beam, substantially as and for the purpose set forth.

3. In a device of the character described, the combination with a plow having a vertical or approximately vertical slot in the turning-board thereof, of a harrow provided with an extension passing through said slot, said extension being provided with a head or stop on the other side of the turning-board to secure the harrow to the same and permit vertical movement in the slot, a spring interposed between the head or stop and the turning-board of the plow to permit lateral movement of the harrow, a rod secured to the harrow and extending to the beam of the plow, said rod having a pivoted connection with said beam, so that the said plow and harrow can be rocked upwardly, and means for securing or holding the harrow in elevated position, substantially as and for the purpose set forth.

4. In a device of the character described, the combination with a plow having a turning-board provided with a rearward extension having a vertical or approximately vertical slot therein, of a harrow

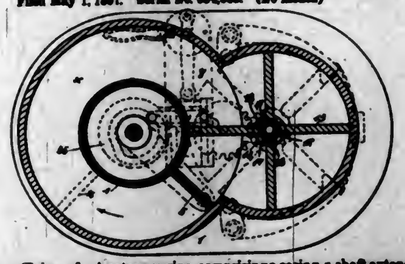
provided with a projection, extending through said slot and provided with a head or stop to secure the harrow to the turning-board and permit the same to have vertical movement in said slot, a spring interposed between said slot and the turning-board to permit lateral movement to the harrow, braces between the plow-beam and the harrow, said harrow being adapted to be lifted out of contact with the ground, and the means for holding said harrow in elevated position, substantially as and for the purpose set forth.

604,275. SELF-CLOSING UMBRELLA. FRANK R. STOVER, Luray, Va. Filed Jan. 11, 1898. Serial No. 666,576. (No model.)

Claim.—1. In an umbrella, the combination with ribs, and stretchers, of a runner having in its upper face seats in which the lower ends of the stretchers loosely rest, and coil-springs secured to the stretchers and to the upper portion of the runner, whereby the springs serve to hold the stretchers to the runner and also to force the runner downward when released from its locking device, substantially as described.

2. In an umbrella, the combination with the runner, said runner being provided with an annular groove in its upper surface, and slots crossing the said groove at intervals, of stretchers having their lower ends formed to enter the said slots, and provided with transverse pivots that seat in the said groove, and coil-springs attached to the stretchers and to the upper face of the runner, the springs serving to hold the stretchers in rockable engagement with the runner, as specified.

3. In a folding umbrella, the combination of a runner having a collar on its upper end and provided on its upper face with an annular groove, and with slots crossing said groove, stretchers provided at their lower ends with transverse pivots seated in the groove of the runner, and coil-springs having one end secured to the collar of the runner and their other ends secured to the stretchers, substantially as and for the purpose set forth.

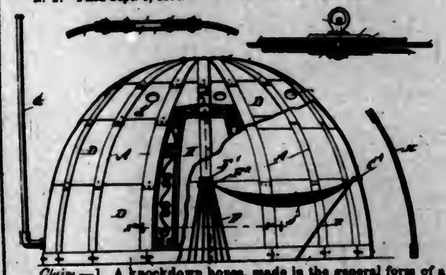


4. In a folding umbrella, the combination with a tubular stick provided with spaced openings, and a runner on the stick, of a latch within the stick and having its upper end bearing against the inner face of the stick, the said latch being provided with lugs projecting out through the openings of the stick, one of said lugs having limited movement in the opening of the stick while the other is free to work in and out in its opening, and an operating-rod secured to the latch and extending to the handle end of the stick, substantially as described.

5. In an umbrella, the combination with a tubular stick provided with spaced openings, and a runner on the stick, of a latch within the stick and provided with lugs projecting through the openings of the stick and with a tongue at its upper end, the upper lug of the latch being loosely held in its opening, and an operating-rod secured to the latch extending to the handle end of the stick and projecting out through an opening therein, substantially as described.

6. In an umbrella, the combination with a tubular stick provided with two spaced openings at its upper end and with an opening at its lower end, and a runner on the stick, of a latch within the stick and provided with a tongue at its upper end bearing against the inner face of the stick and with two lugs, the upper lug projecting through one of the openings in the stick and having a pin passing through it to hold it in the opening, the lower lug being free to move in and out of the opening in the stick, and an operating-rod secured to the latch and provided at its lower end with a knob projecting out through the opening at the lower end of the stick, substantially as described.

7. A closing umbrella, comprising a tubular stick, a runner mounted on the stick, ribs pivoted to the upper end of the stick, stretchers pivoted to the ribs and loosely seated in the runner, coil-springs secured to the stretchers and runner, a pivoted and sliding latch within the stick for engaging the runner, and an operating-rod secured to the latch and extending to the handle end of the stick and projecting out through an opening therein, substantially as herein shown and described.



604,276. ROTARY ENGINE. WILLIAM R. SUTTON, Belvidere, Ill. Filed May 1, 1897. Serial No. 634,662. (No model.)

Claim.—1. A rotary engine, comprising a casing, a shaft extended through said casing, pistons mounted on the said shaft but isolated one from the other, each piston comprising a cylinder or hub portion and a radial wing, an abutment-wheel for each piston, each abutment-wheel consisting of a hub portion having inlet and outlet ports and radial blades, means for controlling the admission of steam through said ports, disks mounted on the hub portions of the abutment-wheels, the said disks being provided with radial slots, dogs pivoted in the casing, there being two dogs for each disk, the said dogs having fingers to engage in the slots of the disks, and means for moving said dogs into and out of engagement with the disks, substantially as specified.

2. A rotary engine, comprising a casing, a shaft extended through said casing, pistons mounted on said shaft but isolated one from the other, each piston comprising a cylinder or hub portion and a radial wing, an abutment-wheel for each piston, each abutment-wheel consisting of a hub portion having inlet and outlet ports and radial blades, means for controlling the admission of steam through said ports, disks mounted on the hub portions of the abutment-wheels, the said disks being provided with radial slots, dogs pivoted in the casing, one at the upper side and one at the lower side of each disk, the said dogs having finger portions to engage in the slots, spring-pressed tappets carried by the dogs and adapted to move the dogs and also to move relatively to the dogs, and arms extended from the shaft, having pins designed to engage in the slots of the disks, substantially as described.

604,277. KNOCKDOWN HOUSE. PETER A. TOTTY, New York, N. Y. Filed Sept. 9, 1897. Serial No. 651,115. (No model.)

Claim.—1. A knockdown house, made in the general form of a dome, having ribs formed of plates secured together so as to leave a groove in each edge, a central crown formed of two plates secured together and having sockets between their edges adapted to receive the upper ends of the ribs, and plates adapted to enter the grooves in the edges of the ribs and fit between adjacent ribs, substantially as described.

2. A knockdown house, made in the general form of a dome, having ribs formed of plates secured together so as to leave a groove in each edge, said ribs being made in sections which may be secured together at their ends, the outer layer of each section registering with the groove in the section next above, a central crown, consisting of two plates secured together and having sockets between their edges adapted to receive the upper ends of the ribs, and plates adapted to enter the grooves in the edges of and fit between the adjacent ribs, substantially as described.

3. A knockdown house, having hooks or eyes attached to the inner walls thereof at intervals, and a central stand having hooks or rings thereon, said wall and center rings being adapted to support hammocks, substantially as described.

4. A knockdown house, composed of ribs meeting at their upper ends and having grooves in their edges, segmental plates adapted to fit the grooves in the edges of the ribs, and an encircling band surrounding the base of the house, said ribs and bands being made in sections and bolted together, substantially as described.

5. A knockdown house, composed of vertical ribs meeting at their upper ends and having grooves in their edges, segmental plates adapted to fit the grooves in the edges of the ribs, and an encircling band surrounding the base of the house, said ribs and bands being made in sections and bolted together, said house having a door-opening on one side, guides adjacent thereto, and a door sliding therein, substantially as described.

6. A knockdown house, composed of ribs meeting overhead and having grooves in their edges, a central crown receiving the upper ends thereof, said crown being formed of two plates having a spacing-washer between, segmental plates adapted to fit the grooves in the edges of the ribs, and an encircling band surrounding the edges of the house and secured to the lower ends of the ribs, substantially as described.

7. A sectional or knockdown house, having ribs formed in short sections, each section consisting of two outer plates of substantially the same width and an interposed plate of narrower width, thus forming a groove in each edge, the plates at the joining ends of the sections projecting successively at a greater distance, and adjacent sections being joined to each other by butting an outer plate of each section against the central plate of the other section, and securing the sections through the overlapping parts, substantially as described.

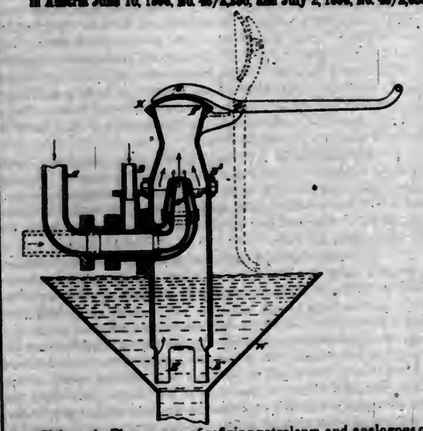
604,278. EXPANDING HUB. LOUIS P. VOLLRATH, San Antonio, Tex. Filed July 23, 1897. Serial No. 645,722. (No model.)

Claim.—1. In a wheel, a spindle-box screw-threaded on both ends, a central portion of said box larger than the main body and tapering toward the forward end of the same, said tapering portion being screw-threaded, a nut integral with the box and near the rear of the same, an expanding-ring provided on the interior with threads, and clamping-rings; all combined and operating substantially as described.

2. In a wheel, a spindle-box screw-threaded on both ends, a central portion of said box larger than the main body and tapering toward the forward end, screw-threads formed on said tapering portion, a nut formed integral with and near the rear of the box, an expanding-ring engaging said tapering portion, clamping-rings, and a forward and rear cap to cover the box, an annular rib on the inside of the forward cap having screw-threads in its face adapted to engage the threads on the box, a cap-nut screw-threaded on the inside and adapted to screw on the forward end of the box and jamb against the said rib, thereby locking the parts against movement.

3. In a wheel, a spindle-box screw-threaded on both ends, an enlarged tapering central portion also screw-threaded, a nut integral with and near the rear of said box, an annular groove in the forward end of the same, a section-ring tapered and screwed-threaded on the inside, spoke-sockets in the periphery of said ring, collars adapted to fit around and bear against the said ring, and a bracing-ring fitting around the periphery of said collars and provided with slots through which the spokes pass, the forward and rear hub-caps, an annular rib having threads in its face inside the forward cap adapted to engage the box, a cap-nut threaded on the inside, an annular rib having a screw-threaded face inside the rear cap; and a set-screw passing through the rear cap and engaging the box.

604,279. SAW. FRANK W. WALQUIST, GULBRAND NELSON, and JOHN L. GRONDAHL, Brooklyn, N. Y.; said Walquist assignor of one-third of his right to Henry G. Towles, Washington, D. C. Filed Dec. 13, 1896. Serial No. 616,116. (No model.)



Claim.—1. The combination in a saw of the alternate taper-faced channeling-teeth and the upset-faced finishing-teeth, the channeling-teeth being longer and narrower than the finishing-teeth substantially as described.

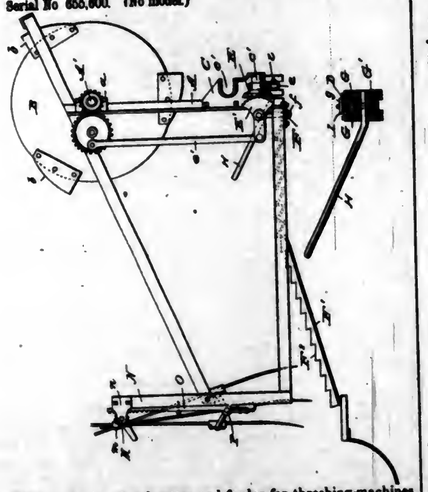
2. The combination in a saw of the alternate taper-faced channeling-teeth and the upset finishing-teeth, the channeling-teeth being longer and narrower than the finishing-teeth, and the finishing-teeth having the narrow side faces parallel, transversely, with the sides of the saw-plate substantially as described.

3. The combination in a saw of alternate channeling-teeth and finishing-teeth, the channeling-teeth being longer and narrower than the finishing-teeth, and the finishing-teeth being upset on the face and their sides tapered from the cutting edge backward substantially as described.

604,280. PROCESS OF AND APPARATUS FOR REFINING CRUDE PETROLEUM, &c. HERMANN WOLF, Ludwigshafen-on-the-Rhine, Germany, assignor to the Badische Anilin und Soda Fabrik, same place. Filed Feb. 7, 1896. Serial No. 578,441. (No model.) Patented in England Dec. 6, 1895, No. 23,436; in Germany Jan. 23, 1896, Nos. 93,013 and 93,708; in Hungary Mar. 24, 1896, No. 5,954, and in Austria June 10, 1896, No. 46/2,230, and July 2, 1896, No. 46/2,635.

Claim.—1. The process of refining petroleum and analogous oils which consists in injecting a stream of sulfuric acid between two streams (one of which is oil) moving at different velocities, substantially as described.

2. The process of refining petroleum and analogous oils which consists in injecting a stream of sulfuric acid between two streams (one of which is oil) moving at different velocities, said oil and acid being made to stream in parallel directions, substantially as described.



3. The process of refining petroleum and analogous oils which consists in injecting a stream of fuming sulfuric acid between two streams of oil moving at different velocities then treating the said oil with non-fuming sulfuric acid to remove acid-impurity combinations and then washing the oil, substantially as described.

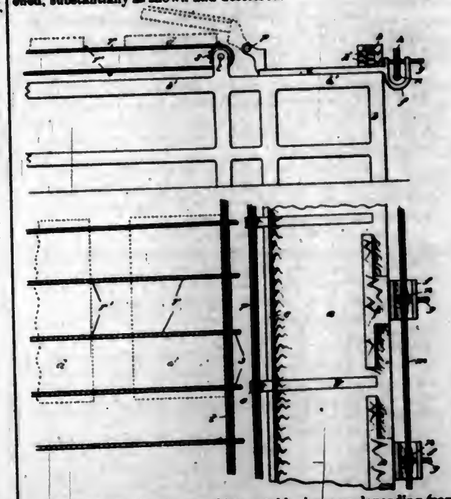
4. A refining apparatus comprising a cylindrical casing provided with concentric inlet or injection nozzles and having a constricted portion above the nozzle-mouths and below the upper extremity of the casing; said casing having its upper portion provided with a lid and its lower portion provided with lateral inlets, substantially as described.

5. A refining apparatus comprising a cylindrical casing provided with concentric inlet or injection nozzles and having a constricted portion above the nozzle-mouths and below the upper extremity of the casing combined with a tank or vessel (one or more) made to

communicate with the lower part of the casing, substantially as described.

604,281. BAND-CUTTER AND FEEDER FOR THRESHING-MACHINES. FRANK J. WOOD, Pipe Stone, Minn. Filed Oct. 18, 1897. Serial No. 655,600. (No model.)

Claim.—1. In a band-cutter and feeder for threshing-machines, the combination with a frame having journaled thereto a shaft upon which is mounted a series of cutting-disks, a series of agitating-fingers positioned below said cutting-disks, the journals of the cutting-disks being at right angles with the shaft and provided with pinions, a reciprocating rack-bar in engagement with the pinions for imparting an oscillating movement to the agitating-fingers, a feed-board supported at one end by a rock-shaft, and connecting means substantially as shown for reciprocating the feed-board and rack-bar from the shaft carrying the cutting-disks.

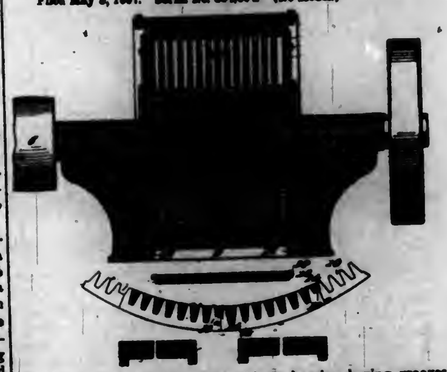


2. In a band-cutter and feeder for threshing-machines a frame having a cross-bar to which are attached parallel bars of agitating-fingers journaled in said bars, pinions carried by the agitating-fingers and a rack-bar with depending teeth which engage with the pinions, and means for reciprocating the rack-bar substantially as shown and for the purpose set forth.

3. In a band-cutter and feeder for threshing-machines, a supporting-frame made up of angle-bars arranged and connected substantially as shown, of castings attached to the rear vertical bars of the frame said castings having recesses *d* and inwardly-projecting members *c* to which a cross-bar of the frame is attached, one of the castings having outwardly-projecting lugs, a gear journaled between said lugs, a rack-bar connected to the gear, agitating-fingers and pinions carried thereby with which the teeth of a rack-bar mesh, a rock-shaft journaled to the vertical bars of the frame, a feed-table one end of which is movably supported by the rock-shaft, a gear having a projecting member carried by the rock-shaft so as to mesh with the gear carried by the casting and a pitman connected to the projecting portion of the gear for actuating the table and agitating-fingers, the parts being combined, substantially as shown and for the purpose set forth.

4. In a band-cutter and feeder for threshing-machines, the combination of the rotary band-cutters mounted upon a driven shaft, a pinion carried by said shaft, a gear-wheel which engages with the pinion, a pitman connected with said gear-wheel and to a gear E', a rock-shaft suitably journaled the gear E' being attached thereto on a line with the journals of the shaft a feeding-board supported at one end by the rock-shaft, a gear E in mesh with the gear E' a reciprocating bar connected to the gear E, said reciprocating bar having rack-teeth for engagement with pinions on agitating-fingers journaled between parallel bars G, the agitating-fingers projecting over the feeding-board, the parts being organized substantially as shown and for the purpose set forth.

604,282. STRAIGHTENING-MACHINE. JOHN ZIMMER, Pittsburg, Pa. Filed June 1, 1897. Serial No. 639,062. (No model.)



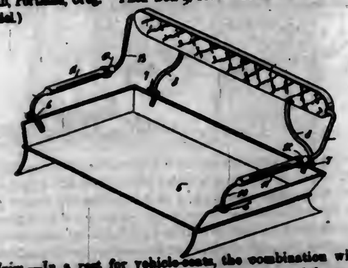
Claim.—1. In a straightening-machine, the combination of a table having U-shaped hangers depending therefrom, screws journaled in said hangers and connected to heads or straightening-blocks, an operating-shaft carrying worms to engage worm-wheels on said screws, a shaft journaled on the opposite side of said table and carrying arms operating on said table to remove the plates or flat iron when straightened, substantially as shown and described.

2. In a straightening-machine, a table, hangers depending from said table and having screws journaled therein, heads or straightening-blocks connected to said screws, said blocks having a series of spring-actuated bars mounted thereon, worm-wheels mounted on said screws, a shaft provided with worms engaging the worm-wheels to operate the heads or straightening-blocks, and means for removing the plates, substantially as shown and described.

3. In a straightening machine, a suitable table, a frame for supporting same, hangers secured to said table, screws journaled in said hangers connected to the head-block carrying a series of spring-actuated bars, worm-wheels on said screws, an operating-shaft carrying worm-screws to engage said worm-wheels, lifting-arms to remove the plate from the table, and means for operating said lifting-arms, in combination with a carrier adapted to receive the plate from said lifting-arms, substantially as shown and described.

604,283. PULVERIZER. HERMAN S. ALLENSWORTH, St. Louis, Mo. Filed May 3, 1897. Serial No. 634,494. (No model.)

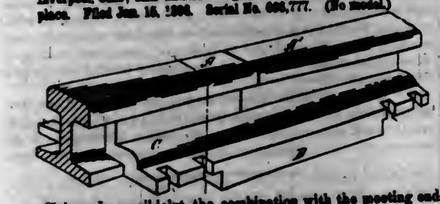
Claim.—1. A pulverizer comprising a housing having grooves in the inner faces of the side walls thereof, a revolving cylinder, sectional removable side plates having notches and fitting in the grooves, and the bars having their ends fitting in the notches of the side plates and providing a screen; substantially as described.



2. A pulverizer comprising a housing having grooves in the inner faces of the side walls thereof, a revolving cylinder, sectional removable side plates having notches of different depths and fitting in the grooves, the bars fitting in the deepest notches, and the bars having notched ends fitting in the notches of less depth to hold the side plates in position independent of other fastenings; substantially as described.

3. A pulverizer comprising a housing having inner and outer grooves in the inner faces of the side walls thereof, a revolving cylinder, sectional removable side plates having notches and fitting in the outer grooves, the bars having their ends fitting in the notches of the side plates, and providing a screen, and the wear-plates fitting in the inner grooves; substantially as described.

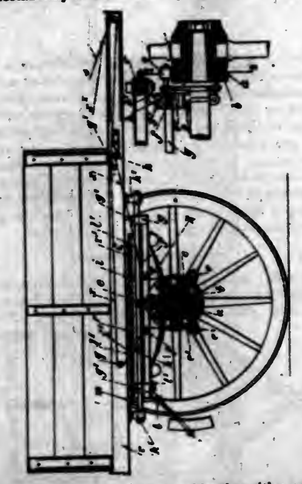
4. A pulverizer comprising a housing having side walls formed with an outer groove, and an inner groove of less depth than the outer groove, a revolving cylinder, sectional removable side plates having notches and fitting in the outer grooves, the bars having their ends fitting in the notches of the side plates and providing a screen, and the wear-plates fitting in the inner grooves; substantially as described.



5. A pulverizer consisting of a housing, a revolving cylinder, and a screen; said cylinder being composed of a shaft, a number of spiders each having two pairs of arms, and hammers pivoted to the arms of the spiders; one pair of arms of each spider being located to one side of the other pair of arms of said spider, substantially as set forth.

604,284. BACK-REST FOR VEHICLE-SEATS. ROBERT C. ALFORD, Portland, Oreg. Filed Dec. 3, 1897. Serial No. 660,497. (No model.)

Claim.—In a rest for vehicle-seats, the combination with the seat, of a back-rest ranging transversely at the rear of the seat, two braces attached to the back-rest and extending downward and pivotally mounted on the seat at the rear portion thereof, two rods pivotally connected with the respective ends of the back-rest and extending forwardly, two cylinders in which the rods are respectively slidable, the cylinders being mounted at their front portions to swing at the respective sides of the seat, and a spring contained in each cylinder and pressing against the rod therein.



604,285. RAIL-JOINT. PHILIP W. ARNOLD and JOHN KELL, East Liverpool, Ohio; said Arnold assignor to William Jack Curry, same place. Filed Jan. 15, 1898. Serial No. 666,777. (No model.)

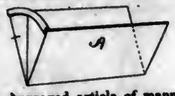
Claim.—In a rail-joint, the combination with the meeting ends of two rails, of a connecting-plate, consisting of a base portion extending below the base of the rails, and running to a point near the ends of the plate proper, forming abutting shoulders which are adapted to bear against the sides of the ties for holding the plate in a rigid position, side arms cast integral with the plate, one of which extends upward to a point underneath the head of the rails, and the other extending upward and embracing the side of the head of the rails, forming a reinforced bearing therefor, together with recesses formed in the edges of the base of the plate for receiving spikes for securing the plate in a rigid position, substantially as shown and for the purposes described.

604,286. VEHICLE-BRAKE. RENÉ M. ARTUS, Gonneville, France. Filed Apr. 24, 1896. Serial No. 587,902. (No model.) Patented in France Sept. 28, 1894, No. 241,086, and in Germany Apr. 14, 1896, No. 87,868.

Claim.—1. In a brake mechanism, the combination with a vehicle having one of its constituent parts movable longitudinally relatively to the wheels, of an expansible collar loosely mounted on a rotating part of the vehicle, a cord or chain wound around the said collar and connected with the movable part of the vehicle, and a brake operated by the movement of the said movable part of the vehicle, substantially as herein shown and described.

2. In a brake mechanism, the combination with a vehicle having one of its constituent parts longitudinally movable relatively to the wheels, of an expansible collar loosely mounted on a rotating part of the vehicle, a chain or cord wound around the said collar and connected with the movable part of the vehicle, a pivoted brake-lever, and a connection between the brake-lever and the said movable part of the vehicle, substantially as herein shown and described.

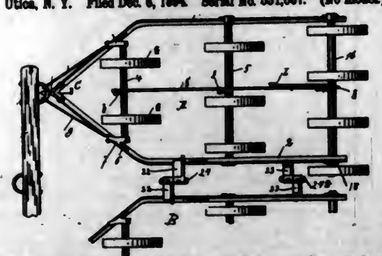
3. In a brake mechanism, the combination with a vehicle having one of its constituent parts longitudinally movable and spring-pressed, of an expansible collar loosely mounted on the hub of one of the wheels of the vehicle, a cord or chain wound around the said collar and connected with the movable part of the vehicle, a pivoted brake-lever, and a connection between the said brake-lever and the movable part of the vehicle, substantially as herein shown and described.



4. In a brake mechanism, the combination with a vehicle-body longitudinally movable relatively to the wheels, of an expansible collar loosely mounted on the hub of one of the wheels, a cord or chain wound around the said collar and having one end connected to the vehicle-body and its other end adapted to have a pull exerted thereon to compress the collar on the hub of the wheel, a pivoted brake-lever, and a connection between the brake-lever and body, substantially as described.

5. In a brake mechanism, the combination with a wheel-supported frame, of a vehicle-body mounted to slide longitudinally on said frame, an expansible collar loosely mounted on the hub of one of the wheels, a cord or chain wound around the said collar and having one end secured to the body, the other end of the said cord or chain being adapted to have a pull exerted thereon to compress the collar into frictional engagement with the hub, springs for pressing the body forwardly and rearwardly, a pivoted brake-lever, and a connection between the brake-lever and body, substantially as described.

6. In a brake mechanism, the combination with a wheel-supported frame, of the body fitted to slide longitudinally on said frame, an expansible collar loosely mounted on the hub of one of the wheels, a cord or chain wound around the collar and having one end secured to the body, the other end of the cord or chain being adapted to have a pull exerted thereon to compress the collar into engagement with the hub, a sliding rod on the under side of the body, springs on said rod and serving to press the body forwardly and rearwardly, and a pivoted brake-lever having one end pivoted to the sliding rod, substantially as herein shown and described.



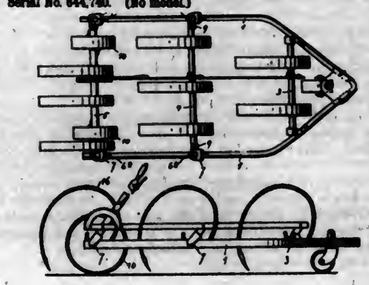
7. A brake mechanism for vehicles, comprising an expansible collar mounted to rotate loosely on one of the rotating parts of the vehicle, a flexible connection extending around said loose collar to compress the same and bring it into frictional engagement with the said rotating part, a draft-receiving device to which one end of said connection is secured, a vehicle-body movable longitudinally of the vehicle relatively to the wheels, the other end of the flexible connection being connected to said movable body, and a brake actuated by the movement of the body, substantially as described.

604,287. MORTAR-HOD. WILLIAM G. AVERY, Cleveland, Ohio. Filed Aug. 3, 1894. Serial No. 519,770. (No model.)

Claim.—As an improved article of manufacture, a triangular-shaped mortar-hod made up of a single blank of sheet metal substantially rectangular with one end extended at either side at obtuse angles with the side edges and having a triangular central section terminating in a flap, said blank being bent transversely near the aforesaid end, then bent upon its longitudinal center and the said triangular central section bent inward upon the inclined sides to form a transverse wall between said sides, after which the triangular portions or flaps extending beyond the wall are bent upon the latter and the flap or upper end of said wall turned over the upper edges of the aforesaid flaps, as herein shown and described.

604,288. HARROW. HENRY D. BABCOCK, Leonardsville, N. Y., assignor, by mesne assignments, to the National Harrow Company, Utica, N. Y. Filed Dec. 6, 1894. Serial No. 531,067. (No model.)

Claim.—1. In a sectional harrow the following elements in combination: draft-bars parallel in portions of their length deflected upwardly at their front ends; a wearing or reinforcing shoe conforming to the angle of the draft-bars; turnable tooth-bars and lever-operating mechanism for the purposes stated.



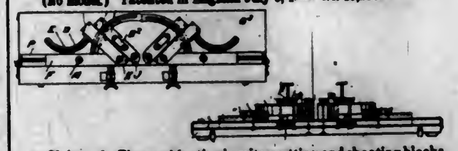
2. In a sectional harrow the following elements in combination: parallel draft-bars in portions of their length; turnable tooth-bars at substantially right angles to the draft-bars; tooth-bar sockets or clips secured at one end to the draft-bars and provided with tooth-bar sockets at their free ends and arms carried by the tooth-bars and overlapping said clips for holding the tooth-bars from end thrust, and lever mechanism for operating the turnable tooth-bars as set forth.

3. The combination in a harrow, of turnable tooth-bars, draft bars or runners integral in their length, the inner draft-bars deflected at their rear into a plane above the other portions of the draft bars or runners, substantially as described.

4. In a harrow, the combination of turnable tooth-bars, draft-bars provided with tooth-bar sockets rigidly secured thereto, and clips secured to the tooth-bars and arranged to overlap portions of the tooth-bar sockets on the outer sides thereof, substantially as described.

5. In a metal-frame harrow, the combination of draft-bars parallel in portions of their length and deflected at their front into engagement with a nose-piece to which they are rigidly secured, and the nose-piece, substantially as described.

604,289. HARROW. HENRY D. BABCOCK, Leonardsville, N. Y., assignor to the Standard Harrow Company. Filed July 15, 1897. Serial No. 644,740. (No model.)



Claim.—1. In a spring-tooth harrow having side or draft bars with tooth-bars running substantially at right angles to the line of draft, and wheels mounted on the rear bar of the harrow and running parallel with the teeth, whereby the rear of the harrow is carried in a given horizontal plane, substantially as set forth.

2. The combination with the rear bar of a spring-tooth harrow and the wheel mounted thereon, by means of which the rear of the harrow is always carried in a given horizontal plane for the purposes stated, substantially as set forth.

3. In a lever spring-tooth harrow, the combination with the rear tooth-bar located substantially at right angles to the line of draft, a wheel-bearing box mounted on the rear tooth-bar and a wheel running thereon, substantially in the direction of the line of draft, whereby the rear of the harrow is carried in a given horizontal plane for the purposes stated.

4. In a lever spring-tooth harrow, the combination therewith of the rear tooth-bar of I-beam steel located substantially at right angles to the line of draft, a wheel-bearing box having a shoulder surrounding the rear tooth-bar and a wheel mounted thereon to run in the direction of the line of draft for the purposes stated.

604,290. MITER CUTTING AND SHOOTING BLOCK. WILLIAM O. BAILEY, London, England. Filed Dec. 24, 1897. Serial No. 663,294. (No model.) Patented in England July 8, 1896 No. 13,368.

Claim.—1. The combination in miter cutting and shooting blocks, of a bed-plate formed with a raised platform, a pair of guide-blocks pivoted to the raised platform, a pair of quadrantal slotted plates in which the bolts attached to the guide-blocks work for adjusting the said guide-blocks, a pair of auxiliary guide-blocks mounted on a pair of sliding blocks, and a pair of quadrantal slotted plates for adjusting said auxiliary guide-blocks substantially as described.

2. The combination in miter cutting and shooting blocks, of a bed-plate formed with a raised platform, a pair of guide-blocks pivoted to the raised platform, a pair of quadrantal slotted plates in which the bolts attached to the guide-blocks work for adjusting the said guide-blocks, a pair of auxiliary guide-blocks mounted on a pair of sliding blocks, a pair of quadrantal slotted plates for adjusting said auxiliary guide-blocks, and a pair of horizontal clamps mounted in or upon the base-plate substantially as specified.

3. The combination, in miter cutting and shooting blocks, of a bed-plate formed with a raised platform, a pair of guide-blocks pivoted to the raised platform, a pair of quadrantal slotted plates in which the bolts attached to the guide-blocks work for adjusting the said guide-blocks, a pair of auxiliary guide-blocks mounted on a pair of sliding blocks, a pair of quadrantal slotted plates for adjusting said auxiliary guide-blocks, a pair of horizontal clamps, mounted in or upon the base-plate, and a pair of cooperating vertical clamps, substantially as specified.

4. The combination, in miter cutting and shooting blocks, of a bed-plate, carrying the guide-blocks, auxiliary guide-blocks and quadrantal slotted plates as described, a circular-saw bench, grooves and runners, and rollers, adapted and arranged substantially as described.

604,291. MITER CUTTING AND SHOOTING BLOCK. WILLIAM O. BAILEY, London, England. Filed Dec. 24, 1897. Serial No. 663,295. (No model.) Patented in England Aug. 11, 1894, No. 15,322.

Claim.—1. In a miter cutting and shooting block, the combination with a bed-plate of a raised platform carrying a pair of adjustable guide-blocks, a pair of auxiliary guide-blocks carried by slotted blocks capable of sliding in slots or guides formed in or upon the raised platform, substantially as specified.

2. In a miter cutting and shooting block, the combination with a bed-plate, of a raised platform carrying a pair of adjustable guide-blocks with the auxiliary means described for securing same in position, a pair of auxiliary guide-blocks carried by slotted blocks capable of sliding in slots or guides in or upon the raised platform, substantially as described.

3. In a miter cutting and shooting block, the combination, with a bed-plate having a raised platform carrying a pair of adjustable guide-blocks adapted to be fixed in position as described, of a pair of auxiliary guide-blocks carried by slotted blocks capable of sliding in slots or guides formed in or upon the edge of the raised platform, and a removable platform adapted and arranged substantially as described.

4. In a miter cutting and shooting block, the combination of a bed-plate with raised platform, a pair of adjustable guide-blocks adapted to be fixed as described, a pair of auxiliary guide-blocks mounted upon a pair of slotted blocks adapted to slide in slots or guides, a removable platform and adjustable springs for securing the material while being cut, substantially as specified.

604,292. WASHING-MACHINE. JAMES S. BEATTY, Simpsonville, Ky. Filed June 19, 1897. Serial No. 641,474. (No model.)

Claim.—1. In a washing-machine, the combination with a supporting-frame, of bearings formed thereon, a shaft held in said bearings, a sprocket-wheel formed upon said shaft, a crank held upon the same, a swinging frame supported upon said shaft, a roller held to rotate in said swinging frame near the end thereof, a similar roller rotatably mounted in said frame and held to rotate therein, gears connecting the said rollers, springs to normally hold said rollers together, a sprocket mounted upon one of said rollers, and a chain connecting said sprocket with the first-mentioned sprocket, substantially as described.

2. In a washing-machine, the combination with a pair of arched supporting-bars having a series of spaced holes near the ends thereof, of rods connecting said bars, adjustable supports held upon said bars adapted to be attached thereto at any of said openings, bearings formed upon said arched bars, a shaft extending across said bearings, a sprocket mounted upon said shaft, a crank held upon the same, a swinging frame held upon said shaft, a roller mounted to rotate in said swinging frame at the lower end of said shaft, a similar roller slidably mounted in said frame and adapted to rotate therein, gears connecting said rollers, a sprocket formed upon one of said rollers, and a chain connecting the said sprocket with the sprocket upon the shaft, substantially as described.

604,293. PRINTING-PRESS. HENRY F. BECHMAN, Battle Creek, Mich., assignor to the Duplex Printing Press Company, same place. Filed May 12, 1897. Serial No. 636,165. (No model.)

Claim.—1. The combination of the reciprocating carriers and the gripper cylinder journaled thereon; with an extensible and contractible reciprocating feed mechanism adapted to feed sheets to the cylinder for the purpose and substantially as described.

2. The combination in a printing-press of a reciprocating impression gripper-cylinder, a stationary sheet-supply, and a reciprocating feed mechanism having one part connected to and reciprocating horizontally with the cylinder and adapted to take sheets from the stationary table and deliver them to the cylinder as it travels.

3. The combination with a pair of reciprocating gripper-cylinders, and a stationary feeding mechanism, of a secondary feed mechanism having one part connected to and reciprocating with the cylinders and adapted to transfer sheets from the stationary feed to the moving cylinders, substantially as and for the purpose set forth.

4. The combination in a printing-press of a pair of reciprocating carriers and impression-cylinders mounted thereon and a stationary sheet-supply; with a feed mechanism having one part attached to the carriers and another part to the frame, and adapted to take sheets from the stationary supply and deliver them to the cylinders while moving, substantially as and for the purpose described.

5. In a printing-press the combination of a pair of reciprocating oscillating impression-cylinders, and a pair of oppositely-reciprocating type-beds, with a reciprocating feed mechanism moving with the cylinders, and adapted to take sheets automatically severed from the web, or otherwise delivered thereto, and deliver them to one of the impression-cylinders as it travels, and means for transferring sheets from one cylinder to the other, substantially as described.

6. The combination of the reciprocating carriers and the cylinder journaled thereon; with an extensible and contractible feed mechanism adapted to feed sheets to the cylinder, said mechanism being so connected to the carriers that it can be detached therefrom and swung up out of the way when making ready the press, all substantially as and for the purpose set forth.

7. In a printing-press the combination of a reciprocating type-bed, or pair of reciprocating type-beds, with a pair of oppositely-reciprocating oscillating impression-cylinders so arranged that sheets printed on one side upon one of the cylinders may be directly transferred to the other cylinder and printed on the other side, with a feeding mechanism reciprocating with the cylinders and adapted to take sheets automatically severed from the web, or otherwise delivered thereto, and deliver them to one of the impression-cylinders as it travels.

8. In a printing-press the combination of a reciprocating type-bed with a pair of oppositely-reciprocating oscillating gripper impression-cylinders, so arranged and actuated by suitable mechanism that sheets printed on one side upon one cylinder may be directly transferred to the other cylinder and printed on the other side.

9. The combination of a pair of reciprocating, oscillating cylinders, and a stationary mechanism for feeding a web and severing it into sheets; with an extensible and contractible feed mechanism substantially as described, adapted to take the sheets from the cutting mechanism and deliver them to the nearest cylinder while it travels, and means for transferring sheets from one cylinder to the other for the purpose and substantially as described.

10. The combination of a pair of reciprocating carriers, a pair of oscillating cylinders journaled thereon, and means for transferring sheets from one cylinder to the other; with guide-fingers and tape-guide rollers mounted on the carriers and moving with the cylinder; a stationary sheet-feeding mechanism mounted on the main frame, tape-guide rollers beside said sheet-feeding mechanism; and a system of endless tapes for carrying sheets from the stationary tape-guide rollers to the guide-rollers on the carriers, and mechanism for looping the tapes in proper manner to compensate for the movement of the carriers, all substantially as and for the purpose set forth.

11. The combination of a reciprocating oscillating impression-cylinder; a set of tape rollers and guides connected to and moving with the cylinder, adapted to deliver sheets thereto, and a set of

tape-rollers mounted on the frame, with endless tapes extending from the stationary rollers to the movable rollers for carrying sheets from the former to the latter, and guides, and means for looping said tapes so as to compensate for the movement of the movable rollers, for the purpose and substantially as described.

12. In a feed mechanism for printing-presses, the combination of a reciprocating impression-cylinder, guide-fingers and tape-rollers connected to and moving with the cylinder, tape-rollers mounted on a stationary support adapted to receive sheets of paper; endless tapes for carrying sheets from the stationary to the movable tape-rollers; and rollers movable with the cylinder carriers and actuated by the latter, and forming loops in the endless tapes compensating for the travel of the cylinder, all substantially as and for the purpose described.

13. The combination in a printing-press of a pair of reciprocating carriers and impression-cylinders mounted thereon and a stationary sheet-supply; with a feed mechanism adapted to take sheets from the stationary supply and deliver them to the cylinders while moving; said feed mechanism being so connected to the carriers that it can be detached therefrom and swung out of the way when making ready, all substantially as and for the purpose set forth.

14. The combination of a reciprocating oscillating cylinder, a reel traveling with the cylinder, having grippers adapted to take the sheet from said cylinder, and the systems of endless tapes moving with the reel and cylinder for delivering the printed sheets, substantially as and for the purpose described.

15. In a printing-press the combination of type-beds, a pair of cylinders, screws and rack-bars for raising and lowering said cylinders, a pinion engaging the rack-bar, a sliding rack engaging the pinion, and means for shifting said rack, for the purpose and substantially as described.

16. The combination of an impression-cylinder, a screw for throwing said cylinder on or off impression, and a sliding bar having a rack engaging a pinion on the screw; with a movable rack-bar, a pinion meshing with said rack-bar and with a rack on the lower edge of said sliding bar, and mechanism for shifting the lower rack-bar for the purpose and substantially as described.

17. The combination of a reciprocating cylinder carrier and a cylinder mounted thereon, a screw for raising and lowering the cylinder having a pinion; and a sliding rack-bar engaging said pinion; with an adjustable rack supported on the frame of the machine, a pinion meshing with said adjustable rack and with teeth on said rack-bar, means for lineally moving said pinion, and means for shifting the adjustable rack so as to compel the pinion to shift the rack-bar, for the purpose and substantially as described.

18. In a printing-press the combination of type-beds; a pair of reciprocating carriers; a pair of cylinders mounted on said carriers; a fixed and a sliding rack-bar mounted on the carrier; and means operated by the movable rack, for alternately throwing said cylinder on and off impression; with a fixed and movable rack on the frame; a pair of pinions interposed between said pairs of racks; and means for shifting the lower movable rack-bar so as to cause the pinion meshing therewith and with the upper movable rack-bar, to shift the latter, for the purpose and substantially as described.

19. In a printing-press the combination of a pair of reciprocating carriers, a pair of oscillating cylinders mounted thereon; screws for raising and lowering said cylinders, provided with pinions; a sliding rack-bar meshing with said pinions and having a rack on its lower edge; a fixed rack also mounted on the carrier beside the movable rack; a fixed and a movable rack lying below the carrier-racks; a pinion meshing with both said fixed racks; a loose pinion meshing with both said movable racks; and means for shifting the lower movable bar, all substantially as and for the purpose set forth.

20. The combination of a reciprocating carrier, a cylinder mounted thereon, a rotatable screw for raising and lowering said cylinder, a sliding rack-bar for rotating said screw, and a fixed rack-bar beside the sliding rack-bar, all mounted on the carrier; with a stationary rack-bar and an adjustable rack-bar mounted on the frame; a pair of pinions mounted loosely on a stub-shaft and respectively meshing with the fixed and stationary rack-bars, and the sliding and adjustable rack-bars, and means for shifting said adjustable rack-bar, all substantially as and for the purpose set forth.

21. In a printing-press the combination of type-beds, a pair of oscillating bars, a pair of cylinders mounted on opposite ends of said bars, screws and rack-bars for oscillating said bars, a pinion engaging the rack-bar, a sliding rack engaging the pinion, and means for shifting said rack, for the purpose and substantially as described.

22. In a printing-press the combination of type-beds; a pair of oscillating bars mounted on reciprocating carriers; a pair of cylinders mounted on opposite ends of said bars; with a fixed and a sliding rack-bar mounted on the carrier; and means operated by the movable rack, for oscillating said bars; a fixed and movable rack on the frame; a pair of pinions interposed between said pairs of racks; and means for shifting the lower movable rack-bar so as to cause the pinion meshing therewith and with the upper movable rack-bar, to shift the latter, for the purpose and substantially as described.

23. In a printing-press the combination of a pair of reciprocating carriers, oscillating cylinder-supporting bars mounted thereon; screws for oscillating said bars, provided with pinions; a sliding rack-bar meshing with said pinions and having a rack on its lower edge; a fixed rack also mounted on the carrier beside the movable rack; a fixed and a movable rack lying below the carrier-racks; a pinion meshing with both said fixed racks; a loose pinion meshing with both said movable racks; and means for shifting the lower movable bar, all substantially as and for the purpose set forth.

24. The combination of a pair of type-beds, a pair of reciprocating carriers, an oscillating bar on each carrier, and a pair of cylinders journaled in said oscillating bars; screws for oscillating said bars, pinions on the screws, a rack-bar on each carrier engaging the screw-pinions and having a rack on its lower edge also; and a fixed rack on each carrier beside the movable rack; with a fixed and a movable rack mounted on the frame below the carrier; a sliding plate mounted in guides and provided with a stub-shaft overlying the lower racks; a pair of pinions on said sub-shaft respectively meshing with the upper and lower fixed racks, and the upper and lower movable racks, and means for shifting said lower movable rack, all substantially as and for the purpose set forth.

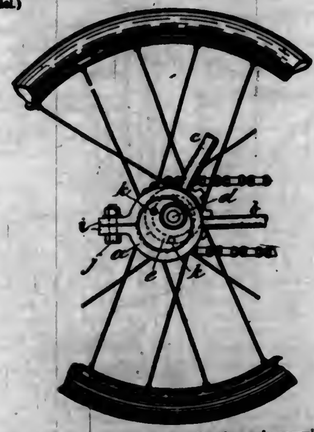
25. The combination with the reciprocating cylinder, the sheet-guide fingers traveling therewith, and the tape-guides J^3, J^3 also moving with the cylinder; the stationary tape-guides J', J^4, and the endless carrier-tapes J, running over rollers J', J^3, J^3, J^4, all for the purpose and substantially as described.

26. The combination with the reciprocating cylinder, the sheet-guide fingers traveling therewith, and the tape-guides J^3, J^3, also moving with the cylinder; the stationary tape-guides J', J^4, and the endless carrier-tapes J, running over rollers J', J^3, J^3, J^4; with the tape-guides j^3, j^3 also moving with the cylinder, the stationary guides j', j^4, and the endless tapes j running over guides j', j^3, j^3, j^4, all substantially as and for the purpose described.

27. The combination with the cylinder and its reciprocating carriers, the sliding bars detachably connected to the carrier, and the castings supporting said bars pivoted on the main frame, with the tape-guides J^3, J^3, j^3, j^3, mounted on said bars; and the tape-guides J', J^4, j', j^4, mounted on said castings, the endless tapes J running over guides J', J^3, J^3, J^4, and the endless tapes j running over guides j', j^3, j^3, j^4, all substantially as and for the purpose described.

28. The combination of a pair of type-beds, a pair of oscillating gripper impression-cylinders arranged side by side, and respectively operating on the beds; with mechanism for delivering a sheet to the gripper of the first impression-cylinder; mechanism for causing the grippers of the first cylinder to release the sheet when it has made one revolution, mechanism for causing the grippers of the second cylinder to catch the sheet as it is released from the first cylinder, and to release it after it is perfected; and means for throwing the cylinders off and on impression alternately so that they print only on the proper beds and on alternate strokes, all substantially as and for the purpose set forth.

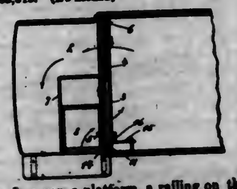
29. The combination of a pair of type-beds, a pair of reciprocating oscillating impression-cylinders arranged side by side, and mechanism for throwing the cylinders alternately on and off impression so that they print on alternate strokes; with mechanism for feeding a sheet of paper to the first cylinder at a point between the cylinders, during the back stroke thereof, mechanism for shifting the grippers on the cylinders when they are at the end of their back stroke so that the first cylinder releases the sheet while the second cylinder catches it, and mechanism for taking the sheet from the second cylinder, all substantially as and for the purpose described.



30. The combination of the reciprocating carriers, the cylinder journaled thereon; the bars detachably fastened to the carriers, the reel mounted on said carriers provided with grippers adapted to strip a sheet from said cylinder; and the system of tape-guides and tapes carried by said bars for delivering the printed sheets from the reel, all substantially as and for the purpose described.

31. The combination of the reciprocating cylinder, the reel mounted above the same and traveling therewith provided with gripper-fingers adapted to strip the sheets from the cylinder; and the upper and lower sets of endless tapes for delivering the sheets from the roll, the lower tapes running around the reel, and means for driving said reel and tapes independently of the cylinder, substantially as and for the purpose set forth.

32. The combination of the reciprocating carriers, the cylinder journaled therein, the reel moving with the carriers and provided with grippers adapted to take the sheets from the cylinder; with the telescopic shaft, one section thereof being journaled in bearings on the carriers and driving the reel by bevel-gearing, and the other section thereof being journaled in a stationary bearing and driven by gearing, substantially as and for the purpose described.



33. In a printing-press the combination of a pair of beds, a pair of reciprocating carriers, and a pair of cylinders respectively cooperating with the beds, with a sheet-feeding mechanism moving with the carriers adapted to supply sheets to the cylinders while they are traveling, and a delivery mechanism also moving with the carriers and adapted to remove the sheets while the cylinders travel, said movable feed and delivery mechanisms being respectively detachable from the carriers at will, so that they can be moved back out of the way when making ready the press, all substantially as and for the purpose described.

604,294. CHAIN ADJUSTMENT FOR BICYCLES. CHARLES W. BENSON, New York, N. Y., assignor to the Benson Manufacturing Company, same place. Filed Dec. 28, 1896. Serial No. 617,197. (No model.)

Claim.—In an eccentric chain-adjusting axle-carrying device for the driving-wheel in a bicycle, the combination of ring-terminals of the bind forks of the frame, said rings being parted for opening and provided with suitable lugs and a device for clamping them together, a disk fitted and adapted to be clamped in each terminal ring and being ribbed and grooved therein for resisting lateral displacement and also being eccentrically perforated for the axle, the axle inserted in the disks and clamped at the ends therein respectively, and the wheel mounted on the axle between said disks, substantially as described.

604,295. FARE-REGISTER-OPERATING MECHANISM FOR CARS. CHARLES BERGSTEIN, New York, N. Y. Filed Jan. 6, 1898. Serial No. 666,813. (No model.)

Claim.—1. In a car, a platform, a railing on the platform embracing one of a pair of doors for the car, a swinging section for the platform and within the space embraced by said railing and connections between said swinging section and a fare-register in the car whereby the register will be operated by a downward pressure of the swinging section, substantially as specified.

2. In a car, a platform, a railing on the platform embracing one of a pair of doors for the car, a swinging section for the platform within the space embraced by said railing, a draw-rod having connection with the swinging section, a rock-shaft operated by the draw-rod, and a finger extended from the rock-shaft and adapted to operate the lever of a fare-register, substantially as specified.

3. A car having two sliding doors at its end, one of said doors having a handle on its outer side and the other having a handle on its inner side, a railing on the car-platform for directing a passenger to one of the doors, a swinging platform-section within the space embraced by the railing, means operated by said swinging section to operate a fare register, and a spring supporting the swinging section, substantially as specified.

604,296. COMBINATION PUSH-BUTTON CARD RECEIVER AND EJECTOR. OBADIAH M. BOSSERT, Oakmont, Pa. Filed June 21, 1897. Serial No. 641,630. (No model.)

Claim.—1. The combination with the bell-actuating mechanism, of the card-receptacle, mechanism for ejecting the cards therefrom, a casing inclosing said bell-actuating mechanism and card-ejecting mechanism, said receptacle being open at one end for permitting the insertion and removal of cards, and an operative connection between the bell-actuating mechanism and the card-ejecting mechanism whereby they are operated simultaneously, substantially as described.

2. The combination with the bell-actuating mechanism, of the divided card-receptacle, mechanism for partially ejecting the cards therefrom, a casing inclosing said bell-actuating mechanism, card-receptacle and card-ejecting mechanism, said receptacle being open at its forward end for permitting the insertion and removal of cards, and an operating connection between the bell-actuating mechanism and the card-ejecting mechanism, whereby they are operated simultaneously, substantially as described.

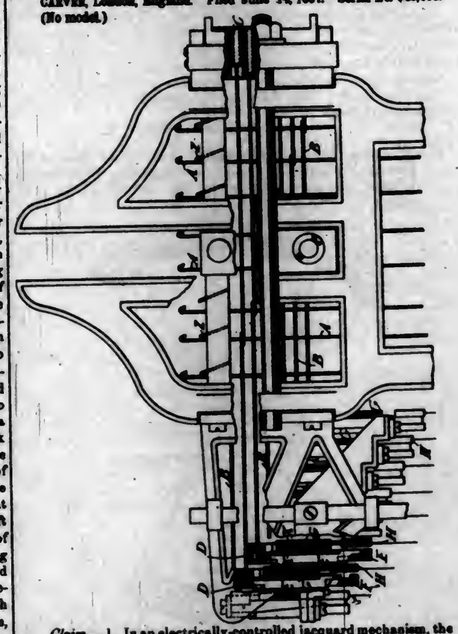
604,297. TIMEPIECE. JOHN C. BURKE, Middleborough, Ky. Filed Aug. 21, 1896. Serial No. 603,507. (No model.)

Claim.—1. In a timepiece, the combination with the driving and time-indicating mechanism, of a calendar mechanism comprehending dials and hands or pointers for indicating the days of the week and the days of the month, toothed wheels mounted on the arbors of said hands, one of said wheels having teeth corresponding in number with the days in a week, and the other having teeth corresponding in number with the days in a month, a wheel located between said toothed wheels and geared with the driving and time-indicating mechanism to make one rotation in twenty-four hours, and carrying two tappet-arms one of which engages and operates one of said toothed wheels, and the other arm the other of said wheels, a month-indicating disk, a toothed wheel for operating the same, a year-indicating disk, a toothed wheel for operating the same, connections between the wheels having teeth corresponding in number with the days of the month and the said wheels for operating the month and year indicating disks, a sun-dial, a moon-dial, toothed wheels for operating the same, and connections between the driving mechanism and the last-mentioned toothed wheels, whereby the said hands or pointers are each advanced one step at each rotation of said tappet-wheel.

2. In a timepiece, the combination with the driving and time-indicating mechanism, of a calendar mechanism comprehending four dials and rotary indicators operating in connection therewith to indicate, respectively the day of the week, the day of the month, the date, respectively the day of the week, the day of the month, the month, and the year, of a tappet-wheel geared with the time mechanism to make one rotation in twenty-four hours, the tappet-arms

thereof standing in different planes of rotation, toothed wheels mounted on the arbors or spindles of the indicator for the day of the week and the day of the month, adapted to be operated by the respective tappet-arms, a toothed wheel on the arbor or spindle of the year-indicator, and a twelve-toothed wheel on the arbor of the month-indicator, the last-named wheel having a tappet to operate the toothed wheel of the year-indicator, a tappet-wheel geared, and rotating synchronously, with the first-named tappet-wheel to operate the month-indicator, a sun-dial, a moon-dial, toothed wheels for operating the same, and connections between the driving mechanism and the last-mentioned wheels, all operating together as and for the purpose set forth.

3. In a timepiece, the combination with the main driving mechanism, of a dial for indicating mean solar time having a hand or pointer centrally mounted upon a suitable shaft, a series of smaller supplemental dials for indicating the time in different time-sections, hands or pointers for each of said supplemental dials mounted upon suitable shafts, pinions upon the lower ends of said shafts meshing with one another through suitable intermediate pinions, a train of gearing for rotating said hands in the same direction and at the same speed directly from said main driving mechanism, a dial for indicating the days of the month, a hand or pointer therefor, a shaft upon which said hand or pointer is mounted, a disk or wheel secured to said shaft having a series of thirty-one radially-extending teeth thereon, a cog-wheel meshing with one of the pinions on the lower end of the shaft upon which the hands of the solar disk are mounted, so geared as to make a complete rotation once in twenty-four hours, a projecting lug or arm on said cog-wheel adapted to engage said disk once during each complete revolution thereof, a circular dial-plate for indicating the different months of the year, having the names of said months printed or otherwise impressed upon the upper surface of said plate adjacent to its outer edge adapted to be visible one at a time through an opening in the face-plate of the device, a shaft upon which said plate is mounted, a disk or wheel having a series of twelve teeth thereon secured to said shaft, an idle-pinion meshing with a similar pinion of the same size on the shaft to which said thirty-one-toothed disk is mounted, an arm or projection on said idle-pinion adapted to engage the twelve-toothed disk once during each revolution of said idle-pinion, a dial for indicating different years, having printed or otherwise impressed upon the upper surface thereof adjacent to its outer edge different years in succession, capable of being visible one at a time through a second opening in the face-plate of the device, a shaft upon which said dial-plate is mounted, a disk having a series of teeth thereon equal in number to the number of different years printed upon said dial-plate, and a lug or projection on said twelve toothed disk adapted to engage one of the teeth on the toothed disk connected to said year dial-plate once during each revolution of the former, substantially as and for the purpose described.

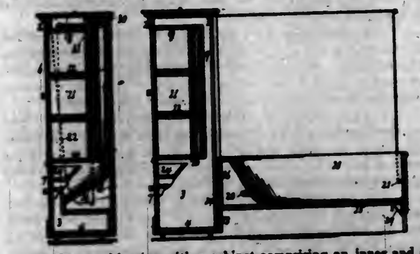


604,298. BELT. HEINRICH CAROLI, Lahr, Germany. Filed Sept. 3, 1896. Serial No. 604,732. (No model.)

Claim.—1. The combination of a belt *a*, two buckles *f*, *l*, secured upon said belt, a strap *g* extending from one end of said belt and adapted to be secured by buckle *l*, a bipartite strap *d* extending from the other end of said belt and united at *d'* to be secured by buckle *f* and an independent wire bow *k* having eyes for the passage of the parts of strap *d* and having a bar midway of said eyes adapted to lie in the bight of strap *g*.

2. The combination of belt *a* formed of two parts, each having at one end lace-holes, laces for attaching said parts by means of said lace-holes, buckles *f*, *l*, secured respectively upon the two parts of said belt, a strap *g* extending from one end of the belt, a bipartite strap *d* extending from the other end of said belt, and a wire bow *k* having eyes for the passage of the parts of strap *d* and having a bar midway of said eyes adapted to lie in the bight of strap *g*, said straps *d* and *g* being adapted to be secured by the buckles *f* and *l* respectively.

604,299. JACQUARD MECHANISM FOR LOOMS. THOMAS A. B. CARVER, London, England. Filed June 14, 1897. Serial No. 640,660. (No model.)

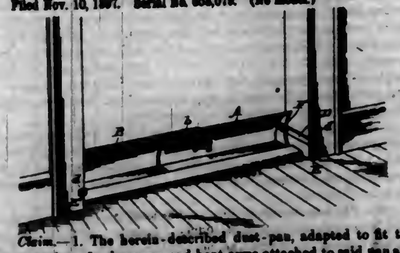


Claim.—1. In an electrically-controlled jacquard mechanism, the combination with a plurality of vertically-movable hooks, horisontal needles connected therewith and operating to throw said hooks into and out of operation to determine the pattern, and the vertically-reciprocating knife, of vertically-movable keepers arranged to be projected into the path of the needles, electromagnets, one for each keeper, arranged to attract and hold the keepers in the path of the needles, electric circuits controlling said magnets, circuit making and breaking mechanism, and a pattern sheet for opening and closing said circuits to energize and demagnetize the said magnets and thus throw the hooks into and out of operation at predetermined intervals, substantially as described.

2. In an electrically-controlled jacquard mechanism, the combination with a plurality of vertically-movable hooks, horisontal needles connected therewith and operating to throw said hooks into and out of operation to determine the twill of the fabric, and the vertically-reciprocating knife, of vertically-movable keepers arranged to be projected into the path of the needles, electromagnets, one for each keeper, arranged to attract and hold the keepers in the path of the needles, electric circuits controlling said magnets, and a commutator constructed to make and break said circuits progressively in a predetermined order, substantially as described and for the purpose specified.

3 In an electrically-controlled jacquard mechanism, the combination with a plurality of vertically-movable hooks, horizontal needles connected therewith and operating to threw said hooks into and out of operation, and the vertically-reciprocating knife, of vertically-movable keepers arranged to be projected into the path of the needles, electromagnets, one for each keeper, arranged to be energized and hold said keepers in the path of the needles, two electric circuits for each magnet and arranged when closed to neutralize each other and demagnetize the magnet, a circuit making and breaking mechanism and a pattern-sheet for controlling said mechanism to open and close said circuits, and a commutator constructed to make and break the other circuit at predetermined intervals, substantially as described for the purpose specified.

604,300. CABINET-BATH. VALDEMAR CHRISTENSEN, New York, N. Y. Filed July 1, 1897. Serial No. 643,139. (No model.)



Claim.—1. The combination with a cabinet comprising an inner and an outer shell concentrically arranged with an intervening space between their four sides, said shells being fixed relatively one to the other, the inner shell being closed at its back and open at its front, and the outer shell open at its back and provided in its front with a door controlling the communication with the inner shell, of a bath-tub hinged at the lower edge of its head portion to the bottom of the outer shell and arranged to be swung or folded into the space between the inner and outer shells, and a door hinged in the lower portion of the front of the outer shell and provided on its inner face with a receptacle arranged to project into the head portion of the tub when the latter and the tub are closed, substantially as described.

2. The combination with a cabinet comprising an inner and an outer shell concentrically arranged with an intervening space between their four sides, said shells being fixed relatively one to the other and the outer shell open at its back, of a bath-tub hinged at the lower edge of its head portion to the bottom of the outer shell and arranged to be swung or folded into the space between the inner and outer shells, means for gaining access to the interior of the inner shell from the front of the cabinet, a rod pivoted at one end to the side of the foot of the tub and adapted to fold between the side of the tub and the side of the outer shell when the tub is raised up, and a flexible connection attached to the free end of the rod and to the upper end of the cabinet, substantially as described.

3. The combination with a cabinet comprising an inner and an outer shell concentrically arranged with an intervening space between their four sides, said shells being fixed relatively one to the other and the outer shell open at its back, of a bath-tub hinged at the lower edge of its head portion to the bottom of the outer shell and arranged to be swung or folded into the space between the inner and outer shells, means for gaining access to the interior of the inner shell from the front of the cabinet, a discharge-spout provided with a valved faucet flexibly connected to the tub, and a slot formed in the side of the tub and adapted to be engaged by the faucet-handle to hold the faucet in position to be folded with the tub into the said outer shell, substantially as described.

604,301. DUST-PAN. KATE A. CLABAUGH, Martinsburg, Pa. Filed Nov. 10, 1897. Serial No. 658,079. (No model.)

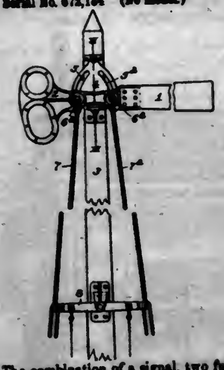
Claim.—1. The herein-described dust-pan, adapted to fit the lower portion of a doorway, and boot arms attached to said pan and adapted to engage the casing of the doorway, substantially as specified.

2. The herein-described dust-pan, adapted to fit the lower portion of a doorway in the manner described, and formed in two sections adjustably connected to each other, substantially as specified.

3. The herein-described dust-pan adapted to fit the lower portion of a doorway in the manner described, and formed in two sections whose inner end portions are overlapped and slidingly connected to each other, means for securing the adjustment of said sections to vary the length of the pan, and arms connected to the end portions of the pan and adapted to engage the casing of the doorway, substantially as specified.

604,302. WIRE-STRETCHER. LEANDER CLARK, Greenville, Ohio. Filed Dec. 20, 1897. Serial No. 664,941. (No model.)

Claim.—1. A wire-stretcher having parallel separable cheek-plates, one of which carries a bifurcated guide, of which the extremities are stepped in openings in the other cheek-plate, a shouldered drum removably mounted in transversely-alined bearings in the cheek-plates and provided with a wire-receiving bifurcation, a transverse key engaging the drum in contact with the exterior surface of one of the cheek-plates, to prevent relative displacement of the cheek-plates and the accidental dismounting of the drum, while allowing the disconnection of said parts to facilitate the engagement of the drum with a fence-wire, and means for locking the drum against backward rotation, substantially as specified.



2. A wire-stretcher having parallel cheek-plates, a revolubile drum mounted in bearings in the cheek-plates, ratchet mechanism for preventing backward rotation of the drum, and including a pawl, mounted upon one of the cheek-plates, engaging a ratchet on the drum, and a removable locking-pin fitted in an opening in the stretcher-frame in the path of the pawl, to prevent disengagement of the latter from the ratchet, substantially as specified.

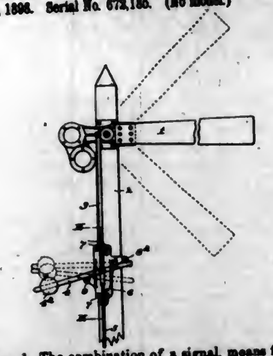
3. A wire-stretcher having parallel cheek-plates and an interposed wire-guide, a revolubile drum mounted in transversely-alined bearings in the cheek-plates and carrying a ratchet, a pawl mounted upon one of the cheek-plates in operative relation with said ratchet and provided with a tail or extension, and a removable locking-pin fitted in an opening in the stretcher-frame to prevent disengagement of the pawl from the ratchet, substantially as specified.

4. A wire-stretcher having parallel separable cheek-plates, bifurcated wire-guides carried by one of the cheek plates and fitted at their extremities in openings in the other cheek-plate, a drum mounted in transversely-alined bearings in the cheek-plates and provided with a ratchet to bear against the outer surface of one of the cheek-plates, said drum being longitudinally slotted to engage a fence-wire, a pin engaging transverse openings in the drum contiguous to the outer surface of the other cheek-plate, to prevent displacement of the drum from its bearings and lock the extremities of the wire-guides in the openings in which they are fitted, and a pawl for engaging the ratchet to prevent accidental backward rotation of the drum, substantially as specified.

604,808. SIGNAL. JOHN P. COLEMAN, Edgewood Park, Pa., assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed Mar. 1, 1898. Serial No. 672,184. (No model.)

Claim.—1. The combination of a signal, two fulcra for said signal and means for shifting the signal on either of the fulcra, substantially as set forth.

2. The combination of a signal, two fulcra supporting the signal on opposite sides of its center of gravity and means for shifting the signal on either of the fulcra, substantially as set forth.

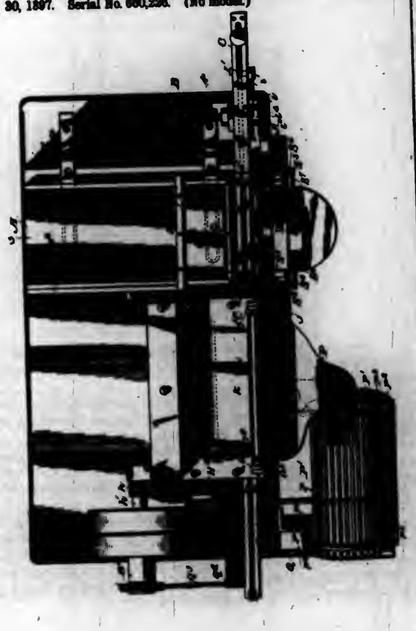


3. The combination of a signal, two fulcra for supporting the signal, means for holding the signal as against longitudinal movement, and means for shifting the signal on either of said fulcra, substantially as set forth.

4. The combination of a signal, two fulcra supporting the signal, a floating lever, fulcra for said lever, a rod connecting the signal and lever at points intermediate of their fulcra, and means for holding the signal on one fulcrum when the lever is shifted in one direction and for holding it against the other fulcrum, when the lever is shifted in the opposite direction, substantially as set forth.

5. The combination of a signal, two fulcra for supporting the signal, a floating lever, fulcra for said lever supported by the signal, and a rod connected to the signal and lever at points intermediate of their fulcrum, substantially as set forth.

6. The combination of a signal, two fulcra for supporting the signal, means for shifting the signal on either fulcra and means rendered operative by the signal when shifted to return it to normal position, substantially as set forth.



604,804. SIGNAL. JOHN P. COLEMAN, Edgewood Park, Pa., assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed Mar. 1, 1898. Serial No. 672,185. (No model.)

Claim.—1. The combination of a signal, means for shifting the signal to clear or caution positions, a weighted lever, fulcra for said lever and a connection from the signal to the lever, whereby the weighted end of the lever is raised when the signal is shifted to either caution or clear positions, substantially as set forth.

2. The combination of a balanced signal, a floating lever having a weight at or near one end, a rod connecting the signal to the lever, fulcra arranged on opposite sides of the point of connection of the rod to the lever, and means for causing the lever to turn on either fulcrum, substantially as set forth.

604,805. MACHINE FOR DISCARDING LEADS, SPACES, AND QUADS FROM DEAD-MATTER. PAUL F. COX, Chicago, Ill., assignor to the Cox Type Setting Machine Company, same place. Filed Nov. 30, 1897. Serial No. 660,236. (No model.)

Claim.—1. The combination of mechanism for discarding spaces and quads from a line of type, and means for feeding a line of type to said mechanism; with means for separating the quads from the spaces after they are removed from the line of type.

2. The combination of mechanism for discarding spaces and quads from a line of type, and means for separating lines of type from dead-matter and feeding them to said mechanism; with means for separating the quads from the spaces after they are removed from the type, substantially as described.

3. The combination with mechanism for discarding spaces and quads from the line of type, and means for feeding lines of type to said mechanism; with mechanism for separating the quads from the spaces after they are removed from the line of type, and means for assembling the discarded quads, substantially as described.

4. The combination of mechanism for separating lines of type from dead-matter, and for discarding the leads therein; with mechanism for subsequently discarding the spaces and quads from the separated lines of type and mechanism for separating the quads from the spaces, substantially as and for the purpose described.

5. The combination of mechanism for discarding the leads from dead-matter and for separating the lines of type therein; with mechanism for subsequently discarding the spaces and quads from the separate lines of type, means for separating the quads from the spaces, and means for assembling the separated quads, substantially as and for the purpose described.

6. The combination of a dead-matter galley having a transverse slot in its rear end, means for forwarding dead-matter in the galley toward said slot, and a lead-holding shelf below the galley; with a reciprocating plate having a ledge on its front face adapted to engage the leads in the dead-matter and pull the same down through said slot when the plunger descends, and a rocker stacking-plate below said slot and between said reciprocating plate and said shelf adapted to remove the leads from the plate and stack them on the shelf; and means for rocking said plate, substantially as described.

7. The combination with a galley having a slot in its rear end, the plunger-plate adapted to lower leads from the galley through said slot, provided with vertical grooves, and a rocking stacker-plate having fingers adapted to rest in said grooves and strip the leads from the plunger and stack the same in the lead-holder.

8. The combination with a galley having a slot in its rear end, a lead-holding shelf below the galley and the plunger having a plate adapted to lower leads from the galley through said slot, and provided with vertical grooves; with a rocking stacker having fingers adapted to rest in said grooves and strip the leads from the plunger and stack the same on the shelf, and mechanism for operating said stacker, substantially as described.

9. The combination of a dead-matter galley having a transverse slot in its rear end, a lead-holding shelf below the galley, a type-channel above the slot therein, and means for forwarding dead-matter in the galley toward said slot, with a vertically-grooved reciprocating plate having a ledge on its front face adapted to engage the leads in the dead-matter and pull the same down through said slot into the type-holder when the plate descends, and adapted when it ascends to lift the line of type into the type-holder, and a rocking stacker-plate below said slot having fingers adapted to engage the grooves of the stacker and remove the leads from the plate and stack them on the shelf, substantially as described.

10. The combination of the type-line holder, and a series of parallel independently-removable sliding ejectors provided with feelers; with means for positively actuating any ejector that has found a space or quad to cause it to eject the same from the line, substantially as described.

11. The combination of the type-line holder, and a series of parallel independently-removable sliding ejectors; with a gyratory pusher adapted to engage and positively actuate any ejector that has found a space or quad to cause it to eject the same from the line, substantially as described.

12. The combination of the type-line holder, and a series of parallel sliding ejectors provided with feelers: with means for positively actuating any ejector that has found a space or quad to cause it to eject the same from the line, mechanism for returning said ejectors to normal position, and means for moving the type-line forward past the ejectors while they are retracted, substantially as and for the purpose described.

13. The combination of the type-line holder, a series of parallel independently-removable sliding ejectors provided with feelers, and a gyratory pusher for positively actuating any ejector that has found a space or quad and to cause it to eject the same from the line, a vibrating controller for returning said ejectors to normal position, and means for moving the type-line forward past the ejectors while they are retracted, substantially as described.

14. The combination of a type-line holder having an opening in its side; a series of parallel sliding ejectors opposite said opening, the grooved guides for said ejectors and springs adapted to push said ejectors toward the opening; with means for withdrawing said ejectors from the slot, and a gyratory pusher adapted to engage any of the ejectors that has found a space or quad and cause it to positively eject the same, substantially as described.

15. The combination of means for holding a line of type, means for tilting spaces or quads from the line, and means for positively knocking out of the line the tilted spaces or quads.

16. The combination of a type-line holder, a series of space-ejectors beside the holder, means for actuating any ejector that finds a space or quad, and a striker adapted to knock out all the spaces or quads tilted over by the ejectors, substantially as described.

17. The combination of a type-line holder, a series of parallel space-ejectors beside the holders having feelers on their ends adapted to press against the type in the holder; and means for actuating any ejector, whose feeler finds a space; with means for holding said ejectors out of the way of the type when the latter is moving in the holder; and a striker-plate adapted to knock out all the spaces or quads tilted over by the ejectors.

18. The combination of a type-line holder, a series of space-ejectors, springs for pressing said ejectors against the type, a controller for holding said ejectors away from the type, except at the moment of their operation; and a striker adapted to positively remove all spaces and quads tilted from the line of type by said ejectors.

19. The combination of a type-line holder, a series of space-ejectors, springs for pressing said ejectors against the type and a controller for holding said ejectors away from the type, except at the moment of their operation; with means for operating any ejector that finds a space, and a movable striker-plate adapted to knock out all spaces and quads tilted from the line of type by said ejectors.

20. The combination of a type-line holder, a series of sliding parallel space-ejectors, a controller for holding the ejectors away from the type except at the moment of their operation, and a gyratory pusher for positively operating any ejector which has found a space or quad; with a striker adapted to positively eject any spaces or quads tilted from the line by the ejectors, all substantially as described.

21. The combination of the type-line holder, a series of parallel sliding space-ejectors, individual springs for pressing each ejector against the type, and a single controller for holding the ejectors away from the type, except at the moment of their operation; with a vertically and laterally movable bar adapted to engage any ejector which has found a space or quad and cause it to positively eject the latter from the line, and a vertically-movable swinging striker adapted to engage any partially-ejected spaces or quads and remove them from the line, substantially as described.

22. The combination of a type-line holder and means for moving the line of type therein, a series of parallel ejectors provided with feelers adapted to engage the type, and springs for pressing said ejectors toward the type, a controller-plate for withdrawing said ejectors from the type except at the moment of their operation and means for operating said plate; with a pusher-bar vertically-movable cam-actuated bars carrying said bar, and the cam-actuated levers engaging said bar and adapted to cause it when lifted to positively operate any ejector which has found a space or quad, for the purpose and substantially as described.

23. The combination of a type-line holder having an opening past which a line of type is passed, ejectors beside said slot adapted to detect and eject spaces and quads from the line of type; with a vertically-movable and laterally-swinging plate adapted to engage any spaces or quads tilted from the line by said ejectors, and positively remove them, for the purpose and substantially as described.

24. The combination with a type line holder and mechanism for tilting spaces or quads from the lines of type therein, with a vertically-movable and laterally-swinging plate, and mechanism for lowering said plate, so as to cause it to engage any spaces or quads tilted from the line of type, and means for causing said plate to swing outwardly when lowered so as to positively eject such spaces and quads.

25. The combination with mechanism for ejecting spaces and quads from a line of type, of means by which the ejected spaces are separated from the quads.

26. The combination with mechanism for ejecting spaces and quads from a line of type, of a rotatable cage-separator into which the ejected spaces and quads are delivered, and by which the spaces are separated from the quads, and a conveyer at the discharge end of said cage into which the quads are delivered, a channel at the lower end of said conveyer, and mechanism for stacking the quads in said channel.

27. The combination of the dead-matter galley, the lead-supporting shelf, and a reciprocating plunger adapted to transfer leads from the galley to the shelf; with a pivoted stacker-plate adapted to strip the leads from the plunger and stack them upon the shelf, a rotary shaft having an eccentric-pin on its end, a vertically-movable rod having a loop in which said pin works, a spring for uplifting said rod, and connections substantially as described between the upper end of said rod and said stacker, substantially as described.

28. The combination of the galley, a reciprocating plunger for removing lines of types therefrom, an oscillating lever for operating said plunger, a bifurcated slide-bar engaging said lever, a grooved cam for operating said bar mounted upon a rotatable shaft, and a guide for said slide, substantially as and for the purpose described.

29. The combination of the galley, means for forwarding "dead-matter" therein, a reciprocating plunger for removing lines of type therefrom, and an oscillating lever for operating said plunger; with a bifurcated slide-bar engaging said lever, a grooved cam for operating said bar mounted upon a rotatable shaft, and a guide for said slide, said shaft passing through openings in said guide and slide-bar, for the purpose and substantially as described.

30. The combination of a type-line holder, a series of ejectors adapted to detect and eject spaces and quads from the line of type, and means for operating said ejectors, and a striker-plate adapted to positively remove all spaces and quads tilted from the line by the ejector; with means for moving a line-type step by step past said ejectors, so that it shall be repeatedly subjected to the action thereof, substantially as described.

31. The combination of a type-line holder having an opening past which a line of type is passed, a series of ejectors beside said opening adapted to detect and eject spaces and quads from the line of type, and means for operating said ejectors; with a line-pusher, a vibrating lever for operating said pusher and a cam for oscillating said lever, said cam having a series of dwells, whereby the lever is caused to move the line of type intermittently or step by step past said opening, so that it shall be repeatedly subjected to the action of the ejectors, substantially as described.

32. The combination of the galley having a fixed side and a movable side and transverse grooves in its bottom dovetailed in cross-section; with guides adapted to embrace the bottom of the galley having their upper portions made fast to the movable side and their lower portions dovetailed in cross-section and engaging the grooves in the bottom of the galley, and clamping-screws attached to the guides, substantially as described.

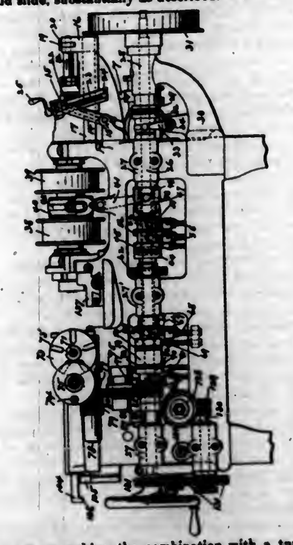
33. The combination of the vertically-movable pusher-bar having slots in its ends, the vertically-movable bars carrying said pusher-bar, and means for raising and lowering said bars; with pivoted levers having blocks pivoted on their ends and sliding in the grooves in the ends of the pusher-bar and means for oscillating said levers for the purpose and substantially as described.

34. The combination of the vertically-movable pusher-bar having slots in its ends, the vertically-movable bars carrying said pusher-bar having their lower ends slotted to embrace a rotary shaft and cams on said shaft for raising and lowering the said bars; with pivoted cam-levers having blocks pivoted on their upper ends and sliding in the grooves in the ends of the pusher-bar, and cams on said shaft for oscillating said levers, all for the purpose and substantially as described.

35. The combination with a type-line channel, mechanism for feeding lines of type thereto and a plunger for forwarding lines of type therein; of a break-lever for operating said plunger, having a lower part pivoted to a fixed support and connected to a cam-actuated lever, and an upper part pivoted on the lower part and held in alinement therewith by springs, the upper part being also connected to the plunger, for the purpose and substantially as described.

36. The combination of a type-line holder, a plunger for forwarding lines of type therein, a break-lever for operating said plunger, said break-lever consisting of a lower part pivoted on the fixed support and an upper part pivoted on the lower part and connected by links to the plunger and held in alinement with the lower part by means of springs; with an adjustable stop for limiting the movement of the plunger thereby arresting the movement of the upper portion of the lever, and means for imparting a uniform swing to the lower portion of the lever, substantially as described.

604,806. METAL-SCREW MACHINE. WILLIAM S. DAVENPORT, Providence, R. I., assignor to The Brown & Sharpe Manufacturing Company, same place. Filed Oct. 4, 1897. Serial No. 653,980. (No model.)



Claim.—1. The combination of a support for a plurality of tools, of mechanism for indexing said support, mechanism for advancing said support, and independent mechanism for returning said support, substantially as described.

2. The combination of a support for a plurality of tools, of mechanism for indexing said support, a cam for advancing said support, and mechanism independent of said cam for returning said support, substantially as described.

3. In a screw-machine, the combination with the turret-slide, of mechanism for advancing said slide, and independent mechanism for returning said slide, substantially as described.

4. In a screw-machine, the combination with the turret-slide, of a cam for advancing said slide, and mechanism independent of said cam for returning said slide, substantially as described.

5. In a screw-machine, the combination with the turret-slide, a turret mounted thereon and mechanism for indexing the same, of mechanism for advancing said slide, and independent mechanism for returning said slide, substantially as described.

6. In a screw-machine, the combination with a turret-slide, a turret mounted thereon and mechanism for indexing said turret, of mechanism for moving said slide during the cutting, and independent mechanism for moving said slide during the non-cutting movement, substantially as described.

7. In a screw-machine, the combination with a turret-slide, a turret mounted thereon and mechanism for indexing said turret, of a continuously-moving cam for advancing said slide, and intermittently-operating mechanism for returning said slide, substantially as described.

8. In a screw machine, the combination with a turret-slide, of mechanism for advancing said slide, and mechanism carried by said slide for returning the same, substantially as described.

9. In a screw-machine, the combination with a turret-slide, of a cam for advancing said slide, and mechanism carried by said slide for returning the same, substantially as described.

10. In a screw-machine, the combination with a turret-slide, a turret-head mounted thereon, and mechanism for indexing the same, of mechanism for advancing said slide, and mechanism carried by said slide and driven from the indexing mechanism for returning said slide, substantially as described.

11. In a screw-machine, the combination with a turret-slide, a turret mounted thereon, and mechanism for indexing said turret, of a reciprocating member, a bar connected with said slide for engaging said member, means for intermittently causing a relative reciprocating movement between said bar and turret-slide, and a stop for said bar, substantially as described.

12. In a screw-machine, the combination with a turret-slide, a turret mounted thereon and mechanism for indexing said turret, of a block, a cam and connections for reciprocating said block, a bar connected with said slide for engaging said block, a stop for said bar, and means for intermittently causing a relative reciprocating movement between said turret-slide and bar, substantially as described.

13. In a screw-machine, the combination with a turret-slide, a turret mounted thereon, and mechanism for indexing said turret, of a block, means for reciprocating said block, a bar for engaging said block, a stop for said bar, a crank on said turret-slide, and means for intermittently rotating said crank substantially as described.

14. In a screw-machine, the combination with a turret-slide, a turret mounted thereon and mechanism for indexing said turret, of a block provided with a rack, a lever provided with a segmental gear engaging said rack, a cam for operating said lever, a bar for engaging said block, a stop for said bar, a crank on said turret-slide connected with said bar, and means for intermittently revolving said crank, substantially as described.

15. In a screw-machine, the combination with a turret-slide, a turret mounted thereon and mechanism for indexing said turret, of mechanism for advancing said turret-slide, and mechanism operated from the indexing mechanism for returning said slide, substantially as described.

16. In a screw-machine, the combination with a turret slide, a turret mounted thereon and mechanism for indexing said turret, of mechanism for moving said slide during the cutting and mechanism operated from said indexing mechanism for moving said turret-slide during the non cutting movement, substantially as described.

17. A slide, a reciprocating member, a bar connected with said slide for engaging said member, means for intermittently causing a relative reciprocating movement between said slide and bar, and a stop-bar for said bar, substantially as described.

18. A slide, a block, means for reciprocating said block, a bar for engaging said block, a stop for said bar, a crank on said slide, connected to said bar, and means for intermittently rotating said crank, substantially as described.

19. A slide, a block, a cam and connection for reciprocating said block, a bar connected with said slide for engaging said block, a stop for said bar, and means for intermittently causing a relative reciprocating movement between said bar and slide, substantially as described.

20. A slide, a block provided with a rack, a lever provided with a segmental gear engaging said rack, a cam for operating said lever, a bar connected with said slide for engaging said block, a stop for said bar, and means for intermittently causing a relative reciprocating movement between said bar and slide, substantially as described.

21. A slide, a block provided with a rack, a lever provided with a segmental gear engaging said rack, a cam for operating said lever, a bar for engaging said block, a stop for said bar, a crank on said slide connected with said bar, and means for intermittently rotating said crank, substantially as described.

22. A slide, a rack, guided on said slide, a bar guided on said slide and provided with a shoulder for engaging said rack, a stop for said bar, an oscillating gear engaging said rack, and means for causing a relative reciprocating movement between said bar and slide, substantially as described.

23. A slide, a block guided on said slide, means for reciprocating said block, a bar guided on said slide and engaging said block, a stop for said bar, and means for intermittently causing a relative reciprocating movement between said slide and bar, substantially as described.

24. A slide, a rack guided on said slide, an oscillating gear for operating said rack, a bar guided on said slide for engaging said rack, a stop for said bar, a crank on said slide connected with said bar, and means for intermittently rotating said crank, substantially as described.

25. In a screw-machine, the combination with a turret-slide, and a turret mounted thereon, of mechanism for indexing said turret carried by said slide, a driver for said mechanism mounted on the frame, and gearing between said driver and indexing mechanism, substantially as described.

26. In a screw-machine, the combination with a turret-slide, and a turret mounted thereon, of mechanism for indexing said turret carried by said slide, a shaft extending longitudinally of said slide and connected with said mechanism, a gear on said shaft, a gear mounted on the frame engaging said gear, and means for intermittently revolving the gear on the frame, substantially as described.

27. In a screw-machine, the combination with a turret-slide, and a turret mounted thereon, of a disk connected with said turret and provided with radial slots, a crank on said slide for engaging said slots, and means for intermittently revolving said crank, substantially as described.

28. In a screw-machine, the combination with a turret-slide, and a turret mounted thereon, of a disk connected with said turret-head, and a crank-pin on said turret-slide arranged to enter and leave said slots when moving radially of said disk, substantially as described.

29. The combination with means for engaging the stock, of a slide connected therewith, a lever, an adjustable pivotal connection between said slide and lever, and means for oscillating said lever, substantially as described.

30. The combination with means for engaging the stock, of a slide connected therewith, a lever, a groove in one of said parts, an adjustable stud secured to the other part and engaging said groove, and means for oscillating said lever, substantially as described.

31. The combination with means for engaging the stock, of a slide connected therewith, a lever, a slot in one of said parts, a stud secured to the other lever and engaging said groove, means for adjusting said stud in line with said groove when the lever is at the forward limit of its throw, and means for oscillating said lever, substantially as described.

32. The combination with means for engaging the stock, of a slide, a screw-rod on said slide, a stud engaged by said screw-rod, a lever provided with a groove engaged by said stud, and a cam for oscillating said lever, substantially as described.

33. In a screw-machine, the combination with a turret-head for holding a series of tools, mechanism for indexing said turret-head, a driver for said mechanism, a device for holding said driver out of operation, means for tripping said device to allow the driver to operate, and means for tripping said device to prevent the driver from being thrown out of operation, substantially as described.

34. In a screw-machine, the combination with a turret-head for holding a series of tools, mechanism for indexing said head, a driver for said mechanism, a cam connected with said driver, an abutment in the path of the cam for holding the driver out of operation, means for tripping said abutment to render the driver operative, and means for tripping said abutment to prevent the engagement of the cam and abutment, substantially as described.

35. In a screw-machine, the combination with a turret-head, for holding a series of tools, a clutch-gearing between said clutch and turret-head, a cam on said clutch, an abutment in the path of said cam, means for tripping said abutment, a disk driven from said clutch, and a series of slides carried by said disk for engaging said abutment, substantially as described.

36. In a screw machine, the combination with a turret-head for holding a series of tools, a clutch, gearing between said clutch and turret-head, a cam on said clutch, an abutment in the path of said cam for holding said clutch out of engagement, means for tripping said abutment, and a series of adjustable devices carried by said gearing for holding said abutment out of the path of said cam, substantially as described.

37. The combination of a clutch, a cam on said clutch, an abutment in the path of said cam, means for tripping said abutment, a disk driven from said clutch, and a series of slides carried by said disk for engaging said abutment, substantially as described.

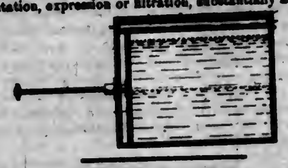
38. The combination of a clutch, a cam on said clutch, an abutment in the path of said cam, means for tripping the abutment, a disk driven from said clutch, and a series of adjustable pins for engaging said abutment, substantially as described.

39. In a screw-machine, the combination with mechanism for operating the jaws of the chuck embodying a cam, a shaft on which said cam is mounted, a driver for said shaft, means for holding said driver out of operative position, means for manually operating the jaws of the chuck, and simultaneously throwing said driver into operative position, substantially as described.

40. In a screw-machine, the combination with mechanism for operating the jaws of the chuck, of a driver therefor, means for rendering said driver inoperative, and means for manually operating the chuck-jaws and simultaneously rendering said driver operative, substantially as described.

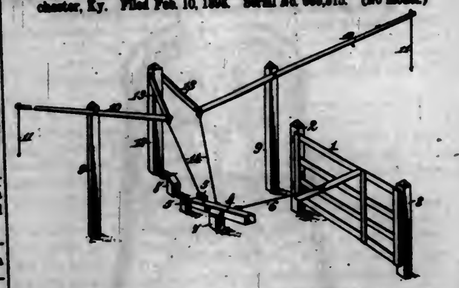
41. In a screw-machine, the combination with the chuck, of mechanism for reversing said chuck, mechanism for operating the chuck-jaws and feeding the stock, a cam-shaft for operating said feeding and jaw-operating mechanism, a tarret, indexing mechanism for said turret, a shaft and intermittently-operating drivers on said shaft for operating the reversing mechanism, cam-shaft and indexing mechanism, substantially as described.

42. In a screw-machine, the combination with mechanism for operating the jaws of the chuck embodying a lever, a cam-shaft, a cam on said shaft for operating said lever, mechanism for feeding the stock embodying a lever, a cam on said shaft for operating said lever, a driver for said shaft, and a cam on said shaft engaged by the end of the jaw-operating lever and so arranged that movement of said lever to open the jaws will turn said shaft, substantially as described.



43. The combination of a shifter, a cam for operating said shifter in each direction, a clutch for operating said cam, two cams on said clutch, an abutment in the path of each cam for holding the clutch out of engagement, and means for rendering said abutments inoperative, substantially as described.

44. In a screw-machine, the combination with the spindle, one or more cross-slides, and mechanism for reversing the direction of rotation of the spindle, of a front shaft, one or more cams on the end of said shaft for operating the cross-slides, a second shaft in line with said front shaft provided with means for controlling the reversing mechanism, and a movable coupling between said shaft, substantially as described.



604,807. PROCESS OF TREATING OILS AND FATS. WILLARD G. DAY and RAYMOND M. GRAGHER, Baltimore, Md., assignors of one-third to Thomas A. Bryan, same place. Filed Feb. 9, 1897. Serial No. 622,665. (No specimens.)

Claim.—1. The process of extracting and purifying oils and fats, which consists in subjecting them to the actinic power of an electric light to break down the nitrogenous sheaths or envelops of the fat-globules, and then separating the broken-down sheaths or envelops by expression or filtration, substantially as specified.

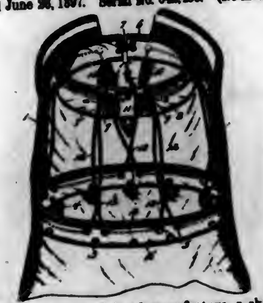
2. The process of imparting flavors and odors to purified oils and fats, which consists in making an aqueous solution of the flavor or odor giving material, then adding to the solution the purified oil or fat to make an emulsion, then subjecting the emulsion to the actinic power of an electric light, and then separating the oil or fat by decantation, expression or filtration, substantially as specified.

604,808. GATE-OPERATING MECHANISM. JOHN W. DEAN, Winchester, Ky. Filed Feb. 10, 1898. Serial No. 669,815. (No model.)

Claim.—1. In combination with the gate-post 2, having a gate mounted thereon, the posts 9 having pivotally supported thereon the lever-arms 10, a post, 12, located between the posts 9, rods pivotally connected to said post and to the inner ends of said lever-arms, a beam pivotally supported at its lower end between the posts 9 and in line with the post 12, rods pivotally connecting the inner ends of said lever arms with said beam and a rod connecting the outer end of said beam with the gate, substantially as described.

2. In combination with the gate-post 2 having a gate mounted thereon, the posts 9 having pivotally supported thereon the lever-arms 10, a post 12 located between the posts 9, rods pivotally connected to said post and to the inner ends of said lever-arms, a beam pivotally supported at its lower end between the posts 9 and in line with the post 12, rods pivotally connecting the inner ends of said lever-arms with said beam, and being connected with said beam toward its lower end, a rod connecting the outer end of said beam with the gate, and being connected with the gate toward its rear end, and the posts 7 and 8, the combination operating in the manner set forth.

604,809. COTTON-PLOW. MIKEY DEAN, El Dorado, Ark. Filed Aug. 31, 1897. Serial No. 650,161. (No model.)



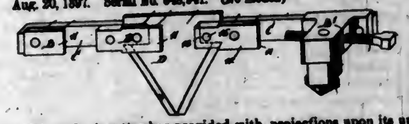
Claim.—1. In combination, a beam, a cross-piece secured to the beam intermediate of its ends and having its outer end portions longitudinally slotted, forwardly-divergent side bars bearing earth-treating devices, means for securing the rear ends of the side bars against opposite sides of the beam, and means for adjustably connecting the front ends of said side bars with the cross-piece and operating in the slots thereof, substantially as set forth.

2. In combination, a beam, upper and lower plates secured to the beam at an intermediate point and having their outer end portions longitudinally slotted and connected, forwardly-convergent braces connecting the outer extremities of the plates with the front portion of the beam, forwardly-divergent side bars bearing earth-treating devices, and means for connecting the rear ends of the side

bars with the beam and their front ends with the slotted ends of the plates, substantially as set forth.

3. The herein-described plow, comprising a beam having its rear end tapering, a cross-bar secured to the beam about midway of its length, upper and lower plates secured to the cross-bar and connected at their outer ends, and provided with longitudinal slots, braces connecting the outer ends of the plates with the front portion of the beam, forwardly-divergent side bars bearing shovels or earth-treating devices, means for connecting the rear ends of the side bars with the tapering end of the beam, and fastenings operating in the longitudinal slots of the upper and lower plates and adjustably connecting the front ends of the side bars therewith, substantially in the manner and for the purpose specified.

604,810. SKIRT-LIFTER. BARBARA M. PERSON, Philadelphia, Pa. Filed June 26, 1897. Serial No. 642,486. (No model.)



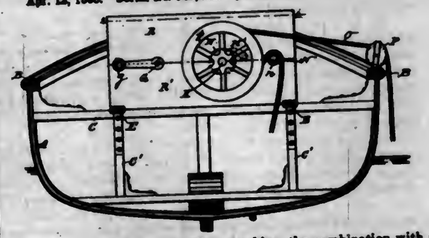
Claim.—1. As a new article of manufacture, a skirt-lifter comprising a lower lifting-band adapted to be connected to the skirt and provided with eyelets arranged in pairs at different points around its length, an upper waistband made separate from the skirt and provided also with spaced eyelets, and lifting-cords connecting said bands and extending in pairs out through an eyelet of the waistband and down, each through an eyelet of a pair in the lifting-band, thence in opposite directions along said band, each out through an eyelet of another pair, and thence up to and through the waistband, the free ends of the cords being connected to form lifting-cords, substantially as described.

2. In a dress-skirt elevator, the combination with a skirt, of a lower lifting-band secured thereto which encircles the skirt and has eyelets at different points of its own length, an upper waistband having a series of eyelets extending around the band, and sets of lifting-cords for the sides of the skirt, the cords of each set having free ends secured together and formed into a pull-cord, and passing through one eyelet of the waistband, thence through an eyelet of the lifting-band, along the length of said lifting-band and out through the next eyelet thereof, and then through another eyelet of the waistband.

3. In a dress-skirt elevator, the combination with a skirt, of a lower lifting-band secured to the skirt and extending therearound, said band having eyelets arranged in sets, an upper waistband having separated eyelets and lifting-cords extending from the waistband to the lifting-band and arranged in the following manner, to wit: having their ends connected together, forming two separate pull-cords, then arranged in sets which pass through the eyelets of the waistband, thence down to the lifting-band where the cords of the set separate, being passed through the sets of eyelets of the lifting-band, along said band and out through the eyelets of the next set, thereby forming lifting-loops, and the set of cords at the back of the skirt having their upper ends diverged and passed through the rear eyelets of the band in opposite directions, around said band and connected to the respective pull-cords.

604,811. CUTTER-BAR. CHARLES H. FRYE, Wilton, N. H. Filed Aug. 20, 1897. Serial No. 648,941. (No model.)

Claim.—1. A cutter-bar provided with projections upon its upper face at predetermined intervals apart, the inner end of each of the projections being provided with a lip and an undercut longitudinal recess in its front and rear faces, the outer end of each of the said projections being of reduced width, knives or blades having T-shanks, the shank portions being arranged to enter spaces between opposing blocks, and the heads of the shanks and the rear ends of the blades to enter the undercut recesses in the said blocks, and a cap fitted for locking engagement with the blocks on the cutter-bar, for the purpose set forth.



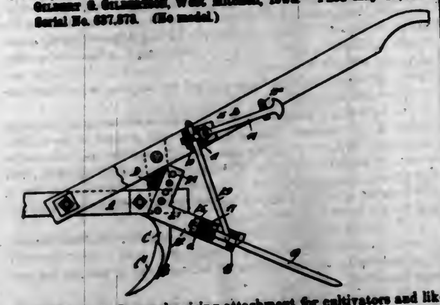
2. A cutter-bar provided with a series of projections or blocks upon its upper face, the said projections being spaced apart a predetermined distance, one end of each of the projections or blocks being provided in its sides with undercut recesses, a knife or blade secured in each of the spaces between the blocks, a portion of the knife being arranged to engage the said side recesses, and a cap arranged for locking engagement with all of the projections or blocks, substantially as described.

3. The combination with a cutter-bar provided with a series of blocks or projections upon its upper face, one end of each block being provided with a lip and having undercut recesses in its front and rear faces, and knives or blades secured in the spaces between the blocks and having portions arranged to engage the recesses in the said blocks, of a cap provided with chambers adapted to receive the blocks of the cutter-bar, each chamber having an end recess to receive the lips of said blocks, the cap being adapted for end movement, and a locking device for the said cap, substantially as described.

4. The combination, with a cutter-bar provided with a series of blocks or projections upon its upper face, one end of each block being wider than its opposite end, the wider end of each block being provided with a lip and its sides with undercut recesses, of blades or knives provided with T-shanks, the shanks being adapted to enter the spaces between opposing blocks and likewise to enter the side recesses of the blocks and that portion beneath the lips of the blocks, a cap provided with chambers adapted to receive the blocks of the cutter-bar, each chamber being provided with an end recess to receive the lips of said blocks, and a locking device whereby the cap may be held locked upon the said bar, for the purpose specified.

5. The combination with a cutter-bar provided with a head at its inner end, of a pin secured in the said head and having an enlarged outer end, and a polygonal block loosely mounted on the pin between the enlarged end of the pin and the head of the cutter-bar, the polygonal block being adapted to receive a driving-pitman, substantially as described.

604,812. SEINE-PURSING MACHINE. CHARLES H. GAFFNEY, Gloucester, Mass., assignor to William B. Lewis, same place. Filed Apr. 12, 1895. Serial No. 545,461. (No model.)



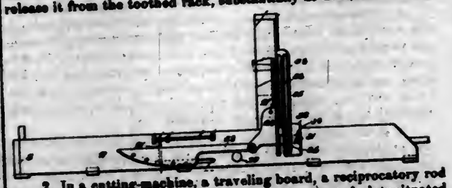
Claim.—1. In a seine-hauling machine, the combination with a floating or other support, of a casing hinged to said support and provided with three sets of shaft-bearings in its sides, a longitudinally-adjustable crank-shaft journaled in two of said bearings and carrying a pinion and a gear-wheel of different diameters, a drum-shaft journaled in two of said bearings in front of the crank-shaft and provided with a pinion and a gear-wheel which are adapted to mesh with the pinion and gear-wheel on the crank-shaft, the aforesaid gears and pinions being inclosed by the casing, a pawl and ratchet each end of the drum-shaft outside the casing, a pawl and ratchet adapted to hold the latter-named shaft against backward rotation, a third shaft journaled in bearings in the casing in front of the drum-shaft and having its ends extending upward in front of said drums, and a sleeve or trunnion mounted upon each end extension of said third shaft, substantially as described.

2. In a seine-hauling machine, the combination with a suitable support, of a casing hinged to the said support and provided with three sets of shaft-bearings in its side walls, said bearings being in a line with each other, a longitudinally-adjustable crank-shaft journaled in two of said bearings and carrying a pinion and a gear-wheel, a drum-shaft journaled in two of said bearings in front of the crank-shaft, a pinion and a gear-wheel fixed to said drum-shaft and adapted to mesh with the gear-wheel and pinion on the crank-shaft, a rope-drum mounted on each end of the drum-shaft outside the casing, means for preventing the backward rotation of the drum-shaft, a third shaft journaled in the remaining bearings in the casing in front of the drum-shaft and having its ends extending outward a short distance so as to be in a line with the periphery of the drums, and an elastic or yielding trunnion mounted upon the end extensions of said shaft, substantially as described.

3. In a seine-hauling machine, the combination with a support, of a casing hinged to said support, a longitudinally-adjustable crank-shaft journaled in said casing, gear-wheels of different diameters secured to the said crank-shaft, a drum-shaft also journaled in said casing, gear-wheels of different diameters secured to the said drum-shaft and adapted to mesh alternately with the gear-wheels on the crank-shaft, a rope-drum mounted on each end of the drum-shaft outside the casing, a pawl and ratchet adapted to hold the said drum-shaft against backward rotation, a third shaft journaled in the said casing and having its ends extending outwardly in front of said rope-drums, and a sleeve or trunnion mounted upon each end extension of the said shaft, substantially as described.

604,813. PULVERIZING ATTACHMENT FOR CULTIVATORS. GILBERT G. GILBERTSON, West Mitchell, Iowa. Filed May 24, 1897. Serial No. 637,573. (No model.)

Claim.—1. In a pulverizing attachment for cultivators and like implements, the combination with a head, tines carried thereby, and means for adjustably connecting the head with the beam of the implement of a clamp comprising cross-bars connected at one end to the cultivator-handles, a hanger connected to the tine portion of the attachment and entering said portion, and a clamping-screw passing through the bars of the clamp and securing the hanger, substantially as described.



2. A combination with the beam and the handles of a cultivator or like implement, of a pulverizing attachment consisting of tines, a support for the tines which support is pivotally connected with the beam, cross-bars connecting the handles, a clamping device laterally adjustable on said cross-bars and a hanger connected with the tine portion of the device and secured by said clamp, whereby the head may be adjusted in position, substantially as described.

3. A pulverizing attachment for cultivators, comprising a head formed as a bar extending across the same and having thereon a series of rearwardly-extending rake-like tines, a bar attached to the head and to the cultivator-frame forwardly, two bars extended between the cultivator-handles and each having one end bent to one side and secured to the handle and the other end having a slight side bend toward the other bar and also having a slot in one end of the central straight body, and a pin in the other end, said pins being adapted to enter the slot in the opposite bars, one of said bars having a longitudinally-extending central slot and the other a series of threaded holes opposite said slot, a bolt passing through the central slot and threaded into one of the central holes, and a stay formed as a rod bent upon itself, with the ends hooked and engaging the rake-head and near the central bend parallel and embracing the bolt between the two cross-bars, substantially as described.

4. The combination, with the beam and handles of a cultivator or like implement, a clamp secured to the handles, and an adjusting-screw for said clamp, of a pulverizing attachment consisting of a head, tines carried by the head, adjusting-plates adjustably connected with said head and pivotally and adjustably connected with said beam, and a hanger pivotally connected with the head and received by said clamp.

604,814. CANDY-MACHINE. EDWIN F. GOULD, Machias, Me., assignor of one-half to Clement B. Dunworth, same place. Filed Aug. 12, 1897. Serial No. 648,098. (No model.)

Claim.—1. In a cutting-machine, a traveling board provided on its lower face with a toothed rack, in combination with a reciprocatory rod arranged underneath said board and provided on one end with a pivoted spring-actuated pawl for engaging said rack, a pivoted operating-lever and intermediate devices for actuating said rod, and a laterally-sliding detent adapted to engage the said pawl and release it from the toothed rack, substantially as described.

2. In a cutting-machine, a traveling board, a reciprocatory rod for moving the same, an operating-lever, and a pivoted plate situated in the path of said operating-lever and connected with said reciprocatory rod.

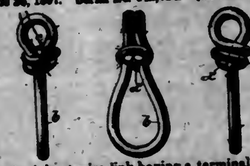
3. In a cutting-machine, a traveling board, a reciprocatory rod provided with devices for engaging the same, a lateral extension upon said rod, a link adjustably connected with said lateral extension, an operating-lever and a pivoted plate located in the path of said lever and connected with said link to move the same backwardly and forwardly.

4. In a cutting-machine, a traveling board, a reciprocatory rod for moving the same, a knife-operating lever, a slide provided with a guide to receive said knife-operating lever, a plate pivoted to said slide and situated in the path of said knife-operating lever, and connections between said plate and the reciprocatory rod to move the latter through the movement of the former.

5. In a cutting-machine, a traveling board, a reciprocatory rod for moving said board, a knife-operating lever, an upright slide having a guide to receive said knife-operating lever, a plate pivoted upon the frame of the machine having an adjustable pivotal connection with said slide, and connected with said reciprocatory rod for moving the same.

6. In a cutting-machine, a frame provided with uprights, a knife sliding in said uprights, an operating-lever having one end situated in the slot of one of said uprights, an antifriction-roller situated above said operating-lever, a lever pivoted to said knife and to said operating-lever and having its ends situated within a slot in the other upright, and an antifriction-roller situated within said slot and above said lever.

7. In a cutting-machine, a movable knife, a knife-operating lever, a lever pivoted to the frame of the machine, a slide having a guide to receive said operating-lever, a slot in said slide, a plate adjustably secured to said slide by means of an adjusting-screw extending through said slot, a pivotal connection between said lever and said plate, and connections between said lever and the traveling board for moving the latter.



604,815. COIN-HOLDER. JOSEPH GREEN, Philadelphia, Pa. Filed Feb. 15, 1897. Serial No. 623,413. (No model.)

Claim.—1. The combination with a coin-holder and coin retaining and releasing means projecting from one side or edge thereof, of attaching means for securing said holder to the clothing, and a face-plate extending over the front of the holder and concealing said releasing means, substantially as described.

2. A coin-holder, comprising a series of flat cases arranged side by side and secured flatwise against each other, in combination with independent means for each case for holding and releasing the coins, the releasing means of one case being on the opposite side of the article from the releasing means of the adjacent case, substantially as described.

604,816. CHAIN-LINK. WILLIAM H. GRIFFITH, New York, N. Y. Filed June 26, 1897. Serial No. 642,734. (No model.)

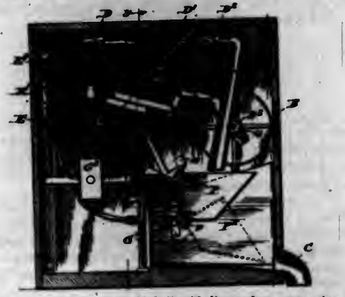
Claim.—1. A bent-wire link having a terminal eye at one end, a loop, a bight or coil corresponding in size to and coinciding with the terminal eye and forming a duplex eye with parallel folds, a transverse wrap below the coinciding eye and bight, said link having also

the end of its eye extended below the transverse wrap and held within its embrace substantially as and for the purpose described.

2. A bent-wire link having a relatively small terminal eye at one end, a relatively large loop, a bight or coil corresponding in size to and coinciding with the terminal eye, and forming a duplex eye with parallel folds and a transverse wrap below the coinciding eye and bight, and said link having the end of one of its eyes extended between and lying within the fork formed by the legs of the loop substantially as and for the purpose described.

3. A bent-wire link having a relatively small terminal eye at one end, a relatively large loop, a bight or coil corresponding in size and coinciding with the terminal eye, and forming a duplex eye with parallel folds, and a transverse wrap below the coinciding eye and bight, one end of said wrap being extended between the legs of the loop and lying within the acute angle fork of the same substantially as and for the purpose described.

604,817. COMPOSITE FUEL AND PROCESS OF MAKING SAME. GEORGE GRIFFITHS, Los Angeles, Cal., assignor of one-half to William Henry Avery, same place. Filed Feb. 15, 1897. Serial No. 623,569. (No specimens.)



Claim.—1. A composition of matter to compose a fuel consisting of thoroughly-dried eucalyptus leaves and twigs cut into short lengths, bray or asphaltum, crude petroleum, and distillate.

2. The process of producing composite fuel, which consists in boiling bray and crude petroleum together until smooth and sticky; adding eucalyptus leaves and twigs chopped to suitable size; thoroughly incorporating the same with the mixture, and while hot, molding into suitable blocks.

3. The process of making composite fuel, which consists in placing bray and a little crude petroleum in a receptacle, bringing it to the boiling-point, boiling until smooth, then adding more crude petroleum and boiling thoroughly; then adding thoroughly-dried eucalyptus leaves and twigs cut into suitable lengths; thoroughly incorporating the leaves and twigs with the mixture; then adding distillate, and while the mixture is still hot, molding into suitable blocks.

4. The process of producing composite fuel, which consists in placing bray, with a little crude petroleum, in a receptacle; bringing the mixture to the boiling-point and boiling until smooth; then adding more crude petroleum and boiling until smooth and sticky; then adding thoroughly-dried eucalyptus leaves and twigs chopped to suitable size; thoroughly incorporating the same with the mixture, and while still hot, molding into suitable blocks.

604,818. COIN-CONTROLLED APPARATUS FOR DISPENSING LIQUIDS. WILLIAM P. HACKETT, Winchester, Ky. Filed July 21, 1897. Serial No. 645,312. (No model.)

Claim.—1. A coin-controlled liquid-dispensing apparatus, comprising a faucet, a cylinder with piston and rod connected to and operating the faucet, a compressed-air valve connected to the cylinder, a coin-carrier operating the air-valve, a liquid receiving and weighing device, and a discharge air-valve controlling the escape of air from the cylinder, said discharge-valve being opened by the movement of the liquid-receiving devices substantially as and for the purpose described.

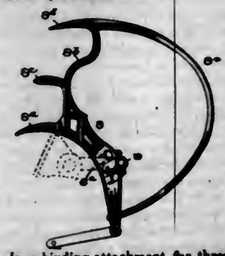
2. In a coin-controlled liquid-dispensing apparatus, the combination with a compressed-air cylinder and piston for working the faucet; of an air-discharging device for said cylinder comprising a weighing device for receiving the liquid to be dispensed, and a discharge air-valve connected with said cylinder and operated by the weighing device substantially as and for the purpose described.

3. In a coin-controlled liquid-dispensing apparatus, the combination with the air-cylinder for working the faucet; of a discharge-valve for the air, a weighing-scale beam with tilting liquid-receptacle having counterbalance and latch, said scale-beam being arranged to hold said discharge-valve closed until overbalanced by the weight of the liquid weighed substantially as shown and described.

4. In a coin-controlled liquid-dispensing device a faucet, air-cylinder, and weighing-receptacle, all connected together by the crank-arm of the faucet, and operated by the piston of the air-cylinder substantially as shown and described.

5. In a coin-controlled liquid-dispensing apparatus, the combination with the air-cylinder for working the faucet and the faucet-lever; of the hollow standard G' with air-nozzle g' and offsetting fulcrum-frame g^3, scale-beam G G^2 with adjustable weight G^3, valve-section g and ball g', latch g^3, with weight 10 and the tilting liquid-receptacle P, pivoted on the ball p', and provided with counterbalance substantially as shown and described.

6. In a coin-controlled liquid-dispensing apparatus, the combination with the faucet and the air-cylinder and piston for working the same; of an inlet air-valve for the cylinder and a coin-carrier adapted by the weight of the coin, to move and operate the inlet air-valve, substantially as shown and described.

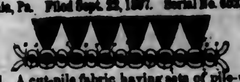


7. In a coin-controlled liquid-dispensing apparatus, the combination with the faucet and the air-cylinder and piston for working the same; of the coin-throat, coin-holder, the clock-gear-tripping mechanism, the lever L and an inlet air-valve for the cylinder consisting of a case with air-duct and a weighted valve-stem, diaphragm, and valve, connected together and operated by the lever L, substantially as shown and described.

8. In a coin-controlled apparatus, the combination of the coin-holder M', the coin-slot plate c and a lever N pivoted in the middle and having its upper end extended partly across the coin-slot and its lower end armed with a pin obstructing the path of the coin, said lever being arranged to open the path of the coin when the slot is fully opened by the insertion of the succeeding coin, substantially as and for the purpose described.

9. The combination with the air-inlet valve and the coin-throat; of a coin-carrier, a clock-spring tripping-gear, and a lever operated upon thereby to open the air-valve substantially as and for the purpose described.

10. The combination with the air-inlet valve, the coin-throat, the air-cylinder, its piston, and the faucet; of a motor-tripping device for the air-valve interposed between the air-valve and the coin-throat and connected to the working parts of the air-cylinder to be regenerated or wound up by the movement of the piston of said air-cylinder substantially as described.



604,819. BINDING ATTACHMENT FOR THRESHERS OR RUBBERS. GEORGE D. HARDER, Cobleskill, N. Y. Filed May 10, 1897. Serial No. 635,915. (No model.)

Claim.—1. In a binding attachment for threshers or rubbers a packer comprising the body portion, the extension carried thereby having a plurality of teeth, and a curved guard extending from the extremity of said extension to the main portion of the packer, substantially as described.

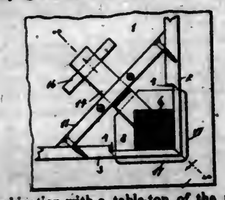
2. In a binder attachment for threshers or rubbers, a packer comprising the body portion, the extension carried thereby having a plurality of teeth, and the curved guard extending from the extremity of said extension to the body portion of the packer, said guard being formed integral with and being a curved extension of the outermost tooth, substantially as described.

604,820. CUT-PILE CARPET FABRIC. HARRY HARDWICK, Philadelphia, Pa. Filed Sept. 22, 1897. Serial No. 652,552. (No model.)

Claim.—1. A cut-pile fabric having sets of pile-warp alternating with sets of divider warp, the whole being interwoven with binding-wefts, the pile being formed by upwardly-extending tufts of warp-thread and the sets of divider-warp each containing two or more pairs of fine binder-warp, so separated as to laterally compress the bases of the tufts of pile-warp, substantially as specified.

2. A cut-pile fabric having sets of pile-warp alternating with sets of divider-warp, the whole being interwoven with binding-wefts the pile being formed by upwardly-extending tufts of warp-thread and each set of divider-warp comprising one or more pairs of fine binder-warp and one or more strands of stuffer-warp, substantially as specified.

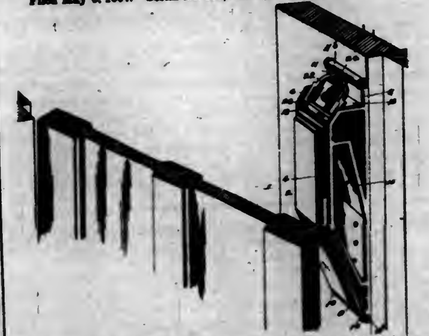
604,821. APPARATUS FOR DISPENSING OIL, &c. ADOLPH HAYE, San Antonio, Tex. Filed Mar. 20, 1897. Serial No. 629,310. (No model.)



Claim.—1. In an apparatus for dispensing oil, the combination with a table, of a tank or reservoir supported on the table-top, said table-top and the bottom of the tank having registering openings, a measuring vessel having a flange at its lower end secured to one of the rails of the table to support the said vessel below the table-top, a faucet firmly secured at its lower end in the upper end of the measuring vessel, and its upper end being threaded and extending through said registering openings, a nut on the threaded upper end of the faucet to engage the inner face of the tank-bottom and clamp the tank to the table-top, and a discharge-faucet in the bottom of the measuring vessel, substantially as described.

2. In an apparatus for dispensing oil, the combination with a table, of a tank or reservoir supported on the table-top, said table-top and the bottom of the tank having registering openings, and the opening in the table-top being of greater diameter than that in the bottom of the tank, a measuring vessel having a flange at its lower end secured to one of the rails of the table to support the said vessel below the table-top, a faucet firmly secured at its lower end in the upper end of the measuring vessel, and its upper end being threaded and extending through said registering openings, a collar on the faucet near its upper end to fit snugly in the opening in the table-top, a washer seated between the said collar and the bottom of the tank, a nut on the threaded upper end to engage the inner face of the tank-bottom, and a discharge-faucet in the bottom of the measuring vessel, substantially as described.

3. In an apparatus for dispensing oil, &c., the combination with a table, of a tank or reservoir supported on the table-top, said table-top and the bottom of the tank having registering openings, a measuring vessel having a flange at its lower end secured to one of the rails of the table to support the said vessel below the table-top, a faucet firmly secured at its lower end in the upper end of the measuring vessel, and its upper end being threaded and extending through said registering openings, a collar on the faucet near its upper end, a washer seated between the said collar and the bottom of the tank, a nut on the threaded upper end to engage the inner face of the tank-bottom, and a discharge-faucet in the bottom of the measuring vessel, substantially as described.



604,822. TABLE. ALFRED H. HEINE and GODFAY A. HOSWELDER, Evansville, Ind. Filed Nov. 26, 1897. Serial No. 660,584. (No model.)

Claim.—1. The combination with a table-top, of the rails cut away at the top at their meeting ends, a leg having a projecting plate on its upper end to engage in the cut-away portion of the rails, a diagonally-extending bridge secured to the under side of the table-top, and having a notch in its upper edge, a wedge designed to pass through said notch and engage with the leg, and a block for holding the wedge tightly against the leg and its plate, substantially as specified.

2. The combination with a table-top, of the rails cut away at their top edge, a leg, a projecting plate on the upper end of the leg for engaging in the cut-away portion of the rails, a notched bridge-piece secured to the table, a wedge for passing through the notch, the said wedge having a notched end to engage the leg and a shoulder to engage the bridge, and a block between the wedge and table-top, substantially as specified.

604,828. LETTER-BOX. JOSEPH J. HERZOG, Baltimore, Md. Filed May 6, 1897. Serial No. 635,948. (No model.)

Claim.—1. In a letter-box, the combination of a hinged cover-plate therefor, a spring-plate engaging the said cover-plate and forming the rear part of the lining of the box, and signal mechanism adapted to be actuated by the movement of the said cover-plate and spring-plate, substantially as and for the purpose specified.

2. In a letter-box, the combination of a casing, a cover-plate movably mounted in connection with the upper part thereof, and a spring plate forming a part of the rear lining of the box and against which a part of the said cover-plate has direct bearing, substantially as and for the purpose specified.

3. In a letter-box, the combination of a casing having an upper shelf and a spring-actuated cover-plate hinged at its lower portion and adapted to project upwardly from the shelf and form means for confining mail-matter thereon, said cover-plate operating a signal when moved downwardly, substantially as and for the purpose specified.

4. In a mail-box, the combination of a casing having its front, sides and back rigidly united against separation and having slots formed in the back thereof screw-hooks attached to a support and extending through said slots, and transverse locking-pins removably mounted under the said screw-hooks and located within a part of the box to hold the said box against movement, substantially as and for the purpose specified.

5. In a letter-box, the combination of a casing having a mail-receptacle with front metal plates, a rear spring-plate, a side with an opening therein conforming to the contour of the receptacle and inclosing the working parts, and a cover-plate with a projection bearing against the upper part of said rear spring-plate, substantially as and for the purposes specified.

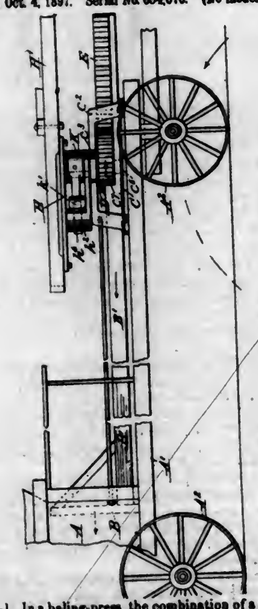
6. In a letter-box, the combination of a casing having a letter-receptacle therein with an entrance-opening at the top thereof, a block projecting over the upper part of said receptacle to form an overhanging shoulder and having an inner inclined face, a metallic plate mounted on said inclined face of the block provided with a

depending lip, and a hinged cover-plate with a lip adapted to extend into the throat of the letter-receptacle, substantially as and for the purposes specified.

7. In a letter-box, the combination of a casing, a movable cover-plate having an inwardly-extending flange, a spring-plate directly engaged and operated by the flange of said cover-plate, a push-pin adapted to be actuated by said spring-plate and an electrically-connected push-button operated by said push-pin, substantially as and for the purposes specified.

8. In a letter-box, the combination of a casing, a movable cover-plate having an inward extension, a spring-plate engaged by the said extension and forming the back lining of the box, a gong-hammer operated by the said plate and extension, and a gong or signal adapted to be struck by the said hammer, substantially as and for the purposes specified.

9. In a letter-box, the combination of a casing having a mail-receptacle therein, an upper plate with a depending lip, an upwardly-extending spring-plate with an outturned upper end, and a cover-plate with an inner extension, substantially as and for the purposes specified.



10. In a letter-box, the combination of a casing having a vertically-disposed mail-receptacle therein, an upwardly-extending spring-plate arranged at an angle of inclination, a front inclined plate forming with the upper part of the said spring-plate an entrance or throat to the mail-receptacle, and a cover-plate having a flange directly and movably engaging the said spring-plate, substantially as described.

11. In a letter-box, the combination of a movable cover-plate having an inwardly-projecting flange, a spring-plate with an upper inturned end and a central slot against which the said flange directly bears, a hinged plate carrying a hammer, a spring engaging the said hammer, and a gong with which the said hammer engages, substantially as and for the purposes specified.

12. In a letter-box, the combination of a casing having an open side, and an upper entrance-throat for the entrance of mail-matter and a spring-actuated door engaging said side and provided with a gravitating catch, substantially as and for the purposes specified.

13. In a letter-box, the combination of a casing having an open side, provided with an upper entrance-throat for mail-matter, a hinged cover-plate for said throat, a hinged door engaging the said side and provided with an upper recess, and a gravitating catch carried by the said door adjacent to the said recess, substantially as described.

604,324. BALING-PRESS. JULIUS H. HOLMGREEN, San Antonio, Tex. Filed Oct. 4, 1897. Serial No. 654,076. (No model.)

Claim.—1. In a baling-press, the combination of a platen, a plunger connected with said platen, a rack mounted on said plunger, a rotatable shaft, a gear fixed on said shaft and engaging with said rack, a yoke journaled at its open end on said shaft, means for rotating said yoke on said shaft, a driver fixed on said shaft between the forks of said yoke and adapted to move clear of the yoke, a dog pivoted in the bifurcation of said yoke for engaging with said driver, and a trip for disengaging said dog from said driver.

2. In a baling-press, the combination of a platen, a plunger connected with said platen, a rack mounted on said plunger, a rotatable shaft, a gear fixed on said shaft and engaging with said rack, a yoke having its forks connected by a casing journaled at its open end on said shaft, means for rotating said yoke on said shaft, a driver fixed on said shaft between the forks of said yoke and adapted to move clear of said casing, a dog pivoted in said casing and adapted to engage with said driver, and a trip for disengaging said dog from said driver.

3. In a baling-press, the combination of a platen, a plunger rigidly connected with said platen and moving in a line parallel with the axis of the baling-chamber, a rack mounted on said plunger and having its teeth following a line in the form of a compound curve, a rotatable shaft, a spiral gear secured on said shaft and in continuous engagement with said rack, a yoke journaled at its open end on said shaft, means for rotating said yoke on said shaft, a driver fixed on said shaft between the forks of said yoke and adapted to move clear of the yoke, a dog pivoted in the bifurcation of said yoke for engaging with said driver, and a trip for disengaging said dog from said driver.

4. In a baling-press, the combination of a platen, a plunger rigidly connected with said platen and moving in a line parallel with the axis of the baling-chamber, a rack mounted on said plunger and having its teeth following a line in the form of a compound curve, a rotatable shaft, a spiral gear secured on said shaft and in continuous engagement with said rack, a yoke having its forks connected by a casing and journaled at its open end on said shaft, means for rotating said yoke on said shaft, a driver fixed on said shaft between the forks of said yoke and adapted to move clear of said casing, a dog pivoted in the said casing and adapted to engage with said driver, and a trip for disengaging said dog from said driver.

5. In a baling-press, the combination of a platen, a plunger connected with said platen, a rack mounted on said plunger, a plate provided with a bearing, a shaft journaled at an end in said bearing, a gear fixed on said shaft and engaging with said rack, a roller-bearing on said plunger for holding said rack and said gear in engagement, a yoke having its forks connected by a casing and journaled at its open end on said shaft, means for rotating said yoke on said shaft, a driver fixed on said shaft between the forks of said yoke and adapted to move clear of said casing, a roller journaled in the outer end of said driver, a dog pivoted in said casing and adapted to engage with the roller carried by the driver, and a trip for disengaging said dog from said roller.

604,325. SELF-ADJUSTABLE AND REVERSIBLE TILE. FRANK T. HOPKINS and HARRY A. HOPKINS, Washington, D. C. Filed Aug. 31, 1897. Serial No. 650,094. (No model.)

Claim.—1. A tile floor or like structure comprising the combination of a plurality of self-adjusting and reversible tiles, the edges of which project at their horizontal centers beyond the upper and lower portions thereof, whereby when the tiles are abutted together uniform filling-spaces will be left on both sides thereof, substantially as described.

2. As an improved article, a reversible tile having its sides beveled from the center to the edges, substantially as described.

3. A tile floor or other construction consisting of a number of tiles abutting against or contacting with each other on a central line with uniform spaces at the upper and lower edges and the cement foundation upon which the said tiles rest, the cement filling the said lower and upper spaces, thus forming a cement locking, substantially as described.

604,326. VALVE. HANNS HÖRBIGER, Buda-Pesth, Austria-Hungary, assignor of one-half to Ladislaus Lang, same place. Filed Aug. 10, 1897. Serial No. 647,734. (No model.) Patented in Belgium Aug. 16, 1895, No. 116,869; in Hungary Oct. 25, 1895, No. 3,933; in France Dec. 3, 1895, No. 248,475; in England Oct. 13, 1896, No. 23,759; in Switzerland Nov. 2, 1896, No. 13,251, and in Austria Jan. 28, 1897, No. 47/250.

Claim.—1. In combination with a valve consisting of a thin circular metal plate having a concentric central hole, a valve-seat, a link-carrier opposite the valve-seat and two or more elastic links, each of which is secured at one end to the valve and at the other end to the link-carrier, such links being arranged symmetrically around the center of the valve and at a comparatively small angle to the plane of the valve-body and tangentially to a circle concentric to the axis of the valve.

2. In combination with a valve, consisting of a thin circular metal plate, having a concentric central hole, a valve-seat, one or more thin buffer-plates similar and parallel to the valve and secured on the back thereof with the interposition of washers, a link-carrier opposite the valve-seat and two or more elastic links arranged symmetrically around the center of the valve, each of such links being secured at one end to the valve and at the other to the link-carrier, making a comparatively small angle with the plane of the valve-body and being tangential to a circle concentric with the axis of the valve.

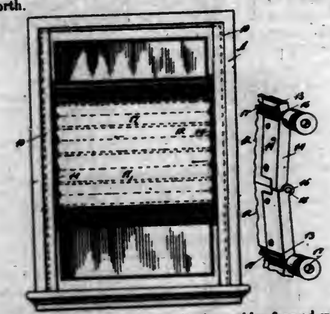
3. In combination with a valve consisting of a thin circular metal plate, having a concentric central hole, a valve-seat, one or more supporting-rings between and concentric to the two valve-seat edges, a link-carrier opposite the valve-seat and two or more elastic links, arranged symmetrically around the center of the valve, each of such links being secured at one end to the valve, making a comparatively small angle with the plane of the valve-body and at the other to the link-carrier and being tangential to a circle concentric with the axis of the valve.

4. In combination with a valve, consisting of a thin circular metal plate, having a concentric central hole, a valve-seat, a link-carrier opposite the valve-seat, two or more elastic links arranged symmetrically around the center of the valve, each of such links being secured at one end to the valve and at the other to the link-carrier making a comparatively small angle with a plane of the valve-body and being tangential to a circle concentric with the axis of the valve, one or more valves similar and concentric to the first-mentioned valve and connected therewith by radial arms and seats for the last-mentioned valve or valves.

604,327. DEVICE FOR REMOVING BROKEN DRILL-RODS. JOHN HUNER, Helena, Wash. Filed May 25, 1897. Serial No. 638,084. (No model.)

Claim.—A device for removing broken bits from drill-holes formed by said bits, the same consisting of a permanent magnet cylindrical in form, bifurcated at one end to resemble the arms of an ordinary horseshoe-magnet, said arms being adapted at their ends to receive and retain a keeper, the opposite end of said magnet being made in the form of a hollow sleeve adapting it to receive and retain a non-conducting rod or stem, substantially as and for the purpose described.

604,328. NON-REFILLABLE BOTTLE AND SEAL. ALFRED J. JONS, Philipsburg, Mont. Filed Nov. 6, 1897. Serial No. 657,633. (No model.)



Claim.—As a new article of manufacture, a seal or stopper for bottles, consisting of a metallic disk and a washer of larger diameter than said disk, provided with radially-extending slits forming wings which are bent inwardly, reducing the diameter of said washer, and are adapted to be forced outwardly so as to engage a shoulder on the inner surface of the bottle in which the same is inserted, the said disk being formed with an integral leg at its center which extends through an opening at the center of said washer, and is afterward upset, forming a pivotal connection between said disk and washer, as and for the purpose set forth.

604,329. WINDOW-SHADE. JOHN S. JONES, Peterborough, Canada. Filed Aug. 19, 1897. Serial No. 648,742. (No model.)

Claim.—1. A window-shade, consisting of a series of slats pivotally connected together, and arranged in pairs, each pair of slats at opposite ends being provided with roller-bearings spring-pressed in an outward direction, as set forth.

2. A window-shade consisting of a series of pivotally-connected slats, and roller-bearings projected from the end portions of sundry of the said slats, the said roller bearings being in spring-controlled sections.

3. The combination, with the window-frame provided with a tubular guide formed with a longitudinal slot, of the window-shade composed of a series of slats pivotally connected together, and tension devices in said guide and connected through said slot with sundry of said slats, whereby the slats may be held at any desired height, as set forth.

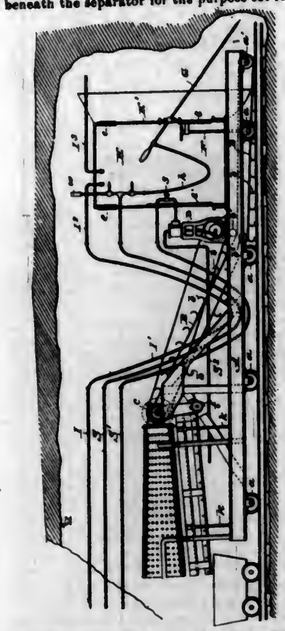
4. The combination with the tubular guides formed with longitudinal slots, of the series of slats pivotally connected together and having spindles extended through said slots into said guides, and tension devices in said guides and connected with said spindles, said tension devices being formed in sections spring-pressed against opposite walls of said guides, as and for the purpose set forth.

5. A window-shade consisting of a series of pivotally-connected slats, the said slats being arranged in pairs and each pair of slats at opposite ends being provided with a spindle, and roller-bearings at the ends of the spindles, the roller-bearings being constructed in telescopic sections, and springs interposed between the said sections, for the purpose set forth.

6. The combination with the window-frames having guides, of a shade composed of slats pivotally connected together and arranged in pairs, each pair at opposite ends being provided with a spindle having its ends extending into the guides, hollow cylinders 18 in said guides and received on the ends of said spindles, cylinders 22 in which the spindle ends are loosely inserted and telescoping with the cylinders 18, and springs coiled around the ends of said spindles and bearing against each cylinder 18 and its corresponding cylinder 22 to press the same apart, as and for the purpose set forth.

7. The combination, with guides having vertical slots therein, of a shade consisting of a series of pivotally-connected slats, sundry of the said slats being provided with friction-rollers at their end portions, said friction-rollers being constructed in telescopic, spring-controlled sections, arranged to enter and travel in said guides, for the purpose specified.

604,330. MINING APPARATUS. GEORGE F. KEBLING, Hanover, N. H. Filed Oct. 16, 1897. Serial No. 655,575. (No model.)

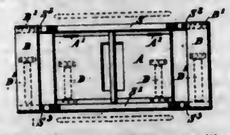


Claim.—1. In an apparatus for excavating tunnels in naturally-frozen soil, the combination with a bed or platform, an endless conveyer mounted on said platform, a wall or support attached to the platform to the rear of the front end of the endless conveyer, an excavating-tool carried by the wall or support so as to project through the same and a steam supply pipe connected to the tool, substantially as shown and for the purpose set forth.

2. In a mining apparatus for excavating in frozen soil, the combination of a platform, a chamber mounted thereon, air and steam supply pipes extending within the chamber, the steam-supply pipe being connected to a forward projecting rod which serves the purpose of an excavating-tool by discharging the steam upon the frozen soil, a conveyer-belt for taking the soil so excavated toward the rear of the platform, and an engine for operating the carrier-belt, substantially as shown and for the purpose set forth.

3. In an apparatus for mining or excavating frozen soil consisting of a platform, an excavating-tube through which steam is ejected upon said soil, an endless conveyer mounted on the platform, and wings or shields the lower ends of which converge toward the endless carrier, substantially as shown.

4. In an apparatus for mining in frozen soil, the combination of a movable platform having mounted thereon a suitably-driven conveyer, a separator mounted on the platform adjacent to one end of the conveyer said separator being actuated from the same source of power that operates the conveyer, a closed chamber carried by the platform, and a tube which extends through the chamber said tube being of sufficient length to extend forward of the conveyer, a steam-supply pipe connected with the tube and with the source of power which drives the conveyer, the steam being exhausted beneath the separator, substantially as shown and for the purpose set forth.



5. In an apparatus for mining or tunneling in frozen soil, the combination with an apparatus comprising a platform, means for manually moving the same, said platform carrying a chamber, engine, conveyer, separator and steam-ejecting pipe, organized or assembled as shown, an air-supply pipe connected with the chamber, steam-pipes one connected to the excavating-tube and the other with the engine said engine having a pipe for conveying the exhaust-steam therefrom to a point beneath the separator for the purpose set forth.

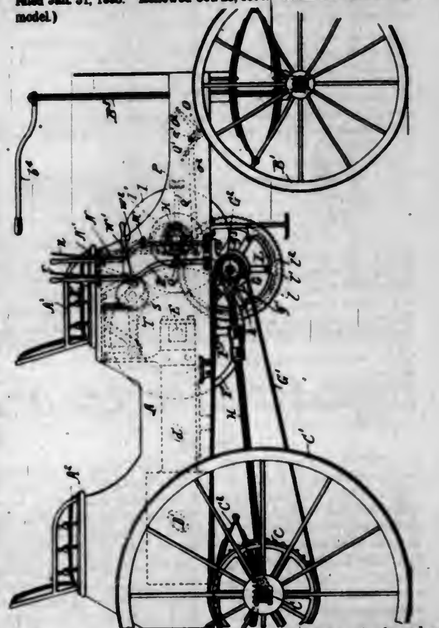
6. In a mining apparatus for tunneling in naturally-frozen soil, the combination with a platform, an endless carrier mounted thereon so that the forward portion thereof will be adjacent to the base of the tunnel, a chamber carried by the platform and positioned thereon to the rear of the forward portion of the endless carrier and a tool connected with a source of heat through which the heated medium is ejected upon the soil, said tool extending through the front wall of the chamber and adapted to be operated from within the chamber, substantially as set forth.

7. In an apparatus for mining or tunneling in naturally-frozen soil, the combination with a platform or support, a chamber mounted thereon and an excavating-tool which is connected with a steam-supply pipe, said tool being supported by the front wall of the chamber, the end beyond the chamber being of such length that the tool can operate over an area larger than the area of the platform and parts carried thereby, substantially as shown.

604,331. FOLDING ROAD-VEHICLE. WILLIAM LEGGE, London, England, assignor to the Patent Folding Perambulator Company, Limited, Croydon, England. Filed Dec. 29, 1897. Serial No. 664,231. (No model.) Patented in England Dec. 7, 1893, No. 23,567.

Claim.—1. In a folding road-vehicle or the like and in combination with the side pieces and an undivided bottom piece which is hinged on one edge to one of the side pieces, a hinge connected to the opposite side piece and to the bottom piece and adapted after the latter has been raised to automatically assist the closing of the sides substantially as described.

2. In a folding road-vehicle or the like and in combination two side pieces, a part situated between same and adapted when at right angles to such sides to keep same apart a hinge connecting said part with one of the side pieces by one edge of the former and a double hinge connected to the other side piece and to said part about the middle of same so that its other edge is free to move substantially as described.



3. In a folding road-vehicle or the like, and in combination two side pieces, a bottom piece, a hinge connecting said bottom piece with one of the side pieces, by one edge of the former, a double hinge connected to the other side piece and to the bottom piece about the middle of same so that its other edge is free to move, and flexible stays attached to each side piece and extending to the opposite side piece to stiffen same when open substantially as described.

4. In a folding road-vehicle or the like and in combination two side pieces, a bottom piece adapted to fold against the side pieces, hinged parts situated below said bottom piece adapted when the vehicle is open to stiffen the side pieces and means connecting the bottom and said part beneath so that as the bottom is raised to fold the side pieces together the part beneath is drawn up substantially as described.

5. In a folding road-vehicle or the like and in combination with two side pieces and a bottom piece adapted to fold up with the side pieces a stay G pivoted to one of the sides a rod H pivoted centrally to same and to the opposite side the stay and rod being adapted to lie snugly together when the vehicle is open substantially as described.

6. In a folding road-vehicle or the like and in combination two side pieces, a bottom piece adapted to fold against the side pieces and, a piece hinged to one of the side pieces so as to fold against same and adapted when open to lock the bottom piece substantially as described.

604,882. VEHICLE-MOTOR. GEORGE W. LEWIS, Chicago, Ill. Filed Jan. 31, 1895. Renewed Oct. 25, 1897. Serial No. 656,319. (No model.)

Claim.—1. The combination with vehicle driving-wheels and a prime mover, of a friction driving-gear comprising a shaft which is actuated by the prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys on the second shaft which are movable in a direction endwise of the shafts relatively to the pulleys on the first shaft, the pulleys on the two shafts being located at different distances apart and means applied to the second shaft for giving lateral movement to the same, substantially as described.

2. The combination with vehicle driving-wheels and a prime mover of a friction driving-gear, comprising a shaft which is actuated by the prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys mounted to slide endwise on the second shaft and rigidly connected with each other and means applied to move laterally the second shaft, substantially as described.

3. The combination with vehicle driving-wheels and a prime mover of a friction driving-gear, comprising a shaft which is actuated by the prime mover, two friction-pulleys of different sizes mounted on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys mounted to slide endwise on said second shaft actuating means connected with said pulleys for moving them endwise on the shaft and means applied to the second shaft for giving lateral movement to the same, substantially as described.

4. The combination with vehicle driving-wheels and a prime mover of a friction driving-gear, comprising a shaft which is actuated by the prime mover, two friction-pulleys of different sizes mounted on the said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys arranged to slide endwise on said second shaft and rigidly connected with each other, and means for moving said pulleys on the shaft, comprising an oscillating arm connected with a ring which engages a groove in the hub of one of the pulleys, a hand-lever and a connecting-bar uniting the hand-lever with said oscillating arm, substantially as described.

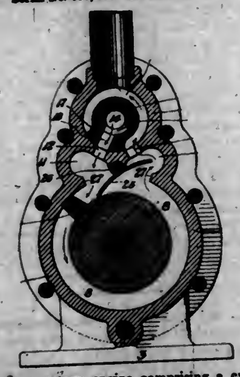
5. The combination with vehicle driving-wheels and a prime mover, of a friction driving-gear, comprising a shaft which is actuated by the prime mover, two friction-pulleys of different sizes mounted on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from same, two friction-pulleys on said second shaft which are movable relatively to the pulleys on the first shaft, a laterally-movable bearing for one end of said second shaft, an upright arm at the free end of which said bearing is attached, and an actuating device connected with said bearing for giving lateral movement with the said second shaft, substantially as described.

6. The combination with vehicle driving-wheels and a prime mover of a friction driving-gear, comprising a shaft which is actuated by a prime mover, two friction-pulleys of different sizes mounted thereon, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys on said second shaft which are movable relatively to the pulleys on the first shaft a movable bearing for one end of the said second shaft and means connected with said movable bearing for shifting said shaft laterally, consisting of a rock-shaft provided with a crank-arm which is connected with said bearing and with an actuating-lever and a spring applied to one of said bars to throw the second shaft away from the first shaft, substantially as described.

7. The combination with vehicle driving-wheels and a prime mover of a friction driving and brake gear, comprising a shaft which is actuated by a prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys of different sizes mounted on the second shaft and movable relatively to the pulleys on the first shaft, a friction-strip arranged parallel with the said shafts in position for contact therewith of the larger of the pulleys on the second shaft and means for giving lateral movement to said second shaft, substantially as described.

8. The combination with vehicle driving-wheels and a prime mover, of a friction driving and brake gear, comprising a shaft which is actuated by a prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the same, two friction-pulleys of different sizes mounted on the second shaft and movable relatively to the pulleys on the first shaft, a friction-strip arranged parallel with the said shafts in position for contact therewith of the larger of the pulleys on the second shaft, a laterally-movable bearing for one end of said second shaft and means for moving laterally the second shaft, comprising a rock-shaft provided with a crank-arm which is connected with the bearing and provided also with two foot-levers, one for throwing the friction-pulleys into engagement with each other the other for throwing the larger friction-pulley into contact with the said friction-strip, substantially as described.

9. The combination with vehicle driving-wheels and a prime mover, of a combined friction and spur gear driving device, comprising a shaft which is actuated by the prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable laterally toward and from the first shaft, two friction-pulleys on the said second shaft which are movable relatively to the pulleys on the first shaft, a third shaft having operative connection with the driving-wheels, two spur-gears of different sizes on said third shaft, two spur-gears of different sizes mounted on said second shaft and movable relatively to those on the third shaft and means for giving lateral movement to said spur-gears on the second shaft, substantially as described.



10. The combination of vehicle driving-wheels and a prime mover of a combined friction and spur gear driving device, comprising a shaft which is driven by the prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable both laterally and endwise, two friction-pulleys of different sizes mounted to move endwise on the second shaft, a third shaft having operative connection with the driving-wheels, two spur-gears of different sizes on said third shaft two spur-gears of different sizes secured to the second shaft and adapted for engagement with the spur-gears on the third shaft by endwise movement of said second shaft and means for giving endwise movement to said second shaft, substantially as described.

11. The combination with vehicle driving-wheels and a prime mover, of a combined friction and spur gear driving device, comprising a shaft which is driven by the prime mover, two friction-pulleys of different sizes on said shaft, a second shaft arranged parallel with the first shaft and movable both endwise and laterally, two friction-pulleys mounted to slide endwise on said second shaft, said pulleys being rigidly connected with each other, a third shaft having operative connection with the driving-wheels, two spur-gears of different sizes on said third shaft, two spur-gears of different sizes rigidly attached to said second shaft, a laterally-movable bearing for one end of said second shaft, an actuating-lever connected with said movable bearing for giving lateral movement to the said second shaft, an actuating-lever connected with said pulleys on the second shaft for moving them endwise on said shaft and an actuating-lever connected with said second shaft for giving endwise movement to the latter, substantially as described.

12. The combination of vehicle driving-wheels and a prime mover, of friction driving and reversing gear, comprising a shaft which is actuated by the prime mover, a second shaft arranged parallel with the first shaft and movable toward and from the same, two friction-pulleys of unequal sizes on the first shaft, two friction-pulleys of different sizes mounted on the second shaft and movable thereon relatively to the pulleys on the first shaft, gearing connecting said second shaft with the driving-wheel, means applied to the said second shaft for moving it toward and from the first shaft and a laterally-movable reversing-pulley adapted for contact with said friction-pulleys for reversing the direction of rotation of the second shaft, substantially as described.

13. The combination with vehicle driving-wheels and a prime mover, of a friction driving and reversing gear, comprising a shaft which is actuated by the prime mover, a second shaft arranged parallel with the first shaft and movable toward and from the same, friction-pulleys on said shafts, a laterally-movable reversing-pulley, a shaft on which said reversing-pulley is mounted, a pivotal arm affording a bearing for one end of said reversing-pulley shaft and means for giving lateral movement to the reversing-pulley, comprising a lug or projection on said pivoted arm provided with a holding notch and a rock-shaft provided with a cam-arm adapted for engagement with said lug or projection, substantially as described.

604,333. ROTARY STEAM-ENGINE. FRANK D. MOON, Lockport, N. Y., assignor of three-twentieths to Lucius F. Adams and Joshua Gaskill, same place, and Frederick S. Jackson, Holland, N. Y. Filed May 14, 1897. Serial No. 636,532. (No model.)

Claim.—1. In a rotary engine comprising a cylinder, a drum mounted therein provided with an abutment, a valve-chamber located to one side of the cylinder, a valve mounted therein, and a double acting rock-valve pivotally mounted between the valve-chamber and the cylinder with means for actuating the rock-valve: intervening pocket-chambers between the valve-chamber and the cylin-

der constituting enlarged communicating passages for supply and exhaust steam around the ends of the rock-valve, substantially as set forth.

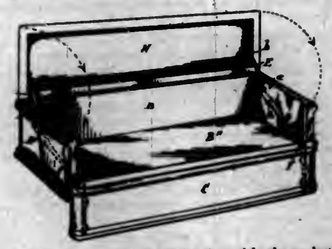
2. A rotary engine comprising a cylinder, a drum mounted therein provided with an abutment, a valve-chamber located to one side of the cylinder, a valve mounted therein, intervening pocket-chambers between the valve-chamber and the cylinder formed into enlarged laterally-extended cavities, a double-acting rock-valve pivoted between the pocket-chambers adapted to open and close communication between such chambers and the cylinder, a cam-arm on the rock-valve shaft and means attached to the main shaft for operating the cam to actuate the rock-valve, substantially as set forth.

3. In a rotary engine provided with a cylinder and a drum mounted therein provided with an abutment, a double-acting pivoted rock-valve with its inner face conforming to the inner face of the cylinder and a valve-chamber located to one side of the cylinder with a valve mounted therein; intervening pocket-chambers between the valve-chamber and cylinder having extended lateral cavities allowing for free circulation around the ends of the rock-valve when deflected and contracted to meet the edges of said valve when closed, substantially as set forth.

4. The combination, in a rotary engine, of a cylinder, a drum mounted therein provided with an abutment, a valve-chamber located to one side of the cylinder, intervening pocket-chambers between the valve-chamber and the cylinder, a double-acting rock-valve pivoted between the pocket-chambers with its inner face curved to conform to the inner face of the cylinder, a double-arm cam on the valve-stem, a disk on the main shaft provided with a roller for engagement therewith, and a rotary valve mounted on an inlet-barrel in the valve-chamber and adapted to open supply and exhaust passages leading to the intervening pocket-chambers; substantially as set forth.

5. In a rotary engine, the combination of a cylinder, a drum mounted therein provided with an abutment, a plurality of valve-chambers located laterally to the cylinder with valves mounted therein, means for simultaneously reversing the valves, intervening pocket-chambers between the valve-chambers and the cylinder, constituting enlarged communicating passages for supply and exhaust steam around the ends of the rock-valves, double-acting rock-valves pivoted centrally between the pocket-chambers with their inner faces curved to conform to the inner face of the cylinder, actuating-cams on the valve-stems and a disk on the main shaft provided with a roller for engagement therewith, substantially as set forth.

6. In a rotary engine comprising a cylinder, a drum mounted therein provided with an abutment, a valve-chamber located to one side of the cylinder, a valve mounted therein, a double-acting rock-valve pivotally mounted between the valve-chamber and the cylinder, and intervening pocket-chambers between the valve-chambers and the cylinder constituting enlarged communicating passages for supply and exhaust steam around the ends of the rock-valve; a double-arm cam with a concave recess between the arms, mounted on the end of the rock-valve shaft and a roller mounted on a disk secured to the main shaft adapted to enter the recess and engage one of the arms, substantially as set forth.

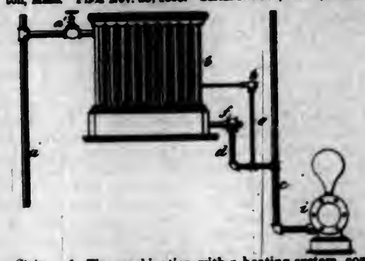


7. The combination, in a rotary engine, of a cylinder, a drum mounted therein provided with an abutment, a valve-chamber located to one side of the cylinder, intervening pocket-chambers between the valve-chamber and the cylinder, a double-acting rock-valve pivoted between the pocket-chambers with its inner face curved to conform to the inner face of the cylinder, a cam on the valve-stem, a disk on the main shaft provided with a roller for engagement therewith, and a rotatory valve mounted on the inlet-barrel in the valve-chamber and adapted to open supply and exhaust passages leading to the intervening pocket-chambers; substantially as set forth.

8. The combination, in a rotary engine, of a cylinder, a drum mounted therein provided with an abutment, a valve-chamber located to one side of the cylinder, intervening pocket-chambers between the valve-chamber and the cylinder, a double-acting rock-valve pivoted between the pocket-chambers with its inner face curved to conform to the inner face of the cylinder, a cam on the valve-stem, a disk on the main shaft provided with a roller for engagement therewith and a valve in the valve-chamber adapted to open supply and exhaust passages leading to the intervening pocket-chambers, substantially as set forth.

604,884. BURIAL-CASKET. CHARLES B. MYERS, Detroit, Mich., assignor of one-half to James G. Barton, same place. Filed Oct. 16, 1897. Serial No. 655,283. (No model.)

Claim.—1. In a burial-casket, the combination with the casket-shell, of the vertically-movable side, the hinged lid mounted on the fixed portion of the casket, and means connecting said movable side with said hinged lid to effect a vertical movement of said side as said lid is opened and closed.



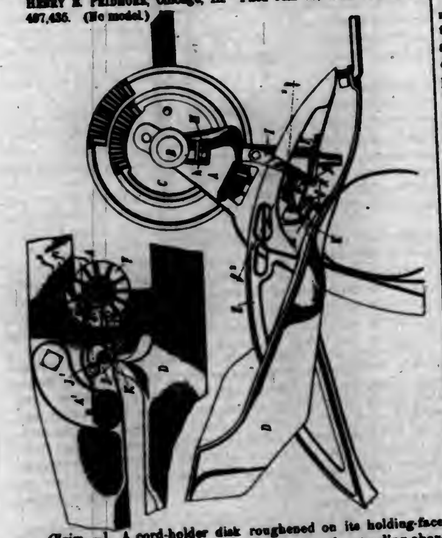
2. In a burial-casket, the combination of the rigid portion of the casket-shell, of the vertical movable side thereof, the hinged lid mounted on the fixed portion of the shell, and the levers and links connecting said lid with said movable side.

3. In a burial-casket, the combination with the casket-shell, of the side mounted to move vertically thereon, the hinged lid, the pivoted levers connected with said lid, and the jaws carried by said movable side engaged by the ends of said levers.

4. In a casket, the combination with the fixed portion of the casket-shell comprising the bottom, ends, and one side, of the complementary portion of said shell consisting of a movable side, the lid hinged to the fixed side of the shell, and means connecting said lid with said movable side to effect a movement thereof as the lid is opened and closed.

604,885. STEAM-HEATING SYSTEM. ANDREW G. PAUL, Boston, Mass. Filed Nov. 25, 1895. Serial No. 569,900. (No model.)

Claim.—1. The combination with a heating system, comprising a radiator or heater and a supply-pipe, of a discharge-pipe having a branch or passage connected with that part of the system where the water of condensation collects and an automatic steam-trap in said branch and a second branch or passage connected with the system on the supply side of the steam-trap above the point where the water of condensation ordinarily collects, and an exhausting device connected with the discharge-pipe whereby the water of condensation is intermittently discharged through the first branch and the air is discharged through the second branch, substantially as set forth.



2. The combination with a heating system, comprising a radiator or heater and a supply-pipe, of a discharge-pipe having a branch or passage connected with that part of the system where the water of condensation collects, and an automatic steam-trap in said branch and a second branch or passage connected with the system on the supply side of the steam-trap above the point where the water of condensation ordinarily collects, and an automatic air-valve in said branch, and an exhausting device connected with the discharge-pipe, whereby the water of condensation is intermittently discharged through the first branch and the air is intermittently discharged through the second branch, substantially as set forth.

3. The combination with a heating system, comprising a radiator or heater and a supply-pipe, of a discharge-pipe having a branch connected with the lower part of the radiator or heater, an automatic steam-trap consisting of a valve device in said branch, and a second branch connected with the radiator or heater above the point where the water of condensation ordinarily collects, a trap consisting of a valve device in the discharge-pipe, a relief-pipe connected with the discharge-pipe, and an exhauster with which the relief-pipe is connected, substantially as set forth.

4. The combination with a heating system, comprising a radiator or heater and a supply-pipe, of a discharge-pipe having a branch connected with the lower part of the radiator or heater, an automatic steam-trap consisting of a valve device in said branch, and a second branch connected with the system on the supply side of the steam-trap above the point where the water of condensation ordinarily collects, an automatic air-valve in said branch, a trap consisting of a valve device in the discharge-pipe, a relief-pipe connected with the discharge-pipe and an exhauster with which the relief-pipe is connected, substantially as set forth.

5. The combination with a heating system, comprising a radiator or heater and a supply-pipe, of a discharge-pipe having a branch connected with the lower part of the radiator or heater, an automatic steam-trap consisting of a valve device in said branch, and a second branch connected with the system on the supply side of the steam-trap above the point where the water of condensation ordinarily collects, an automatic air-valve in said branch, a trap consisting of a valve device in the discharge-pipe, a relief-pipe connected with the discharge-pipe and provided with a restricted passage, and an exhauster with which the relief-pipe is connected, substantially as set forth.

604,886. CORD-KNOTTER FOR SELF-BINDING HARVESTERS. HENRY R. PRIDMORE, Chicago, Ill. Filed Jan. 19, 1894. Serial No. 497,436. (No model.)

Claim.—1. A cord-holder disk roughened on its holding-face, and having a hub roughened on its periphery and extending above the face.

2. A cord-holder disk provided with grooves or serrations on its holding-face, and having a hub formed with grooves or serrations in lines at substantially a right angle to the plane of the disk.

3. A cord-holder disk provided with radial grooves or serrations on its holding-face, and having a hub formed with longitudinal peripheral grooves or serrations forming continuations of those of the disk.

4. A cord-holder disk having two notches in its periphery, the segment of the disk between the notches having a greater diameter than the main portion of the disk.

5. A cord-holder disk having two notches in its periphery, the segment of the disk between the notches having a greater diameter than the main portion, and a knife secured to part of the greater diameter.

6. In a cord-knotter, the combination of a holder-disk having two notches in its periphery, the segment of the disk between the notches having a greater diameter than the main portion, a guide extending downward from the knotter-frame above the disk and secured to the holder so as to form a loop to admit the needle-point and a guide to direct the cord into the disk-notches, and a knife mounted on the part of the disk of the greater diameter and adapted to rotate outside the guide.

7. In a cord-knotter, the combination of a holder-disk, a holder integral with the knotter-frame, a spring to hold the disk against the holder, and a cord-guide extending from the holder outwardly and upwardly so as to form a loop for the passage of the needle's point, said guide being connected at its upper end to the knotter-frame.

8. In a cord-knotter, the combination of a holder-disk, a holder integral with the knotter-frame, a spring to hold the disk against the holder, and a cord-guide secured at its upper end to the knotter-frame and extending downwardly and forming a loop for the passage of the needle and a guide to direct the cord into the holder, said guide being continued under the cord and secured to the holder so as to act as a support for the cord.

9. In a cord-knotter, the combination of the holder integral with the knotter-frame, a holder-disk, a spring to hold the disk against the holder, and a cord-guide extending from the holder outwardly and upwardly and connected at its upper end to the knotter-frame so as to form a loop for the passage of the needle-point, said guide being extended beneath the holder so as to form a bearing-face for the disk.

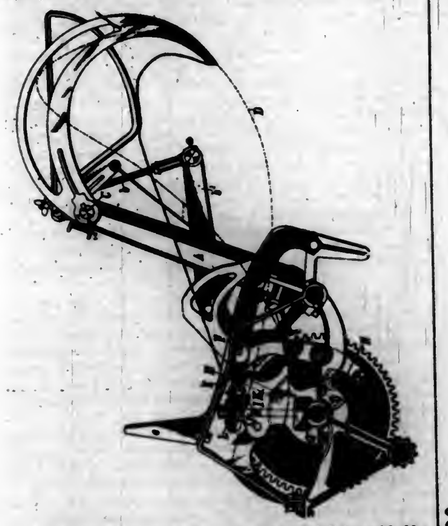
10. In a cord-knotter, the combination with the looper trending normally in the direction of the discharge of the bundle, and the slotted breastplate, of a guiding-finger projecting from the side of the slot opposite the looper and having its active face so inclined in the general direction of the movement of the cord as to guide and deflect the same to the opposite side of the slot nearest the looper without arresting it, and a stop and support for the cord on the side of the slot next the looper, said guide-finger overhanging the stop and acting to hold the cords thereon during the knot-forming operation.

11. In a cord-knotter, the combination with the looper trending normally in the direction of the discharge of the bundle, and the slotted breastplate, of a guiding-finger projecting from the side of the slot opposite the looper, and a stop and support for the cord in rear of the guiding-face of the finger, said guiding-face inclined at all points in the direction of the movement of the cord, whereby the finger acts to guide the cord toward and upon the stop and serves to prevent it from slipping off the same during the knot-forming operation.

12. In a cord-knotter, the combination with the looper trending normally in the direction of the discharge of the bundle, and the slotted breastplate, of a guiding-finger that projects from the side of the slot opposite the looper and acts to deflect the cord to the side of the slot toward the looper, and a stop and support for the cord on the side of the slot next the looper, the outer edge of said stop or rest being inclined upwardly and acting to prevent the cord from slipping off the support during the knot-forming operation.

13. In a cord-knotter, the combination with the looper trending normally in the direction of the discharge of the bundle, and the slotted breastplate, of a guiding-finger projecting from the side of the slot opposite the looper and acting to deflect the cord to the side of the slot toward the looper, and a stop and support for the cord on the side of the slot next the looper, said guide-finger trending outwardly and inclined upwardly so as to overhang the stop or rest, and the outer edge of the stop itself being inclined upwardly in rear of the finger and acting to prevent the cord from slipping off the support during the knot-forming operation.

14. In a cord-knotter, the combination with the looper trending normally in the direction of the discharge of the bundle, and a slotted breastplate, of a guiding-finger projecting from the side of the slot opposite the looper and having its active face so inclined in the general direction of the movement of the cord as to guide and deflect the same to the opposite side of the slot nearest the looper without arresting it, the edge of the slot on the looper side being inclined transversely to the direction of movement of the cord to arrest the same and form a stop and support therefor, and the free end of the guiding-finger overhanging the said inclined edge of the slot in front and rear of the said inclined edge and acting to prevent the cord from slipping off the support during the knot-forming operation.



15. In a cord-knotter, the combination with the looper trending normally in the direction of the discharge of the bundle, and the slotted breastplate, of a guiding-finger projecting from the side of the slot opposite the looper and having its active face so inclined in the general direction of the movement of the cord as to guide and deflect the same to the opposite side of the slot without arresting it, the edge of the slot on the looper side being inclined transversely to the direction of movement of the cord to form a stop and support for the same, and the guiding-finger being widened and flattened toward its free end so as to overhang the inclined edge of the slot, whereby the end of said finger acts to hold the cord on the support and prevent the same from slipping therefrom during the knot-forming operation.

16. In a grain-binder, the combination of the needle, the cord-holder, and the slotted breastplate, of a finger projecting from one side of the breastplate-slot into and across the same with its active face so inclined in the general direction of the outward movement of the cord as to guide and deflect the same to the opposite side of the slot without arresting it, and the opposite edge of the slot being deflected into a generally-perpendicular direction to the movement of the cord at the point where the finger crosses the slot, whereby the deflected edge of the slot receives the cord from the finger and arrests and holds it against farther outward movement.

604,887. CORD-KNOTTING DEVICE. HENRY R. PRIDMORE, Chicago, Ill. Filed Feb. 23, 1895. Serial No. 539,327. (No model.)

Claim.—1. In a cord-knotting device, the combination with the

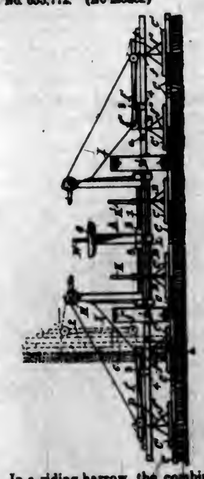
cam-wheel, of the holder and the looper, the shafts of said holder and looper being substantially radial to the cam-wheel and parallel with the face of the wheel and located between it and the plane of the needle, the looper-shaft being set back from the needle's plane farther than the holder-shaft, and the holder pinion being driven by a gear tooth or segment on the side of the cam-wheel in a plane set out farther from the face of the wheel than the segment that drives the looper-pinion.

2. In a cord-knotting device, a rotary flanged disk cord-holder, the cord-receiving notches of which are provided with lips that project from the flange of the disk, a clamping-shoe, a guide projecting from the shoe toward the lip of the flange and that with the lip of the disk forms a support for the cord and guides it into the notch as the holder is rotated.

3. In a cord-knotting device, in combination a holder mounted upon a radial shaft and driven directly from the cam-wheel, a looper also mounted upon a shaft driven from the same cam-wheel, the looper being positioned in a plane farther from the plane of the path of the needle than the holder, the holder receiving the cord on its side toward the needle in a notch formed with a lip projecting from the same in the direction of movement of the holder, a cord-holding shoe having a guide-finger projected beyond its holding-surface in a reverse direction to the movement of the holder, in the same horizontal plane with the lip on the holder, whereby the cord is prevented from escaping the notch in the holder, as the holder continues its rotation.

4. In a cord-knotting device, in combination substantially as set forth, a holder and looper on the same side of the plane of the path of the needle, and actuated directly from a common cam-wheel, the looper being set back from the plane of the path of the needle farther than the holder, a cord-guide on the breastplate on the side of the looper toward the bundle, against which guide the incoming grain forces the holder-strand of cord, a compressor moving forward against the formed bundle and lifting it away from the guide whereby the needle-strand of the cord is permitted to slide down the guide to its point within the path of the rotation of the looper.

5. In combination in a cord-knotting device, a holder located on one side of the looper, a cord-guide located on the other side; the holder adapted to carry the cord in its rotation toward the looper, the cord-guide formed with a cam or boss along which the cord slides toward the looper and a compressor independent of the needle to force the formed bundle from the cord-guide, substantially as and for the purpose specified.



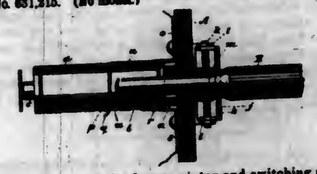
604,838. ART OF TREATING TOBACCO-LEAVES. CLYDE A. RICKARD and EDWARD H. LOUD, Seville, Ohio. Filed Oct. 18, 1895. Serial No. 566,129. (No specimens.)

Claim.—1. An improvement in the art of treating tobacco-leaves, which consists in applying a combustion-promoting agent to the leaves of a growing plant, substantially as described.

2. An improvement in the art of treating tobacco leaves, which consists in applying an alkali to the leaves of a growing plant in spots, substantially as described.

3. An improvement in the art of treating tobacco-leaves which consists in applying a mixture of potash and glycerin to the leaves of a growing plant in spots, substantially as described.

604,839. RIDING-HARROW. MYRON ROWE, Clarksville, Iowa, assignor of one-half to Nelson J. Walrath, same place. Filed Oct. 2, 1897. Serial No. 653,772. (No model.)



Claim.—1. In a riding-harrow, the combination with a central or main frame-section, having one or more drags suspended therefrom, of lateral or wing frames hinged or pivoted at their inner edges to the central or main frame-section, one or more drags flexibly suspended from each of said lateral or wing frames, means whereby each of the said drags may be raised or lowered toward and away from the respective frame-sections independently of the others, and means whereby each wing-section with its drag or drags may be raised on its hinge or pivot connection with the main or central frame-section, substantially as specified.

2. In a riding-harrow, the combination of a frame, consisting of a central wheel-supported section, and laterally-extending wing-sections hinged or pivoted to said central section, one or more drags flexibly suspended from each of the said sections underneath the same, windlasses mounted upon the said central section, ropes or the like connected to said windlasses and to the drags of the lateral sections, said ropes having an intermediate bearing on said lateral sections, whereby by a partial operation of said windlasses, the drags may be raised toward the under side of said sections, and by a further operation, the said sections will be raised on their hinge connections and carry the drags with them, means for supporting the sections when so raised, and means for supporting the drags in raised positions on the sections, substantially as specified.

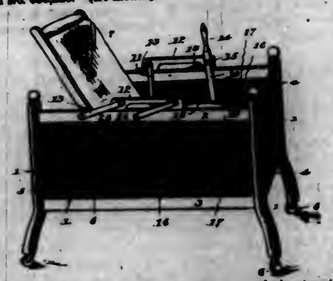
3. In a riding-harrow, the combination with a main frame-section having one or more drags suspended therefrom, of a lateral or wing frame-section hinged or pivoted to said main frame-section, two independent drags flexibly suspended from the said lateral or wing section, a windlass mounted upon the main frame-section, and two independent ropes or cables which connect the said windlass with the respective drags, said ropes having means whereby they may be operated independently of the windlass, means for locking said windlass in the desired position, and means on the under side of the lateral or wing section for supporting its drags thereon when the said section is raised on its hinge or pivot connection, substantially as specified.

4. In a riding-harrow, the combination of the main section, the lateral or wing sections hinged or pivoted thereto and adapted to be raised into substantially vertical positions, the independent drags suspended from said main and lateral or wing sections, the two windlasses mounted on the main section, ropes or the like running from each windlass to each of the said drags on the wing-sections and having intermediate bearings on the said sections, said ropes being also arranged to be operated individually independently of the windlasses, means for holding said drags in position on the sections when raised, and means for raising the drag or drags of the main section, substantially as specified.

604,840. COMBINED ANNUNCIATOR AND SPRING-JACK. GEORGE W. SUTTON, New Rochelle, N. Y., assignor to the Phœnix Interior Telephone Company, New York, N. Y. Filed Apr. 5, 1897. Serial No. 631,215. (No model.)

Claim.—1. In a combined annunciator and switching structure, the combination of a plug and switching device, and an apertured "drop," the aperture in the said "drop" being so located as to bar access by the plug to the said switching device when the "drop" is in position to indicate a call and to allow the plug to have access to the said switching device when the "drop" is in its reset position, whereby the "drop" may be reset by the act of inserting the plug to operate the switching device.

2. In a combined annunciator and spring-jack, the combination of a switching device, a movable apertured "drop" having its aperture so located as to allow access to the switching device when the "drop" is in its set position and to prevent access thereto except when in said set position, whereby when the "drop" is in position to indicate a call the switching device can be operated by a switching-plug only by inserting the said switching-plug through the aperture in the "drop," all combined with means for limiting the movement of the "drop."



3. In a combined annunciator and spring-jack, the combination with a spring-jack switch of an apertured shutter mounted in front of the said spring-jack switch having its aperture so located as to allow the switching-plug to have access to the spring-jack switch only when the shutter is in its set position and to bar access to the spring-jack switch when the shutter is in position to indicate a call, whereby the spring-jack plug will be ineffective to operate the spring-jack except by being passed through the aperture in the shutter and into the spring-jack switch and thereby resetting the shutter.

4. In a combined annunciator and switching device which is accessible through an opening, the combination with the said switching device of a plug, a movable apertured annunciator having its aperture so arranged as to register with the opening when in its set position so as to admit the plug to actuate the switching device and to bring a solid portion in front of the said opening when the said shutter is thrown out of registry by being actuated.

5. The combination of a switching device and an apertured pivoted shutter barring access to the said switching device, except through the aperture thereof, whereby a plug for operating the switching device must be passed through the shutter to reset the same, substantially as described.

6. In a spring-jack switch, the combination of a contact *n* having a bent portion *p*, of a contact-spring *r* having a cam *t* and a bent portion *q* adapted to contact with the bent portion *p* of the contact *n* with a rubbing motion.

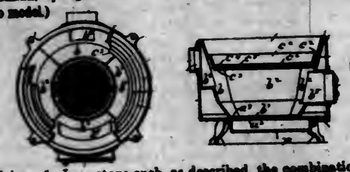
604,841. COMBINED CHAIR, CRIB, CRADLE, BED, AND WALKER. FRANK A. TOTTMAN, Montana, Kans. Filed May 12, 1897. Serial No. 636,230. (No model.)

Claim.—1. The combination of a frame a chair structure suspended within the frame by swinging arms, and adjustable connections between the swinging arms and the frame, whereby the chair structure may be adjusted longitudinally of the frame, substantially as specified.

2. The combination of a frame having antifriction supporting devices, a chair structure suspended within the frame by swinging arms, and adjustable connections between the swinging arms and the frame whereby the chair structure may be adjusted longitudinally of the frame, substantially as specified.

3. The combination of a frame, supporting-bars mounted upon the frame for adjustment longitudinally thereof, swinging arms carried by the supporting-bars, and means for supporting an occupant suspended by said swinging arms, substantially as specified.

4. The combination of a supporting-frame, a sectional chair structure suspended for swinging movement within and longitudinally of the frame, and means for securing the sections of the chair structure in the desired relative positions, substantially as specified.



5. The combination of a supporting-frame, supporting-bars resting upon the upper edges of the sides of the frame, links connecting the supporting-bars with the frame, whereby the supporting-bars may be adjusted longitudinally of the same, swinging links suspended from the supporting-bars, and a sectional chair structure supported by the swinging arms, substantially as specified.

6. The combination with a supporting-frame, of side swinging arms pivotally mounted at their upper ends on the frame, an occupant-supporting device suspended by said swinging arms within the frame, and an operating-handle provided with a clasp constructed to fit upon and detachably engage the upper end of one of said swinging arms, whereby oscillatory motion may be imparted to the occupant-supporting device by an attendant, substantially as specified.

7. The combination with a supporting-frame, of a sectional chair structure suspended by swinging arms within said frame, and including a seat-section, a foot-section having arms pivotally mounted upon the seat-section, a back-section pivotally mounted upon the seat-section, side arms connecting the back-section with the upper extremities of the arms of the foot-section, perforated segments carried by the seat-section, spring actuated latches pivotally mounted upon the back-section to engage the perforations of said segments, and contiguous bell-crank operating-levers 24 mounted upon the back-section at its upper end and respectively connected by independent means with said latches, substantially as specified.

8. The combination with a supporting-frame, of a sectional chair structure having pivotally-connected seat, back and foot sections, and means for securing the same at the desired relative adjustment, and spaced front and rear swinging arms supported at their upper ends with the said frame and pivotally connected at their lower ends respectively to the seat near its front edge and the back-section near its pivotal connection with the seat, whereby when the back and foot sections are adjusted at an inclination to the seat-section, the rear edge of the seat-section is depressed below its front edge, substantially as specified.

604,842. PORTABLE FARM-STOVE. JOHN WEBB and MICHAEL TURNER, Springfield, Ohio. Filed Mar. 9, 1897. Serial No. 626,592. (No model.)

Claim.—1. In a stove such as described, the combination with an outer casing, of a base secured thereto, a grate adapted to fit in a central opening in said base, and a sectional lining extending outwardly and upwardly from said grate to the upper edge of said casing at an angle to the outer casing, forming a conical chamber as described, and removable tapering rings extending from the top of said casing into said conical chamber at approximately the same angle to the outer casing as the sectional lining, substantially as specified.

2. The combination with the outer casing having a flanged ring at the top, and a base having a central opening, an upwardly-projecting peripheral flange about said opening, an inner tapered or conical-shaped partition formed in horizontal sections as described, and extending at an angle from said flange to said upper ring, the respective sections of said partition being formed with overlapping parts, substantially as and for the purposes specified.

3. The combination with the outer casing of the inner removable sectional lining or partition extending downwardly and inwardly to form a tapered or conical fire-pot, flanged fuel and smoke openings in said lining as described, and conical-shaped removable rings having overlapping flanges, said rings adapted to fit into the top of said fire-chamber and into each other substantially as specified.

4. In a stove such as described the combination with a conical chamber having a flue-opening and a flue-conduit as described, of removable conical rings having overlapping flanges extending into said conical chamber and a plate adapted to fit the lowest ring to close said conical chamber at the top, substantially as specified.

604,348. HARROW. ENTLINGER E. WHIPPLE, St. John's, Mich. Filed Feb. 25, 1895. Serial No. 539,711. (No model.)

Claim.—1. A harrow having vertically-movable bearings, turnable tooth-beams therein, and shoes attached to said bearings, substantially as described.

2. A harrow provided with tooth-beams mounted in bearings, each bearing provided with a single downwardly and rearwardly extending shoe secured thereto, each beam having such bearings at both ends, substantially as described.

3. A harrow having independently vertically movable tooth-beams so connected together as to be rocked simultaneously to raise or lower the teeth, yet so as to permit the independent vertical play of each beam, each beam provided with its own supporting-shoes, substantially as described.

4. In a harrow the combination of frame-bars, a tooth-beam carrying teeth, connections or bearings receiving the tooth-beam and confining or connecting the same to the frame-bars, and depending shoes secured to the front portions of said bearings or connections, substantially as described.

5. A tooth-beam, in combination with a curved harrow-tooth so formed for attachment to the beam that the working point of the tooth is raised or lowered by moving the tooth transversely of the beam and longitudinally of itself, said tooth having a longitudinal slot at the butt of the tooth opposite the beam, a washer or clip conforming to and bearing against said tooth at said slotted portion and provided with a holding teat or projection entering the tooth, and a clamping-bolt passing through said parts and the slot of the tooth and provided with a nut, whereby on loosening the nut the tooth and the washer can be shifted independently of the beam to vary the vertical position of the working point of the tooth.

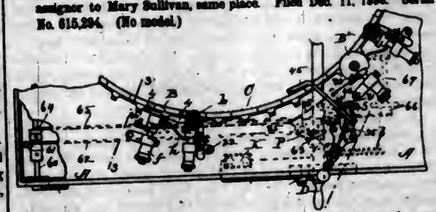
6. A float-harrow having rigid frame-bars, turnable tooth-beams carrying teeth and provided with controlling and operating means, each tooth-beam so connected to the frame-bars as to be movable vertically independently thereof and of the remaining tooth-beams, whereby the individual tooth-beams float independently, each beam provided with its own supporting-shoes, substantially as described.

7. A tooth-beam, in combination with a curved tooth so formed for attachment that the point of the tooth is raised or lowered by moving the tooth transversely of the beam and longitudinally of itself, said tooth having a longitudinal slot opposite the beam, a reversible tooth-clamping means entering said slot and so arranged that on reversal of the means the tooth must be moved longitudinally to vary the working position of its point, substantially as described.

8. In a harrow, the combination of the rigid frame-bars, independently vertically movable bearings loosely confined to the frame-bars, the several turnable tooth-bars carrying curved teeth, each mounted to turn in and move vertically with its bearings, the adjusting-bar arranged above and so connected with all the tooth-bars as to rock the same simultaneously, and yet so as to permit independent vertical movement of any tooth-bar with its bearings, and operating means for the adjusting-bar, substantially as described.

9. In a harrow, the combination of a frame-bar, a bearing carried thereby, a shoe having the upwardly-extending end secured to the front side of said bearing, the shoe from thence extending downwardly and rearwardly beneath the bearing with its upper face adjacent to the under side of the bearing, and a tooth-beam in the bearing, substantially as described.

10. The combination with a harrow frame-bar, of a bearing having a forward projection, a supporting-shoe having its upper portion formed to receive and be locked on said projection, the free end of the shoe extending downwardly and rearwardly therefrom, and a turnable tooth-beam in the bearing, substantially as described.



11. In combination, frame-bars, carriers or supports, tooth-beams carrying teeth and mounted in the supports, and supporting-shoes, each having its upper end secured to a support in advance of the beam with its free end extending downwardly and rearwardly beneath the beam and so arranged that the upward spring of the free end of the shoe is limited by the lower end of the support, substantially as described.

12. In a float-harrow, the combination of frame-bars, a series of tooth-beams carrying teeth and connected with the frame-bars, and a series of downwardly and rearwardly extending tooth-beam-supporting shoes, each tooth-beam directly carried by its own supporting-shoes arranged beneath the same, substantially as described.

13. In a float-harrow, the combination of rigid frame-bars, several vertically-movable tooth-beams carrying teeth and each provided with its own supporting-shoes extending downwardly and rearwardly and moving vertically with the beam and loosely connected with the frame-bars, substantially as described.

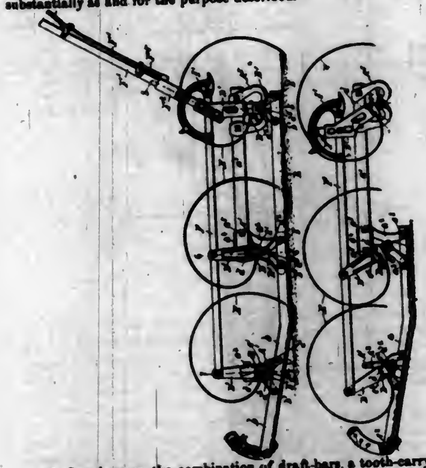
14. In a float-harrow, the combination with rigid frame-bars, a series of independent tooth-beams carrying teeth and arranged beneath the frame-bars, and a series of downwardly and rearwardly extending short shoes arranged beneath the tooth-beams and frame-bars and loosely connected with the frame-bars, each beam provided with a pair of said shoes arranged beneath its end portions and connected thereto, substantially as described.

604,344. STOP MOTION FOR CIRCULAR-KNITTING MACHINES. ALBERT WHITE and DANIEL F. SULLIVAN, Lowell, Mass.; said Sullivan assignor to Mary Sullivan, same place. Filed Dec. 11, 1896. Serial No. 615,294. (No model.)

Claim.—1. In a knitting-machine stop-motion, a drop-wire and a support therefor, in combination with mechanism for automatically engaging the support with said wire and mechanism for disengaging the drop-wire support from said drop-wire by hand substantially as described.

2. In a stop motion for a circular-knitting machine a vertically-movable rotary presser-wheel and mechanism for moving the same vertically in combination with a locking mechanism therefor and releasing devices comprising a drop-wire; and mechanism comprising an electrical circuit closed by the movement of said wheel for projecting a support under said wire.

3. In a stop-motion for circular-knitting machines a rotary presser-wheel mounted on a support 16 in combination with a locking mechanism therefor and releasing mechanism comprising a drop-wire and mechanism for projecting a support under said drop-wire, comprising an electrical circuit closed by the movement of the presser.



4. In a stop-motion for circular-knitting machines a presser mounted on a support 16 in combination with a locking mechanism therefor and releasing mechanism comprising a drop-wire; a shipper; electrically-actuated mechanism started by a movement of said presser for releasing said shipper; and mechanism operated by the movement of said shipper for projecting a support under said drop-wire.

5. In a stop-motion for circular-knitting machines a vertically-movable rotary presser and mechanism for moving the same vertically; an electric circuit; a magnet in said circuit; a presser locking mechanism and releasing devices therefor comprising a drop-wire; a hand-shipper; locking mechanism therefor released by said magnet; and a mechanism for projecting a support under said drop-wire, all being combined and arranged to operate substantially as specified.

604,345. HARROW. HARRY WIARD and HIRAM M. BURDICK, Syracuse, N. Y., assignors, by mesne assignments, to the National Harrow Company, Utica, N. Y. Filed Dec. 26, 1896. Serial No. 616,622. (No model.)

Claim.—1. In a harrow, the combination with teeth; of a frame comprising tooth-carrying bars arranged one in advance of the other, inner and outer draft-bars, said outer draft-bars extending forwardly beyond the front tooth-carrying bar being arranged substantially parallel with each other and having their front ends inclined forwardly toward each other from a point in proximity to the front tooth-carrying bar and having the front extremities of said inclined ends separated from the front extremities of the inner draft-bars, and a front cross-bar connecting the front extremities of the draft-bars of a section and arranged substantially parallel with the tooth-carrying bars, substantially as and for the purpose set forth.

2. In a harrow, the combination with teeth; of a frame comprising tooth-carrying bars arranged one in advance of the other, inner and outer draft-bars extending forwardly beyond the front tooth-carrying bar and having upwardly-inclined front ends, said outer draft-bars being arranged substantially parallel with each other and having their upwardly extending ends inclined forwardly toward each other from a point in proximity to the front tooth carrying bar and having the front extremities of said inclined ends separated from the front extremities of the inner draft-bars, and an elevated front cross-bar connecting the front extremities of the draft-bars of a section and arranged substantially parallel with the tooth-carrying bars, substantially as and for the purpose described.

3. In a harrow, the combination of draft-bars, a tooth-carrying bar having depending arms hinged to the draft-bars and provided with a tooth-supporting surface elevated above the hinge-pin of said tooth-carrying bars, and a tooth secured to said supporting-surface, substantially as described.

4. In a harrow, the combination with spring-teeth; of a frame comprising inner and outer draft-bars disposed in planes substantially parallel with the line of draft, and tooth-carrying bars disposed in planes arranged at substantially right angles with the line of draft and having tooth-supporting surfaces elevated above the top faces of the adjacent portions of the outer draft-bars and having their opposite ends provided with depending arms hinged to the inner and outer draft-bars, and adjusting means for simultaneously adjusting said tooth-carrying bars, substantially as set forth.

5. In a harrow, the combination with spring-teeth; of inner and outer draft-bars, arms projecting upwardly above adjacent portions of said draft-bars and provided at their upper ends with laterally-projecting trunnions or spindles, and tooth-carrying bars having projecting arms provided with journal openings for receiving said trunnions or spindles, substantially as described.

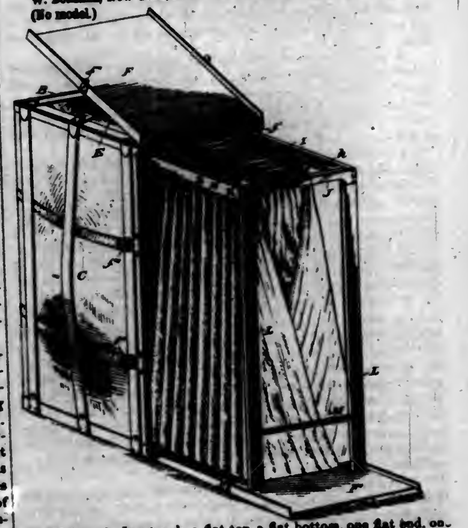
6. In a harrow, the combination of spring-teeth; with the opposite sections of a frame hinged together and each consisting of draft-bars, and tooth-carrying bars having elevated tooth-supporting surfaces arranged beneath the hinge-pins of said sections and having depending arms secured to said draft-bars, substantially as specified.

7. In a harrow, the combination of draft-bars and tooth-carrying bars having channeled under faces arranged above the adjacent portions of the draft-bars, spring-teeth having their attaching ends bearing against said faces of the tooth-carrying bars, fastening-plates arranged beneath said attaching ends above the adjacent portions of the draft-bars and provided with shoulders for entering the channels of the tooth-carrying bars, and clamps for holding said fastening-plates in operative position, substantially as and for the purpose specified.

8. The following elements in combination in a harrow: parallel draft-bars having their front ends deflected upwardly formed in one piece; turnable tooth-bars having perforated angle bends at their ends, perforated brackets secured rigidly to the draft-bars with their free ends extending upwardly, and means for pivotally connecting the angle perforated ends of the tooth-bars and the free ends of the brackets, and means for operating the turnable tooth-bars, substantially as set forth.

9. The following elements in combination in a harrow: draft-bars parallel in portions of their length, tooth-supporting bars at an angle to the line of draft having perforated angle bends at their ends; upwardly-extending brackets rigidly secured to the draft-bars provided with inwardly-extending perforated trunnions to receive the perforated ends of the tooth-bars, means for securing the ends of the tooth-bars and the free end of the bracket together, and mechanism for operating the turnable tooth-bars, substantially as set forth.

10. In a turnable tooth-bar harrow the combination therewith of the bracket having a perforated journal extending from its side, a perforated turnable bar mounted to turn on the journal, and mechanism for securing the parts together, substantially as set forth.



11. In a sectional turnable tooth-bar harrow, the combination therewith of an outer and a short inner draft-bar, parallel in portions of their length, a supplementary bar supported at its front end in an elevated plane above the short bar and at its rear end by a depending support extending into engagement with the soil, substantially as set forth.

12. In a sectional tooth-bar harrow, the combination therewith of an outer draft-bar and a short inner draft-bar parallel in portions of their length, a supplementary short bar supported at its front in an elevated plane above the short draft-bar and at its rear end by a depending support extending into engagement with the soil and the depending support provided with means for supporting and carrying one end of one of the rocking tooth-bars, substantially as set forth.

13. In a harrow of the character described, the combination of the clips provided with projecting journals to receive and support the turnable tooth-bars in a different plane from the plane of the runners, and the turnable tooth-bars supported by the projecting journals in a different horizontal plane from the runners, substantially as set forth.

14. In a sectional harrow, the combination of the following elements: an outside runner and an inside short runner in each section, two elevated short supplemental sections supported in a plane above the plane of the short runners of the harrow-sections, intermediate supports between the rear ends of the short runners and the front ends of the elevated supplemental sections, and a supporting-hinge between the rear ends of the elevated supplemental sections, substantially as set forth.

604,346. DRESS-SKIRT AND WARDROBE TRUNK. SEYMOUR W. BOSSALL, New York, N. Y. Filed Oct. 30, 1897. Serial No. 655,867. (No model.)

Claim.—1. In a trunk, a flat top, a flat bottom, one flat end, one rounded end and two rounded sides, substantially as described.

2. In a trunk, a flat top and bottom, one flat end, one rounded end and two rounded sides; in combination with a sliding hanger and devices adapted to suspend garments between said hanger and said flat end.

3. In a trunk, a slide adapted to move forward when the trunk is on one end, a prop at the forward end of said slide, and a cover-flap hinged to said trunk at one end and adapted when open to afford a bearing for the lower extremity of said prop.

4. A hanger-frame adapted to slide back and forth, said hanger-frame comprising bearing sides and intermediate supporting-bars; in combination with hangers adapted to slide on said supporting-bars.

5. A hanger-frame adapted to slide back and forth, said hanger-frame comprising bearing sides and intermediate supporting-bars; in combination with hangers adapted to slide on said supporting-bars and a prop for said frame attached to its outer end.

604,347. BICYCLE-SADDLE. EDWARD W. BRAY, Indianapolis, Ind., assignor of two-thirds to Franklin A. Williams and Lawson R. Hughes, Needham, Ind. Filed Apr. 20, 1896. Renewed Feb. 28, 1898. Serial No. 672,094. (No model.)

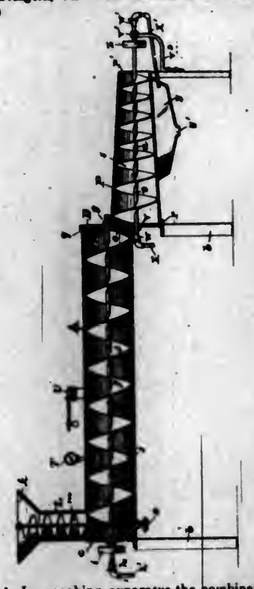
Claim.—1. In a bicycle-saddle, the combination with the two independent parts thereof, of means for supporting each of said parts whereby each of said parts may be given a simultaneous rocking and translatory movement in a substantially vertical plane about a point above the saddle.

2. The combination with a bicycle-saddle consisting of two independent parts, of a pair of hangers pivoted to a suitable support below each of said saddle parts and also pivoted, at their free ends, to the said saddle parts, substantially as described.

3. In a bicycle-saddle consisting of two parts, means for supporting each of said parts consisting of a carrier, a pair of pivoted hangers mounted in said carrier and pivoted at their free ends to said saddle parts, a spring mounted in each carrier and adapted to hold each saddle part in its normal position, and means for securing each of said carriers to the bicycle-frame, substantially as described.

4. In a bicycle-saddle, the combination with a cross-bar adapted to be secured to the bicycle-frame, of a pair of carriers mounted on said cross-bar, a pair of pivoted hangers mounted in each of said carriers, and two independent saddle parts each of which is pivoted to and supported by a pair of said hangers, as and for the purpose set forth.

5. In a bicycle-saddle, the combination with a cross-bar adapted to be secured to a bicycle-frame, of a pair of carriers mounted on said cross-bar, a pair of pivoted hangers mounted in each of said carriers, two independent saddle parts each of which is pivoted to and supported by a pair of hangers, and means for yieldingly holding each of said saddle parts in its normal position.



6 In a bicycle-saddle, the combination with a cross-bar adapted to be secured to a bicycle-frame, of a pair of carriers adapted to be secured to said cross-bar, said carriers each consisting, in part, of a pair of side plates, a pair of pivoted hangers mounted in each carrier between said plates and each provided, at its free end, with a pair of oppositely extending arms which project through suitable slots formed in said side plates, a pair of plates pivoted to each pair of hangers upon the extended arms of the free ends thereof, and a saddle-frame secured to each pair of plates, substantially as set forth.

7. In a bicycle-saddle, the combination with a cross-bar adapted to be secured to a bicycle-frame, of a pair of carriers adapted to be secured to said cross-bar, said carriers each consisting, in part, of a pair of side plates, a pair of pivoted hangers mounted in each carrier between said plates and each provided, at its free end, with a pair of oppositely-extending arms which project through suitable slots formed in said side plates, a pair of plates pivoted to each pair of hangers upon the extended arms of the free ends thereof, a saddle-frame secured to each pair of plates, and means for yieldingly holding each of said saddle-frames in its normal position, substantially as set forth.

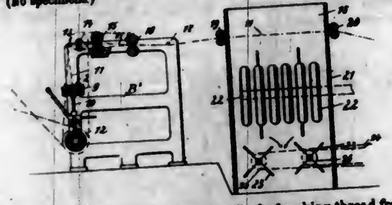
8. In a bicycle-saddle, the combination with a cross-bar adapted to be secured to a bicycle-frame, of a pair of carriers adapted to be secured to said cross-bar and longitudinally adjustable thereon, said carriers each consisting, in part, of a pair of side plates, a pair of hangers pivoted between the side plates of each carrier, each of said hangers being provided, at its free end, with a pair of oppositely-extending arms which project through suitable slots formed in said side plates, a pair of plates pivoted to each pair of hangers upon the extended arms of the free ends thereof, and two parts of a saddle-frame each formed of a single piece of wire bent into the form shown and each secured to one pair of pivoted plates, substantially as set forth.

9. In a bicycle-saddle, the combination with a cross-bar adapted to be secured to a bicycle-frame, of a pair of carriers adapted to be secured to said cross-bar and longitudinally adjustable thereon, said carriers each consisting, in part, of a pair of side plates, a pair of hangers pivoted between the side plates of each carrier, each of said hangers being provided, at its free end, with a pair of oppositely-extending arms which project through suitable slots formed in said side plates, a pair of plates pivoted to each pair of hangers upon the extended arms of the free ends thereof, a saddle-frame composed of two parts each formed of a single piece of wire bent into the form shown and each secured to one pair of pivoted plates, and means for yieldingly holding each of said saddle parts in its normal position, substantially as described.

604,848. COOKING AND PRESSING APPARATUS. JOSEPHUS F. RUSSELL, Irvington, Va. Filed Dec. 30, 1897. Serial No. 664,613. (No model.)

Claim.—1. In a cooking apparatus the combination of a cylinder; a revoluble spiral or screw extending lengthwise within the cylinder; inlets for steam under pressure and opening into the cylinder; a feed-neck opening into the cylinder at one end; a force-feed screw revoluble in said neck which will keep the neck closed to the escape of steam; and a discharge-opening at the other end of the cylinder that will be kept closed to the escape of steam by engorgement of the escaping cooked material.

2. In a cooking apparatus the combination of a cylinder; a revoluble spiral or screw extending lengthwise within the cylinder; inlets for steam under pressure and opening into the cylinder; a feed-neck opening into the cylinder at one end; a force-feed screw revoluble in said neck which will keep the neck closed to the escape of steam; a tapered compressor-case having its large end joined to a restricted discharge-opening in the cylinder; and a tapered screw revoluble in said case.

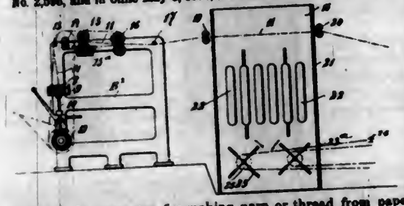


3. In a cooking apparatus the combination of a cooking-cylinder; a revoluble spiral or screw extending lengthwise within the cylinder; inlets for steam under pressure and opening into the cylinder; a feeding-in device at one end of the cylinder which permits continuous feeding of the material to be cooked and at same time prevents back escape of steam; and a discharge-opening at the other end of the cylinder that will be kept closed to the escape of steam by engorgement of the escaping cooked material.

4. The combination of a cooking apparatus having a discharge for the cooked material; a tapered compressor-case having its large end placed to receive the said discharging cooked material and said case having outlets or holes in its wall for the escape of oil and water; a receiver below said case; a pipe through the center of the case and having holes to receive oil and water from the case; and a tapered screw around said pipe, and a pipe connected at one end of the center pipe and leading to the said receiver.

5. In a cooking apparatus the combination of a steam cooking-cylinder; a tapered compressor-case; and a plate, D, having on one side a circular flange, *q*, which fits the end of the steam-cylinder and on the reverse side and lower down another circular flange, *r*, which fits the end of said compressor case and said plate provided with an opening, *c*, which serves as a discharge from the steam-cylinder to the compressor-case.

6. In a cooking apparatus the combination of a cooking-cylinder; a revoluble spiral or screw extending lengthwise within the cylinder; inlets for steam under pressure and opening into the cylinder; a feeding-in device at one end of the cylinder which permits continuous feeding of the material to be cooked and at same time prevents back escape of steam; a discharge-opening at the other end of the cylinder that will be kept closed to the escape of steam by engorgement of the escaping cooked material; a compressor-case having one end joined to the said discharge-opening of the cooking-cylinder and having outlets for the expressed oil and water and a discharge-opening for the dry cooked product; and a compressing-screw in said case.



604,849. PROCESS OF MAKING PAPER THREAD. EMIL CLAVIER, Chemnitz, Germany, assignor to the Kunstweberei Clavier & Company, Leipsic, Germany. Filed Jan. 31, 1896. Serial No. 577,594. (No specimens.)

Claim.—1. The process herein described of making thread from paper, which consists in cutting paper into narrow strips of suitable length, steaming said strips so as to soften the same, twisting the strips into threads, drawing the threads for condensing, rounding and polishing the same, impregnating the threads with a suitable liquid, and finally drying the threads, substantially as set forth.

2. The process herein described of making thread from paper, which consists in cutting paper into narrow strips of suitable length, steaming said strips so as to soften the same, twisting the strips so as to form threads, drawing the threads thus produced and simultaneously subjecting the same to the action of suitable liquids, and finally drying the threads, substantially as set forth.

604,850. APPARATUS FOR MAKING YARN OR THREAD FROM PAPER. EMIL CLAVIER, Chemnitz, Germany, assignor to the Kunstweberei Clavier & Company, Leipsic, Germany. Filed Jan. 31, 1896. Serial No. 577,595. (No model.) Patented in Germany May 4, 1895, No. 86,234; in Austria Dec. 13, 1895, No. 46 1/4,264; in England Dec. 13, 1895, No. 23,942; in Hungary Dec. 30, 1895, No. 5,669; in Belgium Dec. 23, 1895, No. 118,908; in France Jan. 2, 1896, No. 253,949; in Italy Jan. 9, 1896, No. 40,565; in Sweden Jan. 13, 1896, No. 7,263; in Norway Jan. 14, 1896, No. 5,047; in Switzerland Jan. 15, 1896, No. 11,330; in Spain Jan. 18, 1896, No. 18,551; in Portugal Jan. 18, 1896, No. 2,141; in Denmark Jan. 20, 1896, No. 994; in Brazil Apr. 6, 1896, No. 2,042; in India Apr. 6, 1896, No. 126; in Luxemburg Aug. 31, 1896, No. 2,586, and in Chile May 6, 1897, No. 779.

Claim.—In apparatus for making yarn or thread from paper, mechanism for imparting a twist to the shreds of paper, a pair of rolls for pulling the twisted shreds from said mechanism, a pair of drawing-rolls, means for revolving the latter at a greater rate of speed than the pulling-rolls, mechanism for applying suitable size to the twisted shreds between the pulling-rolls and the drawing-rolls, a drying device, and means for conducting the threads from the drawing-rolls through the drying device, substantially as set forth.

604,851. PLOW-CARRIAGE. OLIVER C. HUBBARD, Bedford, Ind. Filed Apr. 6, 1897. Serial No. 630,967. (No model.)

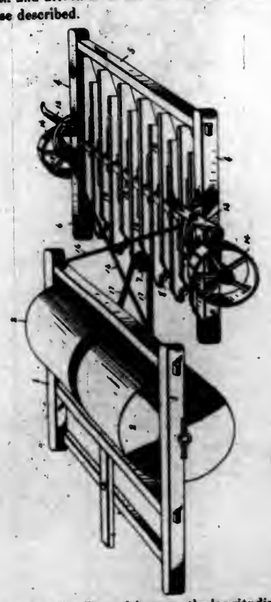
Claim.—1. In combination, a plow-carriage comprising a pole or tongue, and a transverse bar having a loop or arch intermediate of its ends to receive the pole or tongue, to which it is secured, the side or parallel members of the said loop being spaced apart a distance corresponding to the width of the pole to touch the sides thereof and brace it laterally, a plow having its beam pivotally connected to the pole or tongue and adapted to operate and snugly fit within the space of the said loop or arch to be braced laterally thereby, and means mounted upon the pole or tongue and connected with the plow-beam for raising and lowering the front end, substantially as and for the purpose set forth.

2. In a plow-carriage, the combination of a segment-standard, a lever fulcrumed thereto and provided with means to engage with the said standard for holding the lever in an adjusted position, said lever having a sleeve rigidly applied to its lower end, and a wheel-spindle having an arm adjustably mounted in the sleeve of the lever, substantially as and for the purpose set forth.

3. In a plow-carriage, the combination of a wheel-spindle, a support therefor, an arm as 20 having adjustable connection with a part extending laterally from the wheel-spindle, and a guide acting jointly with the said arm 20 to properly position the wheel-spindle, substantially as and for the purpose set forth.

4. In a plow-carriage, the combination of a wheel-spindle having an arm, a support for the said arm, a crank-arm, means for adjustably connecting the crank-arm with the arm of the wheel-spindle, and a guide cooperating with the crank-arm to fix the position or slant of the wheel-spindle, substantially as and for the purpose set forth.

5. In a plow-carriage, the combination of a lever, means for securing the lever in an adjusted position, a wheel-spindle having an offstanding arm, means for adjustably connecting the offstanding arm with the aforesaid lever, a second arm 20 having adjustable connection with the arm of the wheel-spindle, and a guide cooperating with the second arm to hold the wheel-spindle in an adjusted position, substantially as set forth.



6. In a plow-carriage, the combination of a lever having a sleeve and provided with means for securing it in an adjusted position, a crank-arm having a sleeve at its outer end and having its inner end operating in a guide, a wheel-spindle having an arm passing through the aforesaid sleeves and having independent adjustable connection with each, and a keeper for holding the sleeves in fixed relation, substantially as set forth.

7. In a plow-carriage, the combination of a pole or tongue provided with means for raising and lowering the front end of a plow-beam connected therewith, a transverse bar having a loop or arch intermediate of its ends to receive the pole or tongue, to which it is secured, segment-standards at the ends of the transverse bar, levers fulcrumed to the segment-standards and provided with hand-latches to cooperate therewith for holding the levers in an adjusted position, said levers having sleeves at their lower ends, wheel-spindles having arms adjustably secured in the sleeves of the levers, a crank-arm having adjustable connection with the arm of one of the wheel-spindles, and a guide secured to an end portion of the aforesaid transverse bar and receiving the free end of the aforesaid crank-arm, substantially as and for the purpose set forth.

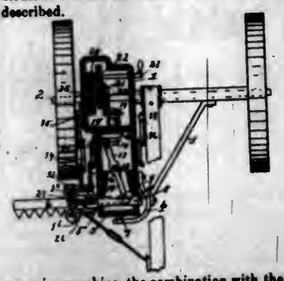
604,852. AUTOMATIC PULVERIZING-HARROW. AARON KINSELL, Cygnet, Ohio, assignor of one-half to Frank M. Lee and Nelson Guyer, same place. Filed May 14, 1897. Serial No. 636,622. (No model.)

Claim.—1. The combination with the roller-frame, of a harrow-

frame connected to said roller-frame to permit it to follow the undulations of the ground independently thereof, a series of longitudinally-arranged blades set on edge with long cutting edges on their lower faces and connected at their forward ends with alternate oppositely-set cranks on a shaft journaled in the harrow-frame, said shaft being connected with and driven from the roller-shaft, substantially as and for the purpose described.

2. In a combined roller and harrow, the longitudinally-arranged parallel blades connected at their forward ends with alternate oppositely-set crank-arms formed on a shaft journaled in said frame, means for guiding the movements of the rear ends of said blades, and means connecting the roller-shaft with said crank-shaft for actuating the latter, substantially as described.

3. The combination with the harrow-frame, of a crank-shaft located at the forward end of said frame and having alternately oppositely disposed crank-arms, means for actuating said shaft connected therewith, a series of parallel longitudinally-arranged blades connected with said crank-arms at their forward ends having slots near their upper edges, a transverse frame-rod passing through the slots in said blades, and spacing-thimbles intermediate said blades, for the purpose and substantially as described.



4. A harrow-frame provided at its forward end with a crank-shaft having the alternate oppositely-set crank-arms, a pulley connected therewith for actuating it, parallel blades connected with the crank-arms of said shaft and having lower longitudinally-arranged cutting edges, means for guiding the movements of the rear ends of the blades, and means for regulating or adjusting the height of the frame for regulating the depth of the cut of the blades, substantially as described.

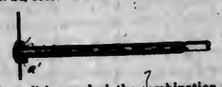
5. A roller-frame in combination with a harrow-frame connected to said harrow-frame by bracing link-rods crossing each other as described and hinged to the roller-frame for permitting the harrow to follow the ground independently of the roller-frame, chopping-blades mounted in said harrow-frame, a crank-shaft for imparting a chopping movement thereto, and a sprocket-wheel and drive-chain connecting the said crank-shaft and roller-shaft, for the purpose and substantially as described.

604,853. MOWING-MACHINE. DANIEL W. KNISELY, Johnsville, Ohio. Filed Nov. 26, 1897. Serial No. 659,702. (No model.)

Claim.—1. In a mowing-machine, the combination with the casing 1, of an inner casing 5 mounted to rotate therein, a tubular case 8 mounted in the outer end of said case 5, the said tubular case 8 having a slot in the portion that is inclosed in the case 5, a link 26 inclosed in the case 8, and having a ball-and-socket connection with the sickle-bar, an arm 11 having a ball-and-socket connection with said link 26, and a rotating beam to impart a reciprocating movement to said arm, all arranged substantially as herein shown and described.

2. In a mowing-machine, the combination with the case 1 mounted on the axle of the machine, and a crank mounted in said case with gearing to drive it, of a case 5 loosely mounted in the outer end of said case 1, a tube or case 8 mounted in the outer end of said case 5 and having an attachment with the shoe of the sickle-bar, an angular link 26 inclosed in said case 8 and having a universal-joint connection with the sickle-bar, a reciprocating arm 11 having a fulcrum in the case 5 and a universal-joint connection with the link 26, a rotating beam 13 having a pivotal connection with said arm 11, means for elevating the sickle-bar while the same is in motion, substantially as shown and described.

3. In a mowing-machine, the combination with the case 1, of an inner case 5 rotatably mounted in the outer end of said case 1, a tubular case 8 loosely mounted in the outer end of said case 5 in a transverse position, the said case 8 having a slot in the portion that is inclosed in said case 5, and arms 8ª adapted to be attached to the shoe of the sickle-bar, a reciprocating arm 11 having a fulcrum on the inner end of the case 5, and ball-and-socket connections between said arm and the sickle-bar, a rotating beam 13 having a flexible connection with said arm 11, a crank having a ball-and-socket connection with said beam, and means for driving said crank, and means for elevating the sickle-bar, substantially as shown and described.



604,854. TOMBSTONE. JOHN B. FOSS, Creighton, Pa. Filed Oct. 30, 1897. Serial No. 656,914. (No model.)

Claim.—1. A hollow porcelain tombstone having an opening in one face, a panel fitting in said opening and having a rib or projection fitting in a recess in the wall of the opening so as to prevent outward movement, and a filling of concrete or cement which contacts with and secures the panel in place.

2. A hollow porcelain tombstone having an opening in one face, a panel fitting in said opening and having a projection fitting in a recess in the wall of the opening to prevent outward movement, the outer face of the panel being flush with the face of the stone, and a filling of concrete or cement which contacts with and secures the panel in place.

604,855. DENTAL DISK-MANDREL. JAMES B. KNEFF, Chicago, Ill. Filed Apr. 24, 1895. Renewed Oct. 11, 1897. Serial No. 654,878. (No model.)

Claim.—1. In a disk-mandrel, the combination of two members between which the disk is adapted to be clamped, one of said members carrying a lug and the other member being provided with oblique walls with one or the other of which said lug engages in locking the disk according as the disk is rotated in one direction or the other, whereby the disk is adapted to be clamped between said members regardless of the direction of rotation of the disk; substantially as described.

2. The combination with a mandrel carrying a mandrel-head, of a clamping-head between which and the mandrel-head the disk is clamped, an opening in said mandrel-head at a distance from the periphery thereof, oblique walls upon the rear of the mandrel-head upon opposite sides of said opening, and a lug or part upon the clamping-head adapted to pass through said opening and to engage one or the other of said oblique walls according as the mandrel is rotated in one direction or the other, the space to the rear of said mandrel-head being completely inclosed; substantially as described.

604,856. BICYCLE-BELL. JEREMIAH KEYES, Providence, R. I., assignor to Simmons & Payne, same place. Filed Oct. 8, 1897. Serial No. 654,577. (No model.)

Claim.—The combination of the pivoted disk, and the bell, with the spiral spring secured at one end to the pivoted disk, and having its opposite end arranged to form the bell-hammer, the friction-wheel, and the revolving wiper adapted to engage with the free end of the spiral spring of the hammer to cause the ringing of the bell, and means for causing the engagement and rotation of the friction-wheel.

REISSUES.

11,663. SPECTACLES. GEORGE RAMSH, Syracuse, N. Y. Filed May 13, 1897. Serial No. 636,333. Original No. 576,251, dated Feb. 2, 1897.

Claim.—1. In a pair of spectacles having temples A A, the bridge B of rigid ductile metal attached to the lenses, the ends of which are extended below the points of attachment, bent inward and upward, and each provided with an inwardly-offset nose-guard C.

2. In a pair of spectacles having temples A, A, the bridge B of rigid ductile metal secured to the lens-frames *b b*, by rigid studs *d d*, and extended below said studs, the said extended ends of the bridge B being bent inward and upward and each provided with an inwardly offset nose-guard C; substantially as described.

3. In a pair of spectacles having temples A A and lens-frames *b b*, the combination therewith of the bridge B of rigid ductile metal soldered or otherwise secured to the posts *d d*, and extended below the posts, the said extended ends being bent inward and upward and the terminals thereof curved and flattened to form offset and adjustable nose-guards, substantially as described.

11,664. IRONING-MACHINE FOR SMOOTHING EDGES OF CUFFS AND COLLARS. FRED R. FAY, Los Angeles, Cal. Filed Aug. 6, 1897. Serial No. 647,371. Original No. 580,810, dated Apr. 13, 1897.

Claim.—1. An ironing-machine comprising a rotatable head formed with a peripheral groove, one wall of the groove being extended beyond the other wall to provide a ledge whereby an article is guided into the groove; substantially as described.

2. An ironing-machine having a rotatable head, a circular groove in the head and a guide on the same plane as a side of the groove, forming a projecting wall to the latter; substantially as set forth.

3. An ironing-machine having a circular rotatable head with circular faces of different circumference, a groove in the circular face of smallest circumference; the surface of the head which extends on a line with the lower wall of the groove forming a guide leading to the groove, substantially as set forth.

4. In a machine of substantially the character described, a rotating portion formed with a groove in which to smooth the edges of articles; the periphery of one wall of which groove is of greater diameter than that of the other wall, whereby a ledge is provided upon which to rest the article and by which to direct it into the groove, substantially as set forth.

5. An ironing-machine having a circular rotatable head with circular faces of different circumference, a groove in the circular face of smallest circumference, a table having a central circular opening, the wall of said opening fitting the face of greatest circumference and in line with the groove therein and means for heating and rotating the head, substantially as set forth.

6. In an ironing-machine, the combination of a rotating circular head formed with a peripheral groove having a guiding-ledge projecting beyond and leading to the groove, said head terminating in an upwardly-presented working end or button with unobstructed working space above it, and means for supporting and operating the head located wholly beneath it; substantially as set forth.

7. The ironing-machine consisting of the table provided with a circular hole, the shaft journaled coaxially with such hole; a circular head fixed on the upper end of the shaft and fitted in the hole and provided with a peripheral groove one wall of which is in line with the face of the table and terminating in a knob at the top with a groove around the neck of the knob; means underneath the table and head for heating the head; and means for rotating the shaft, substantially as set forth.

8. The combination of a vertical rotating shaft; means for rotating the shaft; a circular head on such shaft stepped on its upper face and having around the steps respectively a peripheral groove, substantially as set forth.

9. The combination of a vertical rotating shaft; means for rotating the shaft; a circular head fixed on the top of such shaft and being solid and stepped on its upper face and having around the steps respectively a peripheral groove; and the heating appliance arranged beneath the head to heat it.

10. In an ironing-machine for smoothing the edges of cuffs and collars, a conical revolving head having its surface stepped to form vertical circular walls and horizontal annular ledges, and provided with peripheral grooves formed respectively in the vertical walls, each of which grooves has one of its walls in line with and adjacent to an annular ledge; substantially as shown and for the purposes set forth.

11. In a machine for ironing the edges of collars, a circular rotary head having its upper face stepped and provided with peripheral grooves and terminating at the top in a button or knob having a small neck to approximately fit into the internal angles of the collar, substantially as and for the purpose set forth.

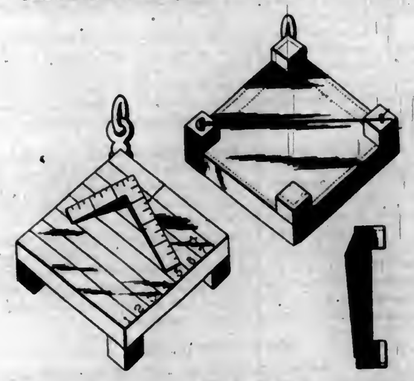
12. The machine for smoothing the edges of cuffs and collars provided with a vertical rotating shaft and a gas-burner arranged near such shaft; and a solid circular head having its upper face stepped and provided with peripheral grooves and in its under side a central socket to fit the upper end of the shaft, and an annular groove to receive the flame from the gas-burner.

11,665. HOLDER FOR NURSERY-BOTTLES. JOSHUA W. STEER, Detroit, Mich. Filed Aug. 9, 1897. Serial No. 647,662. Original No. 580,837, dated Apr. 13, 1897.

Claim.—1. As a new article of manufacture, a bottle-case consisting of an encircling band, the bails depending therefrom, the arms pivoted thereto and extending upward, means for locking the upper ends of said arms about the neck of the bottle when said bottle is supported by said bails, and the hanger pivoted to said encircling band, for the purpose set forth.

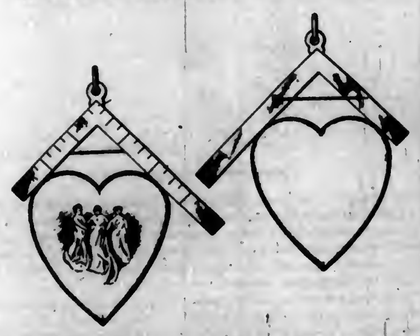
2. In a holder for nursery-bottles, the combination of the bracket 6 composed of the upright portion 6' and the horizontal portion 6", the clamp 8, provided with set-screws to engage with the bedpost and to adjustably support the vertical portion of said bracket, the

sleeve 10 provided with the set-screw 12 adjustably mounted upon the horizontal portion of said bracket, the flexible support 9 having its upper end secured to said adjustable sleeve, from which it is suspended, the bottle-case 1 consisting of the circular band, bails depending therefrom, and arms pivoted thereto and extending upward, means for locking the upper ends of the arms about the neck of the bottle, and a hanger pivoted to the circular band adapted to be secured to the lower end of said flexible support, whereby said bottle is returned to an upright position when released, substantially as described.



DESIGNS.

28,625. BADGE OR SIMILAR ARTICLE. ALFRED C. CLAS, Milwaukee, Wis., assignor to the Milwaukee Carnival Association, same place. Filed Feb. 5, 1898. Serial No. 669,506. Term of patent 3½ years.



Claim.—The design for a badge or similar article, substantially as herein shown and described.

28,626. CHARM. BENJAMIN THOMAS SELMAN, Chattanooga, Tenn. Filed Jan. 26, 1898. Serial No. 667,998. Term of patent 7 years.

Claim.—The design for a charm, substantially as herein shown and described.

28,627. CHARM. BENJAMIN THOMAS SELMAN, Chattanooga, Tenn. Filed Jan. 26, 1898. Serial No. 668,075. Term of patent 7 years.

Claim.—The design for a charm, as herein shown and described.

28,628. COLLAR-BUTTON OR STUD. ACHILL BUFFARE, Newark, N. J. Filed June 26, 1897. Serial No. 642,545. Term of patent 14 years.

Claim.—The design for a collar-button or stud substantially as shown and described.

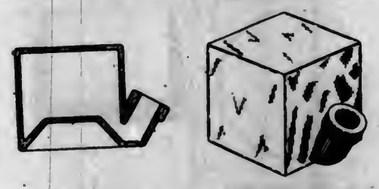
28,629. SPOON. WILLIS O. HART, Unionville, Conn. Filed Apr. 2, 1898. Serial No. 676,251. Term of patent 7 years.

Claim.—The design for a spoon, as herein shown and described.

28,630. SPOON OR FORK HANDLE. JEAN GEO. THEISOLD, North Attleborough, Mass., assignor to the Frank M. Whiting Company, same place. Filed Dec. 30, 1897. Serial No. 664,745. Term of patent 3½ years.

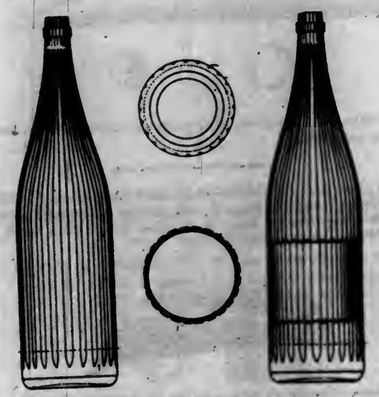
Claim.—The design for a spoon or fork handle as herein shown and described.

28,631. HANDLE FOR SPOONS, FORKS, &c. CHRIS SILBER, Meriden, Conn., assignor to the Rogers & Brother, Waterbury, Conn. Filed Apr. 11, 1898. Serial No. 677,259. Term of patent 7 years.



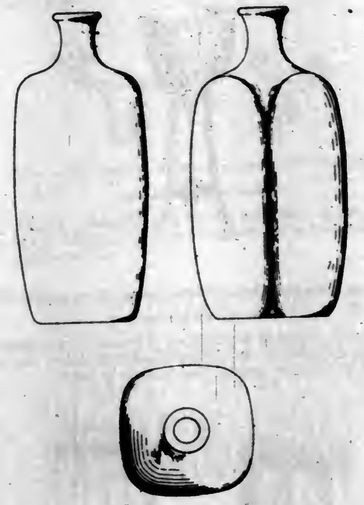
Claim.—A design for a handle for spoons, forks, &c., as herein shown and described.

28,632. BACK FOR BRUSHES OR SIMILAR ARTICLES. GERRAVE C. ROSS, North Attleborough, Mass., assignor to George K. Webster, same place. Filed Mar. 11, 1898. Serial No. 673,540. Term of patent 7 years.



Claim.—The design for the back of a brush, or similar article, substantially as herein shown and described.

28,633. INK-BOTTLE. BROCK CARRUTHERS, Guelph, Canada, assignor of one-half to William Brock Kerr, same place. Filed Mar. 28, 1898. Serial No. 675,502. Term of patent 14 years.

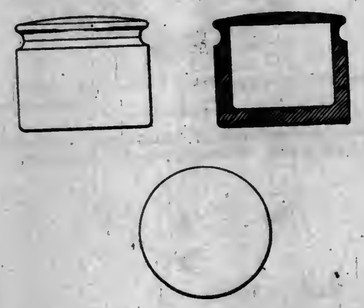


Claim.—The design for an ink-bottle, substantially as herein shown and described.

28,634. BOTTLE. FRANK SCHILLING, Muncie, Ind., assignor to the T. A. Snider Preserve Company, Cincinnati, Ohio. Filed Apr. 9, 1898. Serial No. 677,066. Term of patent 14 years.

Claim.—The design for a bottle substantially as shown and described.

28,635. BOTTLE. EDWARD C. MOORE, Cicero, Ind. Filed Apr. 13, 1898. Serial No. 677,490. Term of patent 14 years.

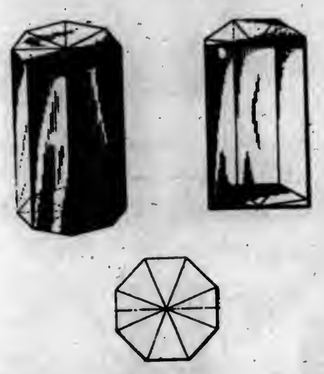


Claim.—The design for a bottle substantially as herein shown and described.

28,636. BOTTLE-CAP. HERMAN TAPPAN, New York, N. Y. Filed Apr. 11, 1898. Serial No. 677,233. Term of patent 7 years.

Claim.—The design for a bottle-cap, as herein shown and described.

28,637. WOODEN JAR. WEBSTER C. ROTH, New York, N. Y. Filed Apr. 12, 1898. Serial No. 677,375. Term of patent 14 years.



Claim.—The design for a wooden jar, substantially as shown and described.

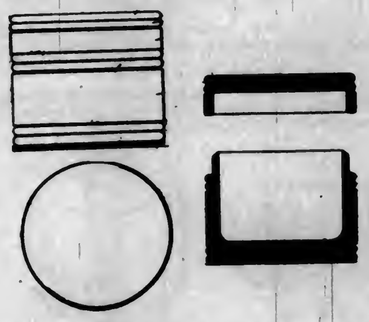
28,638. JARDINIÈRE. WILLIAM M. GREER, New York, N. Y. Filed Apr. 7, 1898. Serial No. 676,829. Term of patent 3½ years.

Claim.—The design for a jardinière as herein shown and described.

28,639. CARTON OR ENVELOP. WILLIAM R. GREE, Syracuse, N. Y., assignor to the Merrell-Soule Company, same place. Filed Dec. 15, 1897. Serial No. 662,062. Term of patent 14 years.

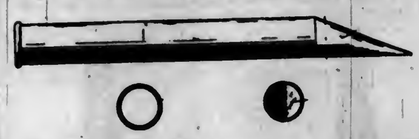
Claim.—The design for a carton or envelop, substantially as herein shown and described.

28,640. PAPER BOX. PHINEAS R. MYERS, New York, N. Y. Filed Feb. 28, 1898. Serial No. 671,300. Term of patent 14 years.



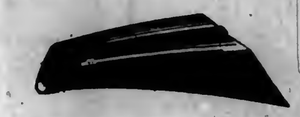
Claim.—The design for a paper box, substantially as herein shown and described.

28,641. BOX. GEORGE H. RICHARDS, Somerville, Mass. Filed July 27, 1897. Serial No. 646,151. Term of patent 14 years.



Claim.—The design for a box substantially as shown and described.

28,642. WOODEN BOX. WILLIAM C. REED, New York, N. Y. Filed Feb. 26, 1898. Serial No. 672,168. Term of patent 14 years.

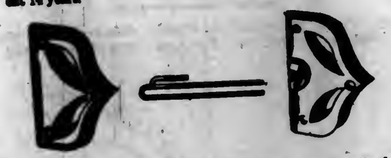


Claim.—The design for a wooden box, substantially as shown and described.

28,643. ATOMIZER-BODY. JAMES A. BURNETT, Indianapolis, Ind. Filed Nov. 6, 1897. Serial No. 657,705. Term of patent 7 years.

Claim.—The design for an atomizer-body substantially as herein shown and described.

28,644. SPOUT FOR TEA-KETTLES OR SIMILAR ARTICLES. GEORGE W. TURNEY, Chicago, Ill., assignor of one-half to the Rome Manufacturing Company, Rome, N. Y. Filed Nov. 2, 1897. Serial No. 657,211. Term of patent 14 years.



Claim.—The design for a spout for tea-kettles and similar articles, as herein shown and described.

28,645. HANDLE FOR POSTAL MARKING AND CANCELING STAMPS. ALBA H. ATKINSON, Indianapolis, Ind., assignor to the Specialty Manufacturing Company, same place. Filed Dec. 3, 1897. Serial No. 660,708. Term of patent 7 years.

Claim.—The design for the handle of a postal marking and canceling stamp, as herein shown and described.

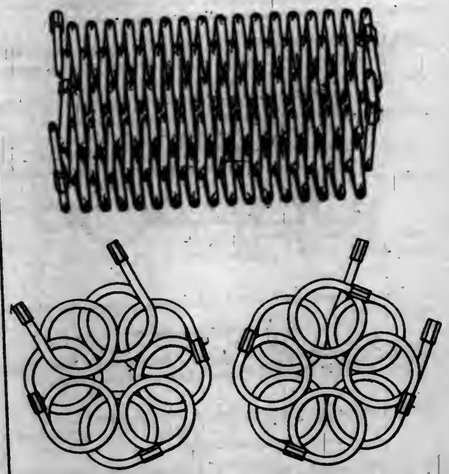
28,646. TROUSERS-FASTENER MEMBER. AUGUST SALOMI, Denton, Tex. Filed Sept. 14, 1897. Serial No. 651,654. Term of patent 14 years.

Claim.—The design for a trousers-fastener member herein shown and described.

28,647. TROUSERS-STRETCHER. JERRY J. LYNCH, Erie, Pa. Filed Apr. 9, 1898. Serial No. 677,094. Term of patent 7 years.

Claim.—The design for a trousers-stretcher substantially as hereinbefore described and illustrated in the accompanying drawing.

28,648. PUSH-BUTTON. MORRIS GOETZ, Hartford, Conn., assignor to the Hart & Hegeman Manufacturing Company, same place. Filed Nov. 30, 1897. Serial No. 660,207. Term of patent 14 years.



Claim.—The design for a push-button herein shown and described.

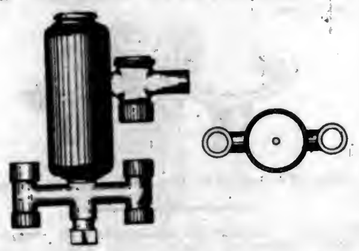
28,649. BURNER. REUBEN UPHAM, New York, N. Y., assignor, by mesne assignments, to the Acetylene House Lighting Company, of West Virginia. Filed Jan. 5, 1898. Serial No. 665,701. Term of patent 14 years.

Claim.—The design for a burner, as herein shown and described.

28,650. COIL-PIPE FOR WATER-HEATERS. REGINE SCHLUMBERGER, Allegheny, Pa. Filed Jan. 18, 1898. Serial No. 667,112. Term of patent 14 years.

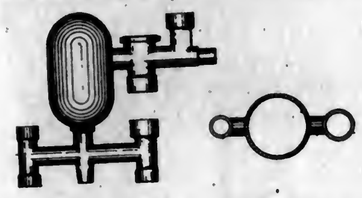
Claim.—The design for coil pipe for water-heaters, as herein shown and described.

28,651. HOLDBACK-IRON FOR THILLS. GEORGE W. FLETCHER, Meadon, Ill. Filed Mar. 14, 1898. Serial No. 673,869. Term of patent 14 years.



Claim.—The design for a holdback-iron for thills herein shown and described.

28,652. BASIN-CLAMP. BENJAMIN DETTELBACH, Cleveland, Ohio. Filed Mar. 12, 1898. Serial No. 673,666. Term of patent 7 years.



Claim.—The design for a basin-clamp, as herein shown and described.

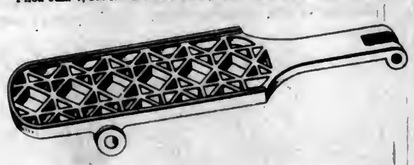
28,658. LUBRICATOR-BODY. DUGALD H. ROBERTS, Detroit, Mich. Filed July 6, 1897. Serial No. 643,660. Term of patent 14 years.

Claim.—The design for a lubricator-body substantially as herein shown and described.

28,654. LUBRICATOR-BODY. DUGALD H. ROBERTS, Detroit, Mich. Filed June 30, 1897. Serial No. 643,030. Term of patent 14 years.

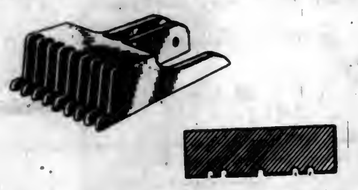
Claim.—The design for a lubricator-body substantially as shown and described.

28,655. SNOW-GUARD. GEORGE F. FOLSOM, Boston, Mass. Filed Mar. 17, 1898. Serial No. 674,263. Term of patent 14 years.



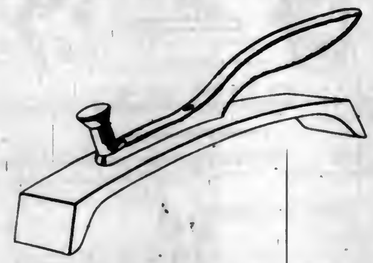
Claim.—The design for a snow-guard, substantially as herein shown and described.

28,656. PIPE-COUPLING MEMBER. WILLIAM CUNNINGHAM SAVAGE, New York, N. Y. Filed Apr. 15, 1897. Serial No. 632,334. Term of patent 14 years.



Claim.—The design for a pipe-coupling member, substantially as shown and described.

28,657. MACHINE-PLATE. NAPOLEON DU BRUL, Cincinnati, Ohio. Filed Jan. 7, 1898. Serial No. 665,984. Term of patent 14 years.

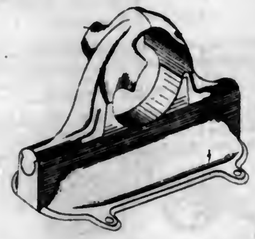


Claim.—The design for a machine-plate substantially as herein shown and described.

28,658. WASHING-MACHINE PLUNGER. SIMEON BROWN and THOMAS P. BROWN, Purity, Ohio. Filed Mar. 9, 1898. Serial No. 673,371. Term of patent 14 years.

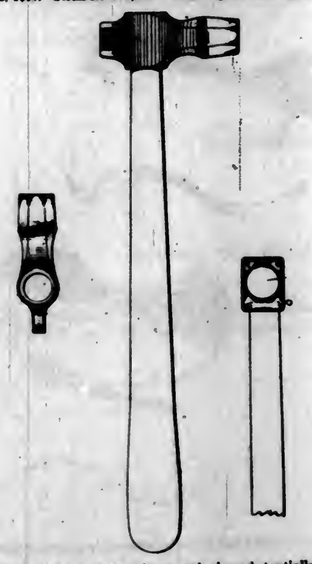
Claim.—The design for a washing-machine plunger, substantially as herein shown and described.

28,659. SHOE-POLISHER FRAME. EDWARD R. LEE, Odin, Ill. Filed Mar. 10, 1898. Serial No. 673,405. Term of patent 7 years.



Claim.—The design for a shoe-polisher frame, as herein shown and described.

28,660. HOPPER FOR SEED-PLANTERS. JAMES A. EVERITT, Indianapolis, Ind. Filed Nov. 6, 1897. Serial No. 657,706. Term of patent 7 years.



Claim.—The design for a seed-planter hopper, substantially as described and shown.

28,661. BICYCLE-LOCK. FREDERICK W. BROWN, Boston, Mass., assignor to Thomas Stanley Paterson, same place. Filed Dec. 18, 1897. Serial No. 662,489. Term of patent 7 years.

Claim.—The design for a bicycle-lock, substantially as shown and described.

28,662. HAMMER-BODY. GEORGE K. YOUNG, Auburn, N. Y. Filed Oct. 11, 1897. Serial No. 654,891. Term of patent 14 years.

Claim.—The design for a hammer-body, substantially as shown and described.

28,663. STOVE OR RANGE. BRADLEY WOODHILL, Dunmore, Pa., assignor to the Scranton Stove Works, Scranton, Pa. Filed Mar. 2, 1898. Serial No. 672,342. Term of patent 14 years.

Claim.—1. In a design for a stove or range, the design for the base; substantially as herein shown and described.

2. In a design for a stove or range, the design for the oven-door; substantially as herein shown and described.

3. In a design for a stove or range, the design for the oven-shelf; substantially as herein shown and described.

4. In a design for a stove, or range, the design for the reservoir; substantially as herein shown and described.

5. In a design for a stove or range, the design for the fire-door; substantially as shown and described.

6. In a design for a stove or range, the design for the panel J, substantially as shown and described.

7. In a design for a stove or range the design for the ash-cup K, substantially as shown and described.

8. In a design for a stove or range, the design for the front draft-door; substantially as herein shown and described.

9. In a design for a stove or range, the design for the broiling-door; substantially as herein shown and described.

10. The design for a cooking stove or range, substantially as herein shown and described.

28,664. STOVE OR RANGE. BRADLEY WOODHILL, Dunmore, Pa., assignor to the Scranton Stove Works, Scranton, Pa. Filed Mar. 2, 1898. Serial No. 672,343. Term of patent 14 years.

Claim.—1. In a design for a stove or range, the design for the base; substantially as herein shown and described.

2. In a design for a stove or range, the design for the oven-door; substantially as herein shown and described.

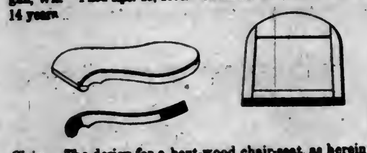
3. In a design for a stove or range, the design for the fire-box door; substantially as herein shown and described.

4. In a design for a stove or range, the design for the panel L; substantially as shown and described.

5. In a design for a stove or range, the design for the ash-pit panel J; substantially as shown and described.

6. In a design for a stove or range, the design for the ash-pit door; substantially as herein shown and described.

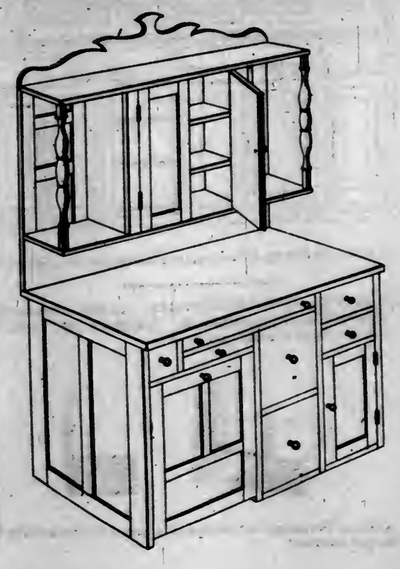
7. In a design for a stove or range, the design for the reservoir; substantially as herein shown and described.



8. In a design for a stove or range, the design for the front ash-pit door; substantially as herein shown and described.

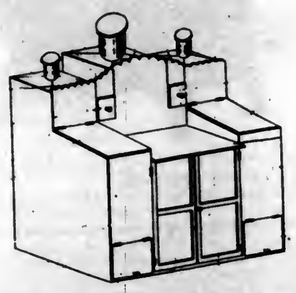
9. In a design for a stove or range, the design for the broiling-door; substantially as herein shown and described.

10. In a design for a stove or range, the design for the corner; substantially as herein shown and described.



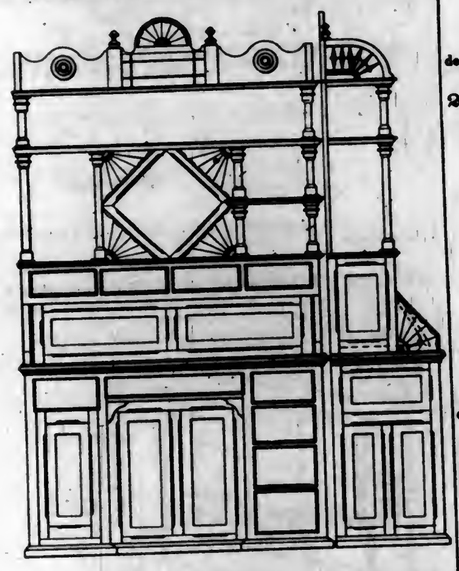
11. The design for a stove or range; substantially as herein shown and described.

28,665. BENT-WOOD CHAIR-SEAT. WILLIAM SCHRADE, Sheboygan, Wis. Filed Apr. 15, 1898. Serial No. 677,747. Term of patent 14 years.



Claim.—The design for a bent-wood chair-seat, as herein shown and described.

28,666. KITCHEN-CABINET. WILLIAM B. TABOR, Alhambra, Ill., assignor of one-half to F. William Brunsworth, same place. Filed Apr. 5, 1898. Serial No. 676,588. Term of patent 7 years.



Claim.—A design for a kitchen-cabinet, substantially as herein shown and described.

28,667. KITCHEN-CABINET. JAMES W. BRADDOCK, Montgomery City, Mo. Filed Mar. 4, 1898. Serial No. 672,605. Term of patent 3½ years.

Claim.—The design for a kitchen cabinet as herein shown and described.

28,668. SECRETARY. ALBERT W. GRUNWALDT, Abrams, Wis. Filed Apr. 12, 1898. Serial No. 677,576. Term of patent 7 years.

Claim.—The design for a secretary as herein described and shown.

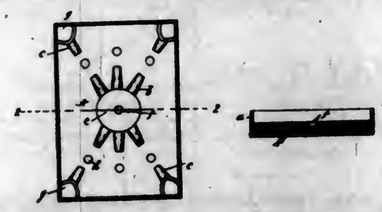
28,669. BASE FOR COIN-SCALES. CHARLES P. SWEENEY and HORATIO WRIGLEY, Philadelphia, Pa. Filed May 1, 1897. Serial No. 634,781. Term of patent 7 years.

Claim.—The design for the base of a coin-scale substantially as shown and described.

28,670. TILE. EVALINDA S. THOMAS, Lindenwold, N. J. Filed Apr. 5, 1898. Serial No. 676,598. Term of patent 14 years.

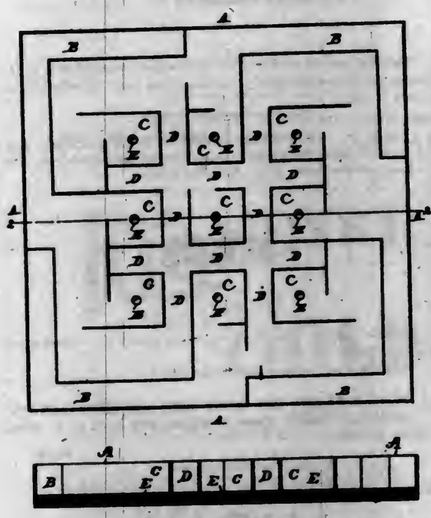
Claim.—The design for tile substantially as herein illustrated and described.

28,671. EMBROIDERY-HOOP. LEWIS GIBBS, Canton, Ohio. Filed Mar. 21, 1898. Serial No. 674,682. Term of patent 14 years.



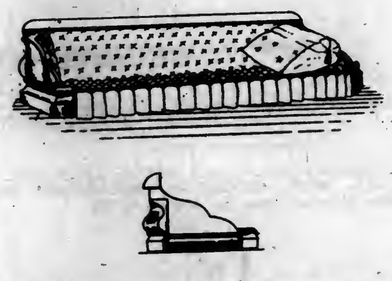
Claim.—The design for an embroidery-hoop as herein shown and described.

28,672. WRAPPED CANDY. OHNIK TAKVORIAN, Boston, Mass. Filed Aug. 14, 1897. Serial No. 648,330. Term of patent 14 years.



Claim.—The design for wrapped candy, substantially as herein shown and described.

28,673. GAME-BOARD. EMILE MINETTO and JOHN MINETTO, New York, N. Y. Filed Mar. 3, 1898. Serial No. 672,309. Term of patent 3½ years.



Claim.—The design for a game-board, substantially as herein shown and described.

28,674. GAME-BOARD. ROBERT W. LINDSAY, Middletown, N. Y. Filed Mar. 12, 1898. Serial No. 673,694. Term of patent 3½ years.

Claim.—The design for a game-board, substantially as herein shown and described.

28,675. BURIAL-CASKET. WILLIAM C. LANTHER, Rochester, N. Y., assignor to the Ideal Couch and Casket Company, same place. Filed Feb. 27, 1897. Serial No. 626,653. Term of patent 14 years.

Claim.—The design for a burial-casket, as herein shown and described.

28,676. FABRIC. HOWARD M. BETTS, New York, N. Y., assignor to A. A. Vantine & Co., same place. Filed Feb. 21, 1898. Serial No. 671,214. Term of patent 3½ years.

Claim.—The design for fabric substantially as herein shown and described.

TRADE-MARKS

REGISTERED MAY 17, 1898.

81,545. BOOKS, PAMPHLETS, AND LEAFLETS. DAVID PATTERSON HATCH, Los Angeles, Cal. Filed Feb. 28, 1898.

Essential feature.—A square or rectangular figure having diagonal lines across it and a circle at the center where the diagonal lines bisect each other. Used since January 15, 1898.

81,546. COMBS. ROBERT FRED TOOTHEMAKER, London, England, New York, N. Y., and Washington, D. C. Filed Mar. 31, 1898.

SHELLENE

Essential feature.—The word "SHELLENE." Used since February 1, 1898.

81,547. RIBBONS. ERNEST & HERMAN LEVY, New York, N. Y. Filed Feb. 25, 1898.

GILT
EDGE

Essential feature.—The words "GILT EDGE." Used since January 2, 1898.

81,548. GLOVES. BENJAMIN ALTHAN, New York, N. Y. Filed Mar. 22, 1898.

THE MARVEX.

Essential feature.—The words "THE MARVEX." Used since February 1, 1898.

81,549. HOSIERY. MISSOULA MERCANTILE COMPANY, Missoula, Mont. Filed Mar. 2, 1898.

Essential feature.—The words "NEVER DARN" and the representation of a needle extending through the letters. Used since December 1, 1897.

81,550. FIBROUS MATERIAL FOR STUFFING PURPOSES. WEST INDIA FIBRE COMPANY, Salem and Boston, Mass. Filed Jan. 26, 1898.

Essential feature.—A ring of two twisted ropes, within which appears the representation of a cocoanut-palm tree. Used since November 1, 1897.

81,551. ANTIFOULING PAINT FOR SHIPS' BOTTOMS. HOLZAPFEL'S COMPOSITIONS COMPANY, LIMITED, Newcastle-upon-Tyne, England, and New York, N. Y. Filed May 4, 1897.

INTERNATIONAL

Essential feature.—The word "INTERNATIONAL." Used since January 1, 1897.

81,552. REMEDY FOR INSECT BITES AND STINGS AND FOR VEGETABLE POISON. JAMES L. MILLER, New York, N. Y. Filed Mar. 12, 1898.

HIRAX

Essential feature.—The word "HIRAX." Used since October, 1893.

81,553. COMPOUND FOR THE CURE OF DYSPEPSIA. BASIL HILL, Pittsburg, Pa. Filed Feb. 23, 1898.

B. H.

Essential feature.—The letters "B. H." Used since May, 1877.

81,554. PREPARATION OF MUSTARD AND HORSE-RADISH. DODSON-BRAUD MANUFACTURING COMPANY, St. Louis, Mo. Filed Feb. 5, 1898.

81,554 

Essential feature.—The words "MUSTARD WITH HORSE-RADISH" and the pictorial representation of a horse-radish, said pictorial representation being inclined downwardly from right to left and the compound word "Horse-Radish" inclining upwardly across said representation from left to right. Used since June, 1897.

81,555. CEREAL FOOD PRODUCTS. THE H-O (HORNBY'S OATMEAL) COMPANY, New York, N. Y. Filed Jan. 19, 1898.

WARRIOR

Essential feature.—The word "WARRIOR." Used since December 20, 1897.

81,556. WHEAT-FLOUR. W. H. KNEISBACK & Co., Hopkinton, Minn. Filed Apr. 1, 1898.

KLONDYKE GOLD

Essential feature.—The words "KLONDIKE GOLD." Used since March 11, 1898.

81,557. WHEAT-FLOUR. HOBLENVILLE MILLING COMPANY, Hoblenville, Ind. Filed Mar. 23, 1898.

KISMET.

Essential feature.—The word "KISMET." Used since March 1, 1898.

81,558. BLENDED COFFEE CONTAINING JAVA AND MOCHA. R. T. SMITH COMPANY, Worcester, Mass. Filed Feb. 16, 1898.

CONSTITUTION

Essential feature.—The word "CONSTITUTION." Used since December, 1897.

81,559. WHISKY. BERNARD & Co., Leith, Scotland. Filed Feb. 18, 1898.

ENCORE

Essential feature.—The word "ENCORE" and the signature "BERNARD & Co." Used since 1887.

81,560. WHISKY. DANIEL CRAWFORD & SON, LIMITED, Glasgow, Scotland. Filed Mar. 17, 1898.

Daniel Crawford

Essential feature.—The signature "DANIEL CRAWFORD." Used since 1876.

81,561. WHISKY. ROBERT CRAWFORD & Co., Edinburgh and Leith, Scotland. Filed Feb. 18, 1898.

Essential feature.—Three diamond devices joined together containing the letter "C." Used since 1896.

81,562. WOODEN SKEWERS. WALTER SCOTT SHIPP, Toronto, Canada. Filed Dec. 30, 1897.

Essential feature.—A representation of the letter "O." Used since May 1, 1897.

81,563. TIN AND TERNE PLATES. C. S. MERRICK & Co., New Haven, Conn. Filed Feb. 7, 1898.

YALE

Essential feature.—The word "YALE." Used since March 1, 1893.

81,564. COPPER IN INGOTS, BARS, AND OTHER UNMANUFACTURED FORMS. THE MOUNTAIN COPPER COMPANY, LIMITED, London, England. Filed Mar. 16, 1898.

MOCOCO

Essential feature.—The word "MOCOCO." Used since March 8, 1898.

81,565. SUPERCARBURETED STEEL ARTICLES MADE UNDER REGISTRANT'S PROCESS. HARVEY STEEL COMPANY, Newark, N. J., and New York, N. Y. Filed Oct. 23, 1897.

Harveyed

Essential feature.—The word "HARVEYED." Used since March, 1890.

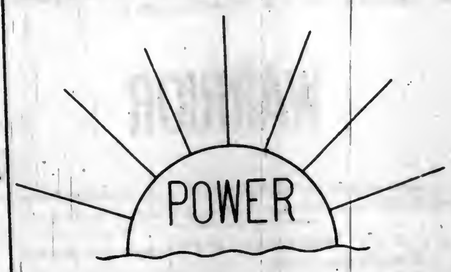
81,566. STEEL SHOVELS, SPADES, AND SCOOPS. THE AVERY STAMPING COMPANY, Cleveland, Ohio. Filed Mar. 7, 1898.

NATIONAL

Essential feature.—The word "NATIONAL." Used since September, 1897.

81,567. VEHICLE-SPRINGS. DEERE & WEBBER COMPANY, Minneapolis, Minn. Filed Mar. 21, 1898.

JACORD.



Essential feature.—The word "JACORD." Used since December 1, 1897.

81,568. BICYCLE-CHAINS. BALDWIN CYCLE CHAIN COMPANY, Worcester, Mass. Filed Aug. 16, 1897.

Essential feature.—The letter "B" inclosed in a geometrical figure having polygonal sides and surrounded by a border representing an endless bicycle-chain. Used since June 1, 1897.

81,569. ENGINES. POWER SPECIALTY CO., New York, N. Y. Filed Feb. 15, 1898.

Essential feature.—A curved line on the arc of a circle, lines extending radially from the convex side of said curved line, and a waved line extending between and across the ends of said curved line. Used since October 1, 1895.

PHOTO-LITH. THE NORRIS PETERS CO. WASHINGTON, D.C.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

BOYDEN POWER BRAKE COMPANY *et al. v.* WESTINGHOUSE *et al.* WESTINGHOUSE *et al. v.* BOYDEN POWER BRAKE COMPANY *et al.*

Decided May 9, 1898.

1. WESTINGHOUSE, JR.—BRAKE MECHANISM—NOT INFRINGED.
   Claims 1, 2, and 4 of Letters Patent No. 360,070, granted March 29, 1887, to George Westinghouse, Jr., for a fluid-pressure automatic-brake mechanism, construed and *Held* not infringed.
2. SAME—CONSTRUCTION OF CLAIM 2—FUNCTION OF MACHINE.
   Claim 2 of Letters Patent No. 360,070, which reads "in a brake mechanism, the combination of a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple valve having a piston, whose preliminary traverse admits air from the auxiliary reservoir to the brake-cylinder, and which by a further traverse admits air directly from the main air-pipe to the brake-cylinder, substantially as set forth," is, to a certain extent, for a function—viz., the admission of air directly from the train-pipe to the brake-cylinder—and is only limited to such function when performed by the further traverse of the piston of the triple valve. If it be not susceptible of the interpretation that it is simply for a function, then the performance of that function must be limited to the particular means described in the specification for the admission of air from the train-pipe to the brake-cylinder.
3. SAME—SAME—SAME.
   If this claim be interpreted simply as a claim for the function of admitting air to the brake-cylinder directly from the train-pipe, it is open to the objection that the mere function of a machine cannot be patented. (Citing *Corning* v. *Burden*, 15 How., 252; *Risdon Locomotive Works* v. *Medart*, 71 O. G., 751; 158 U. S., 68, and other cases.)
4. SAME—SAME—"SUBSTANTIALLY AS SET FORTH."
   The words "substantially as set forth" have been uniformly held by the Supreme Court to import into a claim the particulars of the specification. A claim, therefore, which might otherwise be bad, as covering a function or result, when containing these words should be construed in connection with the specification, and when so construed may be held to be valid. (Citing *Seymour* v. *Osborne*, 11 Wall., 516, and *The Corn Planter Patent*, 23 Wall., 181.)
5. PROCESS—PATENTABILITY—CHEMICAL ACTION.
   Risdon Locomotive Works v. *Medart* and other cases assume, although they do not expressly decide, that a process to be patentable must involve a chemical or other similar elemental action, and it may be still regarded as an open question whether the patentability of processes extends beyond this class of inventions.
6. SAME—SAME—FUNCTION OF MACHINE.
   Where a process is simply the function or operative effect of a machine, *Corning* v. *Burden*, *Risdon Locomotive Works* v. *Medart*, and other cases are conclusive against its patentability; but where it is one which, though ordinarily and most successfully performed by machinery, may also be performed by simple manipulation—such, for instance, as the folding of a paper in a peculiar way for the manufacture of paper bags or a new method of weaving a hammock—there are cases to the effect that such a process is patentable, though none of the powers of nature be invoked to aid in producing the result. (*Eastern Paper Bag Co* v. *Standard Paper Bag Co.*, 41 O. G., 231; 30 Fed. Rep., 63; *Union Paper Bag Machine Co.* v. *Waterbury*, 39 Ib., 389; *Travers* v. *Am. Cordage Co.*, 70 O. G., 277; 61 Fed. Rep., 771.)
7. INFRINGEMENT—DEFENDANT WITHIN THE LETTER OF THE CLAIMS OF COMPLAINANT.
   If it be conceded that Boyden's device corresponds with the letter of Westinghouse's claims 1 and 4, that does not settle conclusively the question of infringement. A charge of infringement is sometimes made out, though the letter of the claims be avoided. The converse is equally true. The patentee may bring the defendant within the letter of his claims, but if the latter has so far changed the principle of the device that the claims of the patent, literally construed, have ceased to represent his actual invention he is as little subject to be adjudged an infringer as one who has violated the letter of a statute is to be convicted when he has done nothing in conflict with its spirit and intent.
8. SAME—PIONEER INVENTION—FUNCTION OF MACHINE.
   If the patent for a machine be a pioneer, the alleged infringer must have done something more than reach the same result. He must have reached it by substantially the same or similar means, or the rule that the function of a machine cannot be patented is of no particular value. To say that the patentee of a pioneer invention for a new mechanism is entitled to every mechanical device which produces the same result is to hold that he is entitled to patent his function. Mere variations of form may be disregarded, but the substance of the invention must be there.
9. INVENTION—"PIONEER" INVENTION DEFINED.
   The word "pioneer" is commonly understood to denote a patent covering a function never before performed, a wholly novel device, or one of such novelty and importance as to mark a distinct step in the progress of the art, as distinguished from a mere improvement or perfection of what had gone before.
10. INFRINGEMENT—FUNCTIONAL INVENTION—DIFFERENCE IN FORM ONLY.
    The ruling of the Supreme Court that where the invention is functional and the defendant's device differs from that of the patentee only in form or in rearrangement of the same elements of a combination he would be adjudged an infringer, even if in certain particulars his device be an improvement upon that of the patentee, is in no way qualified.
11. DISSENTING OPINION.
    Mr. Justice Shiras, Mr. Justice Brewer, Mr. Justice Gray, and Mr. Justice McKenna dissented from the opinion and from the decision of the Court.

ON writ of *certiorari* to the Circuit Court of Appeals for the Fourth Circuit.

STATEMENT OF THE CASE.

This was a writ of *certiorari* to review a decree of the Circuit Court of Appeals, reversing a decree of the Circuit Court for the District of Maryland, which had sustained, in part, a bill filed by Westinghouse against the Boyden Power Brake Company for the infringement of Patent No. 360,070, and from which decree both parties had taken an appeal to the Circuit Court of Appeals.

The patent in suit, which was issued March 29, 1887, to George Westinghouse, Jr., is for a fluid-pressure automatic-brake mechanism, the object of which is said in the specification to be—

to enable the application of brake-shoes to car-wheels by fluid-pressure to be effected with greater rapidity and effectiveness than heretofore, more particularly in trains of considerable length, as well as to economize compressed air in the operation of braking by utilizing in the brake-cylinders the greater portion of the volume of air which in former practice was directly discharged into the atmosphere.

To this end my invention, generally stated, consists in a novel combination of a brake-pipe, an auxiliary reservoir, a brake-cylinder, and a "triple-valve" device governing, primarily, communication between the auxiliary reservoir and the brake-cylinder, and, secondarily, communication directly from the brake-pipe to the brake-cylinder.

There follows here a description of the Westinghouse automatic brake as theretofore used, its mode of operation, and the defects or insufficiencies which attended its application to long trains, in the following language:

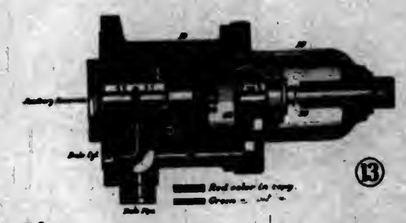
In the application of the Westinghouse automatic brake as heretofore and at present commonly in use, each car is provided with a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple valve, the triple valve having three connections—to wit, one to the main air-brake pipe, one to the auxiliary reservoir, and one to the brake-cylinder. The main air-pipe has a stop-cock at or near each of its ends, to be opened or closed as required, and is fitted with flexible connections and couplings for connecting the pipes from car to car of a train, so as to form a continuous line for the transmission of compressed air from a main reservoir supplied by an air-pump on the engine. When the brakes are off or released, but in readiness for action upon the wheels of the train, the air which fills the main reservoir and main air-pipes has a pressure of from sixty-five to seventy-five pounds to the square inch, and by reason of the connections referred to the same pressure is exerted in the casings of the triple valves on both sides of their pistons and in the auxiliary reservoirs connected therewith. At the same time passages called "release-ports" are open from the brake-cylinders to the atmosphere. When it is desired to apply the brakes, air is allowed to escape from the main air-pipes through the engineer's valve, thereby reducing the pressure in the main air-pipes, whereupon the then higher pressure in the auxiliary reservoirs moves the pistons of the triple valves, so as to first close the passages from the triple valves to the brake-pipe and at the same time close the release-ports of all the brake-cylinders, and then open the passages from the auxiliary reservoirs to the brake-cylinders, the pistons of which are forced out by the compressed air thereby admitted to the brake-cylinders, applying the brakes by means of suitable levers and connections, all of which mechanism is fully shown in various Letters Patent granted to me.

The application of the brakes with their full force has heretofore required a discharge of air from the main pipe sufficient to reduce the pressure in said pipe below that remaining in the auxiliary reservoir after the brakes have been fully applied, and it has been found that, while the brakes are sufficiently quick in action on comparatively short trains, their action on long trains of from thirty to fifty cars, which are common in freight service under present practice, is in a measure slow, particularly by reason of the fact that all the air required to be discharged from the main pipe to set the brakes must travel from the rear of the train to a single discharge-opening on the engine. This discharge of air at the engine has not only involved a serious loss of time in braking, but also a waste of air. Under my present invention a quicker and more efficient action of the brakes is obtained, and air which has been heretofore wasted in the application of the brakes is almost wholly utilized to act upon the brake-pistons.

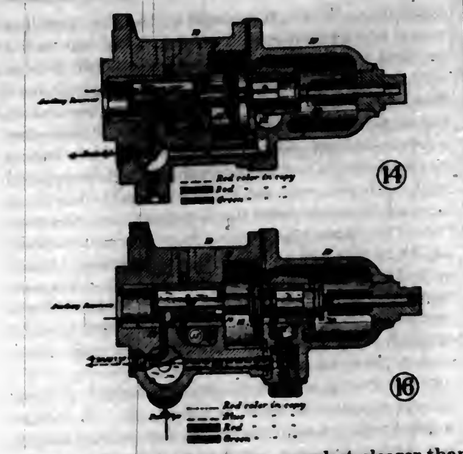
After a detailed description of the invention, an important feature of which is a triple valve, (hereinafter more fully explained in the opinion,) with references to the accompanying drawings, the specification proceeds to state that—

so far as the performance of its preliminary function in ordinary braking is concerned—that is to say, effecting the closure of communication between the main air-pipe and the auxiliary reservoir, and the opening of communication between the auxiliary reservoir and the brake-cylinder in applying the brakes, and the reverse operations in releasing the brakes—the triple valve 10 accords substantially with that set forth in Letters Patent of the United States No. 220,556, granted and issued to me October 14, 1879, and is not, therefore, saving as to the structural features by which it performs the further function of effecting the direct admission of air from the main air-pipe to the brake-cylinder, as presently to be described, claimed as of my present invention. Certain of its elements devised and employed by me prior thereto will, however, be herein specified, in order to render its construction and operative relation to other members of the brake mechanism fully intelligible.

After a further reference to the drawings he again states that—



so far as hereinbefore described, the triple valve accords in all substantial particulars with and is adapted to operate similarly to those of my Letters Patent Nos. 168,359, 172,064, and 220,556, and, in order that it may perform the further functions requisite in the practice of my present invention, it is provided with certain additional members, which will now be described.



These additional members, which are said to be for the purpose of effecting the admission of air directly from the main air-pipe to the brake-cylinder when it is desired to apply the brakes with great rapidity and full force, consist of (1) a passage-way through which air can be admitted directly from the main air (or train) pipe to the brake-cylinder, without passing through the auxiliary reservoir; and (2) an auxiliary valve in connection with such passage, that, when the triple-valve piston makes a short or preliminary movement, the passage-way direct from the train-pipe to brake-cylinder, controlled by said valve, will not be opened, while, in the event of a long or full movement of the piston, or "further traverse," as it is called, such direct passage-way will be thrown wide open to the admission of train-pipe air, and the brake-cylinder will be rapidly filled thereby.

After describing the auxiliary sliding valve 41 and its connections, as well as the operation of the device in ordinary (non-emergency) cases of checking the speed of or stopping trains, already fully provided for in previous patents, he proceeds to state its operation in cases of emergency which the patent was specially designed to cover, as follows:

In the event, however, of its becoming necessary to apply the brakes with great rapidity and with their greatest available force, the engineer, by means of the valve at his command, instantly discharges sufficient air from the front end of the main air-pipe to effect a sudden reduction of pressure of about twenty pounds per square inch therein, whereupon the piston 12 of the triple valve is forced to the extreme limit of its stroke in the direction of the drain-cup 19, carrying with it the stem 36 and auxiliary slide-valve 41, which instantly uncovers the port 42 and discharges air from the main air-pipe through the opening of the check-valve 49 and the passages 46 and 48 to the brake-cylinder, and, each car being provided with one of these devices, it will be seen that they are successively moved with great rapidity, there being practically on a train of fifty cars fifty openings for discharging compressed air from the main pipe, instead of the single opening heretofore commonly used. Not only is there a passage of considerable size opened from the brake-pipe on each car, whereby the pressure is more quickly reduced, but the air so discharged is utilized in the performance of preliminary work, it being found in practice that the air so taken from the pipe will exert a pressure of about twenty-five pounds in the brake-cylinders. When the piston 12 arrives at the extremity of its stroke, as above specified, the supplemental port 35 of the slide-valve 14 is brought into communication with the port 33 and passages 22 and 16, which serves to discharge the reservoir-pressure into the brake-cylinder, thereby augmenting the pressure already exerted in the brake-cylinder by the air admitted from the main air-pipe. Upon the reduction of the pressure in the main air-pipe below that in the brake-cylinders, as by the breaking in two of the train, the check-valve 49 closes communication between the passages 46 and 18, thereby preventing the return of the air from the brake-cylinder to the main air-pipe. The feed-opening for the admission of air from the auxiliary reservoir to the brake-cylinder is purposely made of comparatively small diameter, it having been determined by experiment that the initial application of the brakes should not be made with maximum force, and this opening may be made of such size as to apply the brakes exactly in accord with the requirements of the most efficient work.

In using the terms "triple valve" and "triple-valve device" I refer to a valve device, however specifically constructed, having a connection with the main air or brake pipe, another with an auxiliary reservoir or chamber for the storage of power, and another with a brake-cylinder or its equivalent for the utilization of the stored power and with a release or discharge passage for releasing the operative power from the brake-cylinder, whether the valves governing these passages or connections are arranged in one or more cases and are moved by a piston or its equivalent or by a series of pistons or their equivalents, there being numerous examples in the art of constructions varying materially in appearance whereby these functions are performed, both in plenum and vacuum brake mechanisms.

The above drawings are somewhat clearer than those annexed to the patent, and exhibit the triple valve and its connections in three positions, viz., No. 13, Released or "Brakes Off;" No. 14, Ordinary Service Application, and No. 16, "Quick Action" Position.

The only claims of the patent alleged to have been infringed are the first, second and fourth, which read as follows:

1. In a brake mechanism, the combination of a main air-pipe, an auxiliary reservoir, a brake-cylinder, a triple valve, and an auxiliary-valve device, actuated by the piston of the triple valve and independent of the main valve thereof, for admitting air in the application of the brake directly from the main air-pipe to the brake-cylinder, substantially as set forth.

2. In a brake mechanism, the combination of a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple valve having a piston whose preliminary traverse admits air from the auxiliary reservoir to the brake-cylinder, and which by a further traverse admits air directly from the main air-pipe to the brake-cylinder, substantially as set forth.

4. The combination, in a triple-valve device, of a case or chest, a piston fixed upon a stem and working in a chamber therein, a valve moving with the piston-stem and governing ports and passages in the case leading to connections with an auxiliary reservoir and a brake-cylinder and to the atmosphere, respectively, and an auxiliary valve actuated by the piston-stem and controlling communication between passages leading to connections with a main air-pipe and with the brake-cylinder, respectively, substantially as set forth.

The joint and several answer of the Boyden Brake Company and the individual defendants admitted that such company was engaged in manufacturing and selling a fluid-pressure brake, but denied that the same was an infringement upon complainants' patent, and also denied that Westinghouse was the original inventor of the mechanism covered by the patent, and alleged that an apparatus, substantially identical in character, had been previously granted Westinghouse, March 5, 1872, (No. 124,404,) and that a like apparatus was previously described in the following patents issued to Westinghouse, viz: No. 138,827, May 13, 1873; No. 144,006, October 28, 1873; No. 168,359, October 5, 1875; No. 172,064, January 11, 1876; No. 220,556, October 14, 1879, and also in three patents to other parties, not necessary here to be specifically mentioned.

The answer further denied any infringement of the first, fourth and fifth claims of the patent sued upon, (No. 360,070,) and, with respect to the second claim, averred the same to be invalid because the combination of parts therein named is inoperative to perform and incapable of performing the function set forth in said claim; and that, if the said claim be considered merely as the combination of parts therein set forth, and without reference to the function described as performed by it, it is invalid for the reason that the same combination of parts is shown in most of the prior patents above cited, and has been publicly used by the complainants for a long time prior to the date of the said Letters Patent No. 360,070.

The answer further averred the claim to be uncertain and ambiguous, and if the functions recited by it are construed as amplifying the description of the combination to distinguish this combination from that shown in the prior patents—

then the defendants say that the said claim is anticipated by the prior Letters Patent issued to George A. Boyden on June 20, 1882, for the reason that air-brake valves made in accordance with the last-mentioned patent embody the same combination of parts, and will perform the same functions, and operate in substantially the same manner as stated in said second claim.

Upon a hearing in the circuit court upon the pleadings and proofs, that court was of opinion that the second claim was valid, and had been infringed, but that defendants had not infringed claims 1 and 4, and as to those the bill was dismissed. (66 Fed. Rep., 997.) From the decree entered in pursuance of this opinion both parties appealed to the Court of Appeals for the Fourth Circuit, which affirmed the action of the circuit court with respect to the first and fourth claims, but reversed it with respect to the second claim, and dismissed the bill. (25 U. S. App., 475.) Whereupon complainants applied for and were granted a writ of *certiorari*.

Full copies of the principal Westinghouse patents are printed in *Westinghouse Brake Co.* v. *N. Y. Brake Co.*, (26 U. S. App., 248,) and of the Boyden patents in the report of this case in 25 U. S. App., 475.

Mr. George H. Christy, *Mr. Frederic H. Betts*, *Messrs. Bernard Carter & Sons*, and *Mr. J. Snowden Bell* for Westinghouse *et al.*

Mr. Justice BROWN delivered the opinion of the Court.

The history of arresting the speed of railway-trains by the application of compressed air is one, to which the records of the Patent Office bear frequent witness, of a gradual progress from rude and imperfect beginnings, step by step, to a final consummation, which, in respect to this invention, had not been reached when the patent in suit was taken out, and which, it is quite possible, has not been reached to this day. It is not disputed that the most important steps in this direction have been taken by Westinghouse himself.

The original substitution of the air-brake for the old hand-brake was itself almost a revolution, but the main difficulty seems to have arisen in the subsequent extension of that system to long trains of freight-cars, in securing a simultaneous application of brakes to each of perhaps forty or fifty cars in such a train, and finally in bringing about the instantaneous as well as simultaneous application of such brakes in cases of emergency, when the speediest possible stoppage of the train is desired to avoid a catastrophe.

Patent No. 88,929, issued April 13, 1869, appears to have been the earliest of the Westinghouse series. This brake, known as the *straight air-brake*, consisted of an air-compressing pump, operated by steam from the locomotive-boiler, by which air was compressed into a reservoir, located under the lo-

comotive, to a pressure of about eighty pounds to the square inch. This reservoir, being still in use, is now known as the main reservoir. From this reservoir an air-pipe, usually called the train-pipe, led into the cab, where the supply of air was regulated by an "engineer's valve," thence down and back under the tender and cars, being united between the cars by a flexible hose with metal couplings, rendering the train-pipe continuous. These couplings were automatically detachable; that is, while they kept their grip upon each other under the ordinary strains incident to the running of the train, they would readily pull apart under unusual strains, as when the car-coupling broke and the train pulled in two.

From the train-pipe of each car, a branch pipe connected with the forward end of a cylinder, called the "brake-cylinder," which contained a piston, the stem of which was connected with the brake-levers of the car. This piston was moved and the brakes applied, by means of compressed air admitted through the train-pipe and its branches, into the forward end of the brake-cylinder. When the brakes were to be applied, the engineer opened his valve, admitted the compressed air into the train-pipes and brake-cylinders, whereby the levers were operated and the brakes applied. To release the brakes, he reversed the valve, whereby the compressed air escaped from the brake-cylinders, flowed forward along the train-pipe to the escape-port of the engineer's valve, thence into the atmosphere. Upon the release of the compressed air, the pistons of the brake-cylinders were forced forward again by means of springs, and the brake-shoes removed from the wheels. By means of this apparatus, the train might be wholly stopped or slowed down by a full or partial application of the brakes. As between a full stop and a partial stop, or slow speed, there was only a question of the amount of air to be released from the main reservoir. The validity of this patent was sustained by the Circuit Court for the Northern District of Ohio, Mr. Justice Swayne and Judge Welker sitting, in *Westinghouse* v. *The Air Brake Company*, (9 O. G., 538.) The court said, in its opinion, that while Westinghouse was not the first to conceive the idea of operating railway-brakes by air-pressure, such fact did not detract at all from his merits or rights as a successful inventor; that the new elements introduced by him—

fully substantiated his pretensions as an original and meritorious inventor, and entitled him as such to the amplest protection of the law,

and that it appeared from the record and briefs that he was the first to put an air-brake into successful actual use.

While the application of this brake to short trains was reasonably successful, the time required for the air to pass from the locomotive to the rear cars of a long train (about one second per car) rendered it impossible to stop the train with the requisite celerity, since in a train of ten cars it would be ten seconds before the brakes could be applied to the rear car, and to a freight-train of fifty cars nearly a minute. While the speed of the foremost car would be checked at once, those in the rear would proceed at unabated speed, and in their sudden contact with the forward cars would produce such shocks as to often cause damage. As a train moving at the rate of fifty miles an hour makes over seventy feet per second, a train of fifty cars would run half a mile before the brakes could be applied to the rear car. So, too, if the rear end of the train became detached from the forward end by the rupture of the train-pipe or couplings, the brakes could not be applied at all, since the compressed air admitted to the train-pipe by opening the engineer's valve would escape into the atmosphere without operating the brakes, or if the brakes were already applied, they would be instantly released when such rupture occurred.

The first step taken toward the removal of these defects resulted in what is known as "the *automatic brake*," described first in Patent No. 124,404 in a crude form, and, after several improvements, finally culminating in Patent No. 220,556 of 1880. The salient features of this brake were an auxiliary reservoir beneath each car for the reception and storage of compressed air from the main reservoir, and a triple valve, so called, automatically controlling the flow of compressed air in three directions, by opening and closing, at the proper times, three ports or valve-openings, viz: first, a port or valve known as the "feeding-in valve" from the train-pipe to the auxiliary reservoir, allowing the auxiliary reservoir to fill so as to be ready when the brakes were applied; second, a port or valve from the auxiliary reservoir to the brake-cylinder, which allowed a flow of compressed air to apply the brakes, and was called the "main valve;" third, a port or valve from the brake-cylinder to the open air, denominated the "release-valve," to be opened when it was desired to release the brakes.

The operation of these valves was as follows: Before the train starts, compressed air from the main reservoir is permitted to flow back through the train-pipe, and through valve No. 1, for the purpose of charging the auxiliary reservoir beneath each car with a full working pressure of air. When it is desired to apply the brakes, the engineer's valve is shifted, and the air in the train-pipe is allowed to escape into the atmosphere at the engine. Thereupon the compressed air in the auxiliary reservoir closes valve No. 1, leading to the train-pipe, and opens the main valve No. 2, from the auxiliary reservoir to the brake-cylinder, whereby the piston of that cylinder operates upon the brake-levers and applies the brakes. By this use of the auxiliary reservoirs a practically simultaneous application of the brakes is secured for each car. This application of the brakes is secured, not by direct application of compressed air from the engine through the train-pipe, but by a reverse action, whereby the air is allowed to escape from the train-pipe toward the engine, the pressure being applied by the air escaping from the auxiliary reservoirs. It also results that, if a train should pull in two, or a car become detached, the same

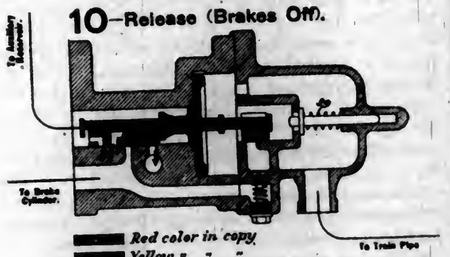
escape of air occurs, the same action takes place automatically at the broken part, and the same result follows by the escape of the compressed air through the separated couplings. When it is desired to release the brakes, the engineer's valve is again shifted, and the compressed air not only opens valve No. 1 from the train-pipe to the auxiliary reservoir, but valve No. 3 from the brake-cylinder to the open air, which allows the air from the brake-cylinder to escape and thus release the brake.

From this description it will be seen that the action of the automatic brake was, in fact, the converse of that of the straight air-brake, and that the result was to obviate the most serious defects which had attended the employment of the former.

This automatic brake appears, in its perfected form, in Patent No. 220,556, although this patent was but the culmination of a series of experiments, each successive step in which appears in the prior patents. Thus in Patent No. 124,404, (1872,) is introduced the auxiliary reservoir beneath each car in connection with a double line of brake-pipes and a single cock with suitable ports for charging the reservoir and for operating the brakes—a device which was obviously the foundation of the triple valve which first made its appearance in Patent No. 141,685, (1873,) in which the main valve, which admitted air from the auxiliary reservoir to the brake-cylinder, was of the puppet form; and as a puppet-valve can govern only one port, separate valves had to be provided for feeding in the air from the train-pipe to the auxiliary reservoir, and for discharging the air from the brake-cylinder to release the brakes. In subsequent patents, No. 144,006 (1873) and No. 163,242 (issued in 1875 to C. H. Perkins and assigned to Westinghouse), Mr. Westinghouse improved upon his prior devices by substituting a sliding piston-valve for the puppet form of main valve previously used by him. This enabled the piston to perform the feed-valve function of admitting air from the train-pipe to the auxiliary reservoir; the main-valve function of admitting air from the auxiliary reservoir to the brake-cylinder to apply the brakes, and the release-valve function of discharging the air from the cylinder to release the brakes. In Patent No. 168,359, (1875,) a piston actuating a slide-valve was substituted for the piston-valve, and, after a series of experiments, which did not seem to have been successful, he introduced into Patent No. 217,838 the idea of venting the train-pipe, not only at the locomotive, but also under each car, in order to quicken the application of the brakes. Prior to this time—

when the engineer desired to apply his brakes with full force he operated the valve at the engine and opened the port wide, letting the compressed air out of the train-pipe at the locomotive, then its only vent. The air, as before said, had to travel from the rear cars along the cars forward to the engine before it could lessen the pressure of the train-pipe air * * * and before the brake-cylinder could be operated with air from the auxiliary reservoirs. In a train of fifty cars it would have to travel nearly half a mile to get out at the engine.

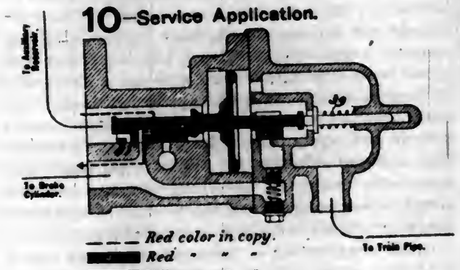
He embodied in Patent No. 220,556, (1879,) the most complete form of the automatic brake, as stated by the court below—



the ordinary work of braking was performed by a partial traverse of its chamber by the triple-valve piston, graduated according to the purpose desired, at the will of the engineer, and emergency work was done by an extreme traverse of the piston to the end of its chamber.

While the automatic brake had thus obviated the most important defects of the old or straight air-brake, and came into general use upon passenger-trains throughout the country, it was found, in practice upon long freight-trains, that the air from the auxiliary reservoirs did not act with sufficient promptness upon the brakes of the rear cars, where a particularly speedy action was required, and that it would be necessary to devise some other means for cases of special emergency. In the business of transporting freight over long distances, the tendency has been in the direction of increasing the load by using stronger and heavier cars and larger locomotives. Upon a long train of this kind, composed of thirty to fifty cars, a demand was made for quicker action in cases of emergency than had yet been contemplated, although for ordinary work, such as checking the speed of a train while running, holding it at a slow speed on a downgrade, and also for making the ordinary station stops, the automatic brake was still sufficient, and produced satisfactory results even in the equipment of long and heavy trains. But however effective for ordinary purposes, the automatic brake did not sufficiently provide for certain emergencies, requiring prompt action, and, therefore, failed in a single important particular.

Upon examination of these defects it was found that they could only be remedied by securing, (1) in cases of emergency, a more abundant discharge of compressed air into the brake-cylinder; and (2) an escape of air near to each triple valve without requiring the escaping air to travel all the way back to the engine. The latter device having been already embodied in Patent No. 217,838, these features Mr. Westinghouse introduced into the patent in suit, by which a passage was opened directly from the train-pipe, filled from the main reservoir on the engine, to the brake-cylinder through which, in cases of emergency, the train-pipe air, instead of being discharged into the atmosphere, could pour directly from the train-pipe into the brake-cylinder. This operation resulted in charging the brake-cylinder and applying the brakes more quickly than before, and also, by reason of the fact that the filling of the brake-cylinder from the train-pipe on one car made what was, in effect, a local vent for the release of pressure sufficient to operate the valve on the next car behind, each successive valve operated more quickly than when a diminution of pressure was caused by an escape of air only at the locomotive. The direct passage of the air from the train-pipe to the brake-cylinder was effected by a valve (41) colored red in the above diagrams, which is never opened except in cases of emergency. In ordinary cases, when the brakes are desired to be applied, sufficient air is released from the train-pipe to open the passage from the auxiliary reservoir to the brake-cylinder by what is called a preliminary traverse of the piston (12), but when a



quick action is required sufficient air is drawn from the train-pipe, not only to open this passage, but by a further traverse of the piston, to shove valve 41 off its port, and introduce air directly from the train-pipe to the brake-cylinder, as shown in the third drawing, above set forth.

In the foregoing skeleton drawings, from which all details of construction, and all figures of reference, not necessary for a clear understanding of the structure, are omitted, the essential parts are colored, so that their changes of position in the different stages of action can be easily followed.

The access of train-pipe air is shown located at the right end of the structure, instead of the left, (as in the patent drawings,) simply for greater clearness. Its course from the train-pipe to the auxiliary cylinder is through the small port above the upper arm of the piston 12.

The "main valve" of the triple is *black*. Its office is to admit auxiliary-reservoir air to brake-cylinder.

The "quick-action" valve is colored *red*. Its office is to admit *train-pipe air* to brake-cylinder.

The release-port is colored *green*. Its office is to discharge air from brake-cylinder, in releasing the brakes.

There is also shown in *yellow* what is known as the graduating-valve, the function of which will be hereinafter explained. As at present used, the triple valve is in reality a quadruple valve.

The flow or movement of air, in the several positions of the structure is also shown by colored lines and arrows, viz:

Air released from brake-cylinder to open air by *green* arrow.

Air flowing from auxiliary reservoir to brake-cylinder, in "service" application of the brakes, by *red* line. And air flowing from train-pipe to brake-cylinder in "quick-action" application, by *blue* line.

This patent, although it introduced a novel feature into the art, does not seem to have been entirely successful in its practical operation, since in October of the same year an improvement was patented, No. 376,837, with the object of still further increasing the rapidity of action. As observed by the district judge in this connection—

> The success of this improved device, No. 376,837, has demonstrated that the invention, by which the further traverse of the triple-valve piston beyond the extent of the traverse required for the ordinary application of the brakes, is made to admit a large volume of train-pipe air directly to the brake-cylinder, was one of great importance. The proofs show that a quick-action automatic brake, which would give the results which this brake has accomplished, was eagerly sought after by inventors and car-builders, and all had failed until Westinghouse discovered that it could be done by this mode of operation.

We are now in position to take up the several claims of the patent in suit, and their defenses thereto. It may be stated generally that the position of complainants in this connection is, that the novel feature of this patent, in respect to which they are entitled to be protected, is the opening of a passage directly from the train-pipe to the brake-cylinder, without passing through the auxiliary reservoir and without reference to the means by which such passage-way is controlled. Defendants' theory is that they are limited to such passage-way when governed by the auxiliary valve 41, a device which, although of no utility as arranged in the patent in suit, became afterward exceedingly useful when further combined with the supplementary piston shown in Patent No. 376,837. The further inference is that, as they do not use the auxiliary valve of this patent, they cannot be held liable as infringers.

Complainants' case must rest either upon the theory that the admission of compressed air directly from the train-pipe to the brake-cylinder is patentable as a function, or that the means employed by the defendants for that purpose are a mechanical equivalent for the auxiliary valve 41, described in the patent.

1. The first theory is based upon the second claim, which is—

> In a brake mechanism, the combination of a main air-pipe, an auxiliary reservoir, a brake-cylinder, and a triple valve having a piston, whose preliminary traverse admits air from the auxiliary reservoir to the brake-cylinder, and which by a further traverse admits air directly from the main air-pipe to the brake-cylinder, substantially as set forth.

In the construction of this claim, the district

judge was of opinion that it was broad enough to cover other devices in which air was admitted directly from the train-pipe to the brake-cylinder by the further traverse of the piston actuating a valve admitting such air, and that the defendants could not exculpate themselves from the charge of infringement, from the fact that in their device the train-pipe air was admitted through the triple-valve chamber, and not through a by-passage, nor by the fact that in their device the further traverse of the piston opens the main valve in a special manner, which produces the same result, but does not make use of a separate auxiliary valve.

Upon the other hand, the Circuit Court of Appeals held that—

> the transmission of train-pipe air and auxiliary-reservoir air simultaneously to the brake-cylinder is a result of [or] function, and is not patentable; [that] the means by which this or any other result or function is accomplished may be many and various, and if these several means are not mechanical equivalents, each of them is patentable.

It was of opinion that when the second claim—

> in its language describing the action of that device, failed to describe any means by which the extreme traverse of the piston produced it, declaring merely that the piston, "by a further traverse, admits air directly from the main air-pipe to the brake-cylinder," it was fatally defective, claiming only a result which is public property, and not identifying the specific means (his own property) by which the result is achieved.

It is true, as observed by the Court of Appeals, that the further traverse of the piston for use in cases of emergency had been shown in prior patents, but it had never been employed for the purpose of admitting air directly from the main air-pipe to the brake-cylinder until the patent in suit was taken out.

The claim in question is, to a certain extent, for a function, viz., the admission of air directly from the train-pipe to the brake-cylinder, and is only limited to such function when performed by the further traverse of the piston of the triple valve. This limitation, however, does not obviate the objection that the means are not fully and specifically set forth for the performance of the function in question.

The difficulty we have found with this claim is this: That, if it be interpreted simply as a claim for the function of admitting air to the brake-cylinder directly from the train-pipe, it is open to the objection, held in several cases to be fatal, that the mere function of a machine cannot be patented.

This rule was clearly laid down in the leading case of *Corning* v. *Burden*, (15 How., 252,) in which Mr. Justice Grier, delivering the opinion of the Court, drew the distinction between such processes as were the result or effect of—

> chemical action, by the operation or application of some element or power of nature, or of one substance to another,

and the mere result of the operation of a machine, with regard to which he says:

> It is for the discovery or invention of some practicable method or means of producing a beneficial result or effect that a patent is granted, and not for the result or effect itself. It is when the term process is used to represent the means or method of producing a result that it is patentable, and it will include all methods or means which are not effected by mechanism or mechanical combinations.
>
> But the term process is often used in a more vague sense, in which it cannot be the subject of a patent. Thus we say that a board is undergoing the process of being planed, grain of being ground, iron of being hammered or rolled. Here the term is used subjectively or passively as applied to the material operated on, and not to the method or mode of producing that operation, which is by mechanical means, or the use of a machine, as distinguished from a process.
>
> In this use of the term it represents the function of a machine, or the effect produced by it on the material subjected to the action of the machine. But it is well settled that a man cannot have a patent for the function or abstract effect of a machine, but only for the machine which produces it.

In the subsequent case of *Burr* v. *Duryee*, (1 Wall., 531, 570,) Mr. Justice Grier laid down the same principle as follows:

> The patent act grants a monopoly to any one who may have discovered or invented any new and useful art, machine, manufacture or composition of matter. * * * The law requires that the specification "should set forth the principle and the several modes in which he has contemplated the application of that principle, or character by which it may be distinguished from other inventions, and shall particularly point out the part, improvement, or combination which he claims as his own invention or discovery." We find here no authority to grant a patent for a "principle" or a mode of operation, or an *idea*, or any other abstraction. A machine is a concrete thing, consisting of parts, or of certain devices and combination of devices. The principle of a machine is properly defined to be its mode of operation, or that peculiar combination of devices which distinguish it from other machines. A machine is not a principle or an idea. The use of ill-defined abstract phraseology is the frequent source of error. It requires no great ingenuity to mystify a subject by the use of abstract terms of indefinite or equivocal meaning. Because the law requires a patentee to explain the mode of operation of his peculiar machine which distinguishes it from others, it does not authorize a patent for a "mode of operation as exhibited in the machine," much less can any inference be drawn from the statute, that an inventor who has made an improvement in a machine, and thus effects the desired result in a better or cheaper manner than before can include all previous inventions and have a claim to the whole art, discovery, or machine which he has improved. All others have an equal right to make improved machines, provided they do not embody the same, or substantially the same devices, or combination of devices, which constitute the peculiar characteristics of the previous invention.

So also in *Fuller* v. *Yentzer*, (11 O. G., 551; 94 U. S., 288,) this Court, speaking through Mr. Justice Clifford, also said:

> Patents for a machine will not be sustained if the claim is for a result, the established rule being that the invention, if any, within the meaning of the patent act, consists in the means or apparatus by which the result is obtained, and not merely in the mode of operation independent of the mechanical devices employed; nor will a patent be held valid for a principle or for an idea, or any other mere abstraction.

Most of the prior authorities upon this subject are reviewed in the recent case of *Risdon Locomotive Works* v. *Medart*, (71 O. G., 751; 158 U. S., 68,) in which it was also held that a valid patent could not be obtained for a process which involved nothing more than the operation of a piece of mechanism, or the function of a machine. See also to the same effect *Wicke* v. *Ostrum*, (19 O. G., 867; 103 U. S., 461, 469.) These cases assume, although they do not expressly decide, that a process to be patentable must involve a chemical or other similar elemental action, and it may be still regarded as an open question whether the patentability of processes extends beyond this class of inventions. Where the process is simply the function or operative effect of a machine, the above cases are conclusive against its patentability; but where it is one which, though ordinarily and most successfully performed by machinery, may also be performed by simple manipulation, such, for instance, as the folding of a paper in a peculiar way for the manufacture of paper bags, or a new method of weaving a hammock, there are cases to the effect that such a process is patentable, though none of the powers of nature be invoked to aid in producing the result. (*Eastern Paper Bag Co.* v. *Standard Paper Bag Co.*, 41 O. G., 231; 30 Fed. Rep., 63; *Union Paper Bag Machine Co.* v. *Waterbury*, 39 Ib., 389; *Travers* v. *Am. Cordage Co.*, 70 O. G., 277; 64 Ib., 771.) This case, however, does not call for an expression of our opin-

ion upon this point, nor even upon the question whether the function of admitting air directly from the train-pipe to the brake-cylinder be patentable or not, since there is no claim made for an independent process in this patent, and the whole theory of the specification and claims is based upon the novelty of the mechanism.

But if the second claim be not susceptible of the interpretation that it is simply for a function, then the performance of that function must be limited to the particular means described in the specification for the admission of air from the train-pipe to the brake-cylinder. This we understand to be the theory of the defendants, and this raises the same question which is raised under the first and fourth claims, whether defendants' device contains the auxiliary valve of the Westinghouse patent, or its mechanical equivalent.

In this view, it becomes unnecessary to express an opinion whether the second claim be valid or not, since in the aspect of the case most favorable to the complainants, it is necessary to read into it something which is not fonnd there, or, in the language of complainants' brief—

> to refer back to the specification; not, it is true, for a slavish adoption of the identical instrumentalities therein described, but for the understanding of the essential and substantial features of the means therein illustrated.

In thus reading the specification into the claim, we can adopt no other construction than to consider it as if the auxiliary valve were inserted in the claim in so many words, and then to inquire whether the defendants make use of such valve, or its mechanical equivalent.

There are two other facts which have a strong bearing in the same connection, and preclude the idea that this can be interpreted as a claim for a function, without reading into it the particular device described in the specification.

One of these is that the claim is for a triple-valve device, etc., for admitting air from the main air-pipe to the brake-cylinder, "substantially as set forth." These words have been uniformly held by us to import into the claim the particulars of the specification, or, as was said in *Seymour* v. *Osborne*, (11 Wall., 516, 547)—

> where the claim immediately follows the description of the invention, it may be construed in connection with the explanations contained in the specifications; and where it contains words referring back to the specifications, it cannot be properly construed in any other way.

In that case it was held that a claim which might otherwise be bad, as covering a function or result, when containing the words "substantially as described," should be construed in connection with the specification, and when so construed was held to be valid. To the same effect is *The Corn Planter Patent*, (6 O. G., 392; 23 Wall., 181, 218.)

Again, it appears from the file-wrapper and contents, that in his original application Mr. Westinghouse made a broad claim for the admission of air directly from the main air-pipe to the brake-cylinder, which was rejected upon reference to a prior patent to Boyden, No. 280,285, and that on January 19, 1887, his attorney wrote the Patent Office in the following terms:

> It is respectfully submitted that while the Boyden patent No. 280,285 referred to, shows that what the inventor terms "an always-open one-way passage," by which communication may be established under certain conditions, between the main air-pipe or train-pipe, and hence might be held to meet the terms of the claim as originally broadly drawn, yet it fails to embody a device which in structure or function corresponds with the auxiliary valve of applicant, which in no sense relates to "an always-open one-way passage." This amended claim, above submitted, prescribes a valve device actuated by the piston of the triple valve for admitting air to the brake-cylinder in the application of the brake, while Boyden's check-valve *d* is not actuated by the piston, and is designed to recharge the auxiliary reservoir and brake-cylinder while the brakes are on. It is submitted, as to claim 2, that a piston, which by its preliminary traverse, admits air from the auxiliary reservoir to the brake-cylinder and by its further traverse admits air directly from the main air-pipe to the brake-cylinder, as set forth in said claim, is not found in the Boyden patent, the check-valve *d* of which is described as actuated by the manipulation of the cock *q* on the locomotive to "recharge and continue charging the reservoir and brake-cylinder while the brakes are applied." * * * It is to be understood that applicant *does not seek to broadly claim a device for admitting air directly from the main air-pipe to the brake-cylinder*, as the four-way cock long heretofore employed by him (similar to the cock K of the Boyden patent) would be a structure of such character. When, however, the triple valve is provided with an *auxiliary valve, operated by its piston which performs a new function* additional to that of the triple valve as previously employed, it is believed that such *combination* is wholly novel.

So, too, in the specification it is stated:

> So far as the performance of its preliminary function in ordinary braking is concerned—that is to say, effecting the closure of communication between the main air-pipe and the auxiliary reservoir, and the opening of communication between the auxiliary reservoir and the brake-cylinder in applying the brakes, and the reverse operations in releasing the brakes—the triple valve 10 accords substantially with that set forth in Letters Patent of the United States No. 220,556, granted and issued to me October 14, 1879, and is not, therefore, saving as to the *structural features* by which it performs the further function of effecting the direct admission of air from the main air-pipe to the brake-cylinder, as presently to be described, claimed as of my present invention.

Apparently, too, in consequence of the above letter of January 19, 1887, the patentee erased from his original specification the following sentence:

> Further, while in the specific construction described and shown, the function of admitting air from the main pipe is performed by a valve separate from that which effects the preliminary admission of reservoir-pressure to the cylinder, a modification in which the same office is performed by a valve integral with the main valve and formed by an extension thereof, would be included in and embody the essential operative features of my invention—

and inserted in its place the following:

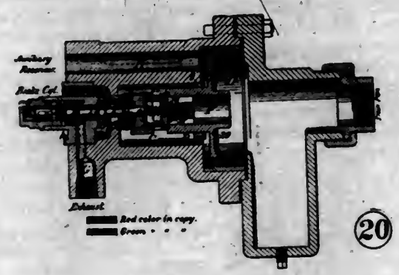
> I am aware that a construction in which "an always-open one-way passage" from the main air-pipe to the brake-cylinder is uncovered by the piston of the triple valve simultaneously with the opening of the passage from the auxiliary reservoir to the brake-cylinder, has been heretofore proposed, and such construction, which involves an operation different from that of my invention, I therefore hereby disclaim.

We agree with the defendant that this correspondence, and the specification as so amended, should be construed as reading the auxiliary valve into the claim, and as repelling the idea that this claim should be construed as one for a method or process. Language more explicit upon this subject could hardly have been employed.

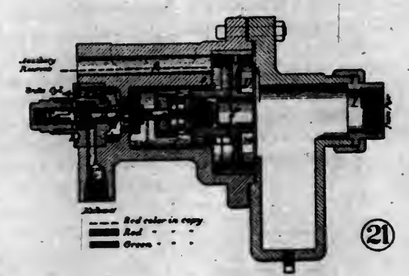
While it is true that no claim is formally made for the admission of train-pipe air directly to the brake-cylinder as a method or process, a construction is given by the complainants and the circuit court to the second claim which eliminates the mechanical features described, and one which could only be supported upon the theory that the claim was for a method or process. If the mechanism described by Westinghouse, and particularly the auxiliary valve, be not essential to the validity of the second claim, then it could only be supported upon the theory that it was for the process of admitting train-pipe air directly to the brake-cylinder.

2. The first and fourth claims of this patent are as follows:

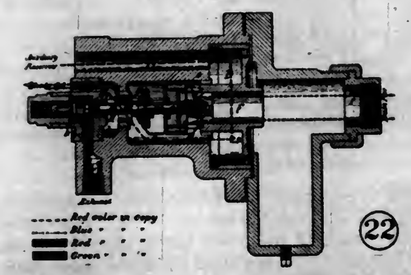
1. In a brake mechanism, the combination of a main air-pipe, an auxiliary reservoir, a brake-cylinder, a triple valve, and an auxiliary-valve device, actuated by the piston of the triple valve and independent of the main valve thereof, for admitting air in the application of the brake directly from the main air-pipe to the brake-cylinder, substantially as set forth.



4. The combination, in a triple-valve device, of a case or chest, a piston fixed upon a stem and working in a chamber therein, a valve moving with the piston-stem and governing ports and passages in the case leading to connections with an auxiliary reservoir and a brake-cylinder and to the atmosphere, respectively, and an auxiliary valve actuated by the piston-stem and controlling communication between passages leading to connections with a main air-pipe and with the brake-cylinder, respectively, substantially as set forth.



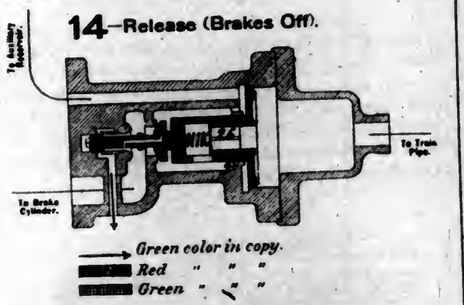
These two claims are practically little more than different expressions of one and the same invention. In both of them there is a main air-pipe, an auxiliary reservoir, a brake-cylinder, a triple valve and piston, described in the fourth claim as "fixed upon a stem and working in a chamber" in a case or chest, and an auxiliary valve; and in the fourth claim also a case or chest, which contains the whole device, and is immaterial.



In both of these claims an auxiliary valve is named as an element. In the first it is described as "actuated by the piston of the triple valve and independent of the main valve thereof;" and in the fourth as "actuated by the piston-stem and controlling communication between passages leading to connections with the main air-pipe and with the brake-cylinder."

To what liberality of construction these claims are entitled depends to a certain extent upon the character of the invention, and whether it is what is termed in ordinary parlance a "pioneer." This word, although used somewhat loosely, is commonly understood to denote a patent covering a function never before performed, a wholly novel device, or one of such novelty and importance as to mark a distinct step in the progress of the art, as distinguished from a mere improvement or perfection of what had gone before. Most conspicuous examples of such patents are: the one to Howe of the sewing-machine; to Morse of the electrical telegraph; and to Bell of the telephone. The record in this case would indicate that the same honorable appellation might be safely bestowed upon the original air-brake of Westinghouse, and, perhaps also, upon his automatic brake. In view of the fact that the invention in this case was never put into successful operation, and was to a limited extent anticipated by the Boyden patent of 1883, it is perhaps an unwarrantable extension of the term to speak of it as a "pioneer," although the principle involved subsequently and through improvements upon this invention became one of great value to the public. The fact that this invention was first in the line of those which resulted in placing it within the power of an engineer, running a long train, to stop in about half the time and half the distance within which any similar train had stopped, is certainly deserving of recognition, and entitles the patent to a liberality of construction which would not be accorded to an ordinary improvement upon prior devices. At the same time, as hereinafter observed, this liberality must be exercised in subordination to the general principle above stated: that the function of a machine cannot be patented, and, hence, that the fact that the defendants' machine performs the same function is not conclusive that it is an infringement.

The device made use of by the defendants is exhibited in Patents Nos. 481,134 and 481,135, both dated August 16, 1892, and both of which were granted after the commencement of this suit. There are two forms of this patent, one of which, illustrated in Patent No. 481,135, is here given in its three positions of release (20), service application (21), and quick action (22).



In this device there is found a main air-pipe, an auxiliary reservoir, a brake-cylinder, a triple, or rather a quadruple, valve and piston (29) with three ports; first, for the admission of air from the train-pipe to the brake-cylinder through the feeding-in valve 26; second, for the passage of air from the auxiliary reservoir to the brake-cylinder through the apertures *i*, *j*, *k* in the stem slide-valve 18; and, third, for the release of air from the brake-cylinder to the exhaust-port by means of valve 17, colored green. Whether this device has an auxiliary valve or not is one of the main questions in the case, complainants' theory being that puppet-valve 22 is an

auxiliary valve, while defendants' claim is that it is in reality the main valve.

The operation of this device is best shown by the foregoing skeleton drawings.

The auxiliary reservoirs are charged by air under pressure, entering from the train-pipe, raising and passing through the feeding-in-valve piston 26, and flowing slowly into and through the passage A to the auxiliary reservoir, until such reservoir is filled. In this condition the brake-cylinder is emptied and opened to the atmosphere through the exhaust-passage G.

In order to apply the brakes gradually, so as to slacken speed or make an ordinary stop, air-pressure in the train-pipe is reduced slightly (say from three to five pounds) by action of the engineer's valve, and the reduction of pressure on the right side of the piston 29 causes the piston to make what is termed a "preliminary traverse" to the position shown in diagram "Service application." Such preliminary traverse pulls the stem slide-valve 18 to the right, and opens the apertures *i*, *j* and *k*, (one of these apertures being to the right and the other to the left of valve 22,) and through these apertures air rushes from the auxiliary reservoir to the brake-cylinder; but the puppet-valve 22 still remains upon its seat.

If quick action be required, the pressure in the train-pipe is suddenly lowered to the extent of fifteen or twenty pounds, and the traveling piston 29, instead of making a preliminary traverse to the intermediate position shown in the "Service application," makes a full traverse to the extreme right, the effect of which is that the valve 22 is pulled off its seat by the collar M, and a large passage is opened to the brake-cylinder under the valve 22 and around the stem 18. The result is, as shown in the last diagram, that not only does the air in the auxiliary reservoir escape in full volume to the brake-cylinder, but air from the train-pipe rushes directly to the brake-cylinder through the large passage F into the chamber C and under valve 22.

The argument of the defendants in this connection is that, in this device, there is no auxiliary valve or by-passage, but the quick-action result is effected simply by proportioning the ports and passages of the old triple valve and using a fixed partition, 9, to divide the piston-chamber D from the main-valve chamber C; that it is this partition which produces the quick action, and that such partition is not a valve, nor the mechanical equivalent of a valve, but merely a metal ring screwed immovably into the triple-valve casing, and serving to divide the piston-chamber from the main-valve chamber; that this partition was a new element, never before found in triple valves, and introduced a new principle and mode of operation, totally different from anything ever invented by Mr. Westinghouse or any other inventor, and that its effect is to make valve 22, termed by them the main valve, admit the train-pipe air to the brake-cylinder at the same time that it admits the auxiliary air thereto.

It is claimed that, in embodying this new principle, Mr. Boyden adopted the form of triple valve shown in the expired Westinghouse patent No. 141,685, (1873,) in which the main valve, 22, is of the puppet form, and the separate valve 17, controlled by a rod sliding through the main valve, is employed for releasing the brakes. For charging the auxiliary reservoir he adopted, from the expired Westinghouse patent No. 144,006, (1873,) a check-valved feed-passage through the triple-valve piston, but arranged the feed-passage and its check-valve, 26, in a tubular extension, F, of the piston, and substantially in the form shown in Boyden patent No. 280,285, (1883.) He also provided a sensitive graduating-valve, similar in results to the graduating-valve *e'* of the Westinghouse patent No. 220,556, (1879,) by so arranging a small passage, 40, in the sliding stem, which actuates the release-valve, that such passage will be opened and closed by the sliding of such stem through the main valve 22. As thus constructed, the triple valve operates

much the same as that of Patent No. 220,556, and, like the latter, is incapable of quick action.

In both the complainants' and defendants' devices there is (1) a feeding-in valve to charge the auxiliary reservoir; (2) a valve which complainants call their "main valve," and which the defendants denominate a "graduating-valve," which is opened by the preliminary traverse of the piston to admit reservoir-air to the brake-cylinder; (3) a release-valve which discharges air from the brake-cylinder to the atmosphere; and (4) a quick-action valve—41 in the complainants' patent, and 22 in the defendants'—which is opened by the further traverse of the piston to admit train-pipe air to the brake-cylinder. In defendants' patent, it may also be used to admit auxiliary-reservoir air to the brake-cylinder.

One of the main controversies in the case turns upon the construction and operation of the puppet-valve 22, called by the defendants their "main valve." Complainants insist that the office of *their* main valve is performed by the stem slide-valve 18 of defendants' patent, and by its apertures *i*, *j* and *k*, through which air passes from the auxiliary reservoir to the brake-cylinder, and that the puppet-valve 22 is only called into action in emergency cases, when a large quantity of air is suddenly withdrawn from the train-pipe, and the valve is unseated by the traverse of the piston to the extreme right.

There is no doubt that the function of admitting air from the auxiliary reservoir to the brake-cylinder, which is performed in the Westinghouse patent by what the complainants term the main valve, (aided, however, by the graduating-valve,) is, in ordinary cases, performed principally, if not altogether, by the stem slide-valve 18 and its three ports *i*, *j*, *k*, of the Boyden patent, which defendants term their graduating-valve. It is equally clear that, in emergencies, where quick action is required, air, which in the Westinghouse patent passes through auxiliary valve 41, (opened by the further traverse of the piston,) in the Boyden patent finds its way through the puppet-valve 22, which has also been lifted from its seat by the further traverse of the piston.

One of the main differences between the two devices is this: That in the preliminary traverse of the piston of the Westinghouse patent, there is a movement, first, of the graduating-valve to open its port from the auxiliary reservoir, and then of the main valve, carrying the graduating-valve also with it, to open a passage to the brake-cylinder, while in the Boyden patent it is only the graduating-valve which is opened by the preliminary traverse of the piston. In doing this the graduating-valve moves *through* the puppet-valve, but does not lift it from its seat. In emergency cases not only do the graduating-valve and the main valve of the Westinghouse patent move as before, but, by the extreme traverse of the piston, the auxiliary valve 41 is shoved from its seat, and a separate passage is opened for the air from the train-pipe to the brake-cylinder. In the Boyden patent, however, the extreme traverse of the piston lifts the puppet-valve from its seat, and opens a wide passage to the brake-cylinder, not only for the air from the auxiliary reservoir, but, through the peculiar operation of the partition 9 and its aperture B, directly from the train-pipe. As the graduating-valve of the Boyden patent practically does all the work in ordinary cases, and the puppet-valve is only called into action in emergency cases, the latter is practically an auxiliary valve, by which, we understand, not necessarily an independent valve, nor one of a particular construction, but simply a valve which in emergency cases is called into the assistance of the graduating-valve. In this particular, the puppet-valve of the Boyden device performs practically the same function as the slide-valve 41 of the Westinghouse. It is not material in this connection that it is a puppet-valve while the other is a slide-valve, since there is no invention in substituting one valve or spring of familiar shape for another; (*Imhaeuser* v. *Buerk*, 17 O. G., 795; 101 U. S., 647, 656;) nor, that in one case the piston *pushes* the valve off its seat, and in the other *pulls* it off; nor is it material that this puppet-valve may have been used in prior patents to perform the function of a main valve, so long as it is used for a different purpose here. Indeed, this valve seems to have been taken bodily from Westinghouse patent No. 141,685, where it was used as a main valve, and the stem-valve 18 with its ports *i*, *j*, *k*, added for ordinary uses, and the puppet-valve thus converted from a main valve to an auxiliary valve.

We have not overlooked in this connection the argument that the puppet-valve 22 is also sometimes used for graduating purposes, but it is not commonly so used, and appears to be entirely unnecessary for that purpose. It seems to be possible to move the piston 29 to its extreme traverse so slowly, and hence to open valve 22 so gradually, that the pressure in the chamber C will be reduced so slightly, that the train-pipe air will not have sufficient force to throw open the check-valve 26, and hence, in such case no train-pipe air will be admitted directly to the brake-cylinder, which will be filled with auxiliary-reservoir air only. But, as a matter of fact, this seldom or never takes place in the practical operation of the device, and is an unnecessary and wholly unimportant incident, and for all practical purposes valve 22 is solely a quick-action valve. As this valve is actuated by the piston of the triple valve, and in such action is independent of the main valve, it meets the demand of the first claim of the patent, and as it is actuated by the piston-stem, and controls communication between passages leading to connections with the main air-pipe and with the brake-cylinder, it seems also to be covered by the fourth claim.

But even if it be conceded that the Boyden device corresponds with the letter of the Westinghouse claims, that does not settle conclusively the question of infringement. We have repeatedly held that a charge of infringement is sometimes made out, though the letter of the claims be avoided. (*Machine Co.* v. *Murphy*, 13 O. G., 366; 97 U. S., 120;

Ives v. *Hamilton*, 10 O. G., 336; 92 U. S., 341; *Morey* v. *Lockwood*, 8 Wall., 230; *Elizabeth* v. *Pavement Company*, 97 U. S., 137; *Sessions* v. *Romadka*, 59 O. G., 939; 145 U. S., 29; *Hoyt* v. *Horne*, 59 O. G., 1764; 145 U. S., 302.) The converse is equally true. The patentee may bring the defendant within the letter of his claims, but if the latter has so far changed the principle of the device that the claims of the patent, literally construed, have ceased to represent his actual invention, he is as little subject to be adjudged an infringer as one who has violated the letter of a statute has to be convicted, when he has done nothing in conflict with its spirit and intent.

> An infringement [says Mr. Justice Grier in *Burr* v. *Duryee*, 1 Wall., 531, 572] involves substantial identity, whether that identity be described by the terms "same principle," same "*modus operandi*," or any other. * * * The argument used to show infringement assumes that every combination of devices in a machine which is used to produce the same effect, is necessarily an equivalent for any other combination used for the same purpose. This is a flagrant abuse of the term "equivalent."

We have no desire to qualify the repeated expressions of this Court to the effect that, where the invention is functional, and the defendant's device differs from that of the patentee only in form, or in a rearrangement of the same elements of a combination, he would be adjudged an infringer, even if, in certain particulars, his device be an improvement upon that of the patentee. But, after all, even if the patent for a machine be a pioneer, the alleged infringer must have done something more than reach the same result. He must have reached it by substantially the same or similar means, or the rule that the function of a machine cannot be patented is of no practical value. To say that the patentee of a pioneer invention for a new mechanism is entitled to every mechanical device which produces the same result is to hold, in other language, that he is entitled to patent his function. Mere variations of form may be disregarded, but the substance of the invention must be there. As was said in *Burr* v. *Duryee*, (1 Wall., 531, 573,) an infringement—

> is a copy of the thing described in the specification of the patentee, either without variation, or with such variations as are consistent with its being in substance the same thing. If the invention of the patentee be a machine, it will be infringed by a machine which incorporates in its structure and operation the substance of the invention; that is, by an arrangement of mechanism which performs the same service or produces the same effect in the same way, or substantially the same way. * * * That two machines produce the same effect will not justify the assertion that they are substantially the same, or that the devices used are, therefore, mere equivalents for those of the other.

Not only is this sound as a general principle of law, but it is peculiarly appropriate to this case. Under the very terms of the first and fourth claims of the Westinghouse patent, the infringing device must not only contain an auxiliary valve, or its mechanical equivalent, but it must contain the elements of the combination, "substantially as set forth." In other words, there must not only be an auxiliary valve, but substantially such a one as is described in the patent, *i. e.*, independent of the triple valve. Not only has the Boyden patent a puppet instead of a slide valve—a matter of minor importance—but it performs a somewhat different function. In the Westinghouse patent the valve is not in the line of travel between the auxiliary reservoir and the brake-cylinder, and admits train-pipe air only. In the Boyden patent, it is in the line of travel, both from the auxiliary reservoir and from the train-pipe, and admits both currents of air to the brake-cylinder. The by-passage, to which the auxiliary reservoir is merely an adit, is wholly wanting in the Boyden device, both currents of air uniting in chamber C and passing to the brake-cylinder together, through the puppet-valve.

But a much more radical departure from the Westinghouse patent is found in the partition 9, separating the valve-chamber C from the piston-chamber D. This partition has an aperture, B, the capacity of which is less than that of the large passage A, and intermediate in size between that of the graduating-passage 40, and that of the port covered by the valve 22. The office of this partition is thus explained by the defendants in their briefs:

> When the engineer's valve is thrown wide open, the puppet-valve is lifted from its seat by the extreme traverse of the piston, and a new action takes place. The port of the main valve 22 is so much larger than the passage B, that the pressure in the main-valve chamber C is instantly emptied into the brake-cylinder, and, as the passage B cannot supply air so fast as the main-valve port can exhaust it, the pressure in the main-valve chamber suddenly drops to about five pounds. Meanwhile the passage A, leading from the auxiliary reservoir to the inner end of the piston-chamber, is so much larger than the passage B leading from the piston-chamber to the main-valve chamber, that full reservoir-pressure is maintained in the piston-chamber between the partition 9 and the inner side of the piston, thereby holding the piston back firmly at its extreme traverse. But the feed-valve 26 is now exposed on the one side to a train-pipe pressure of about fifty-five pounds, and on the other side to a main-valve-chamber pressure of only about five pounds, and therefore valve 26 is instantly forced open by the greater train-pipe pressure, which then vents freely through the said feed-valve port into the main-valve chamber C, where it commingles with the auxiliary-reservoir air passing through said chamber, and both airs pass together through the port opened by the main valve 22 to the brake-cylinder. The whole operation is substantially instantaneous, and the result is that the train-pipe is freely vented at each car, the time of serially or successively applying the brakes of the several cars from one end of the train to the other is reduced to a minimum, and the train is quickly stopped without shock, a result which Mr. Westinghouse did not attain with the device of Patent No. 360,070, nor did he attain it until he had invented his later apparatus of Patent No. 376,837, not here in suit.

In a word, this partition maintains upon the outside of valve 26 a much higher pressure than upon the inside, the effect of which is to open feed-valve 26 and admit a full volume of train-pipe air upon the brake-cylinder.

Conceding that the functions of the two devices are practically the same, the means used in accomplishing this function are so different that we find it impossible to say, even in favor of a primary patent, that they are mechanical equivalents. While the puppet-valve, which, for the purposes of this case, we may term the auxiliary valve, is in its operation independent of the main valve, the word "independent" in the claims of the Westinghouse patent evidently refers to a valve auxiliary to the triple valve, and independently located as well as operated. The difference is that in one case the air from the train-pipe is introduced into the brake-cylinder separately and independently from the air from the auxiliary reservoir; while in the other case they unite in the chamber C and pass through the same valve to the brake-cylinder. In the Westinghouse patent there is one valve operated by the direct thrust of the piston, opening a by-passage; in the other, there is a puppet-valve also opened by the piston, and another valve, 26, opened by

the pressure maintained upon the outside of the partition 9.

It is claimed, however, by the complainants that Boyden was not the inventor of the differential pressure theory; that there is such a differential pressure in their own patent, caused by the fact that the air from the auxiliary reservoir in passing to the brake-cylinder travels through a restricted port, 35, and, as the entrance to the brake-cylinder is through a much larger port, the air is taken up by it much more rapidly than it is supplied by the restricted port, which reduces the pressure in the by-passage so much that when the quick-action valve 41 is opened, the pressure from the train-pipe air is sufficient to open the valve 49 and admit a full volume of train-pipe air, at a pressure of fifty-five pounds, to the brake-cylinder. The fact, however, that no suggestion is made in the patent of such a function of the restricted port 35, indicates either that none such had been discovered, or that it was not considered of sufficient importance to mention it. Indeed, it seems to have been an afterthought, suggested by the necessity of an answer to the defendants' argument, based upon their partition 9. That when the auxiliary valve is opened there must be a difference in pressure above and below the check-valve 49, in order to open it, is manifest; yet, this is rather an incident to the Westinghouse device than the controlling feature that it is made in the Boyden patent. There is no partition in the proper sense of the word—certainly none located as in the Boyden device—between the chambers D and C, and no aperture in such partition opened for the express purpose of maintaining this differential pressure. If such differential pressure existed to the extent claimed in the Westinghouse patent, it certainly was not productive of the results flowing from the same device in the Boyden patent.

We are induced to look with more favor upon this device, not only because it is a novel one and a manifest departure from the principle of the Westinghouse patent, but because it solved at once in the simplest manner the problem of quick action, whereas the Westinghouse patent did not prove to be a success until certain additional members had been incorporated into it. The underlying distinction between the two devices is that in one, a separate valve and separate by-passage are provided for the train-pipe air, while in the other, the patentee has taken the old triple (or quadruple) valve, and by a slight change in the functions of two of its valves and the incorporation of a new element, (partition 9,) has made a more perfect brake than the one described in the Westinghouse patent. If credit be due to Mr. Westinghouse for having invented the function, Mr. Boyden has certainly exhibited great ingenuity in the discovery of a new and more perfect method of performing such function. If his patent be compared with the later Westinghouse patent No. 376,837, which appears to have been the first completely successful one, the difference between the two, both in form and principle, becomes still more apparent, and the greater simplicity of the Boyden patent certainly entitles it to a favorable consideration. If the method pursued by the patentee for the performance of the function discovered by him would naturally have suggested the device adopted by the defendants, that is in itself evidence of an intended infringement; but, although Mr. Boyden may have intended to accomplish the same results, the Westinghouse patent, if he had had it before him, would scarcely have suggested the method he adopted to accomplish these results. Under such circumstances, the law entitles him to the rights of an independent inventor.

Upon a careful consideration of the testimony we have come to the conclusion that the Boyden device is not an infringement of the complainants' patent, and the decree of the Circuit Court of Appeals is, therefore, affirmed.

DISSENTING OPINION.

Mr. Justice SHIRAS, with whom concurred Mr. Justice BREWER, dissented and filed the following opinion:

I am unable to concur in the reasoning and conclusion of the Court, and shall briefly state my views.

The history of the art discloses that the patent in suit was what is called a "pioneer invention." In it, for the first time, was brought to light a method or process which, by the coöperation of the air from the train-pipe with that from the car-reservoir, created the "quick-action" brake. The patent, in its specification and claims, clearly described a machine or mechanical combination whereby the invention was exemplified or rendered operative.

It is not an unwarrantable extension of the term to speak of this invention in suit as a pioneer, since it is practically conceded in this case, and justly observed by the court below, "one of the highest value to the public," and conspicuously one "which entitles the proprietor to a liberal protection from the courts in construing the claim." The very fact that this invention resulted in placing it within the power of an engineer, running a long train, to stop in about half the time and half the distance within which any similar train had been stopped, is certainly deserving of recognition. The claims of such patents have from time out of mind been allowed a liberal construction, and considered as entitled to the fullest benefit of the doctrine of mechanical equivalents.

It in no wise detracts from the merit of this invention that later devices have been adopted which render its practical operation more efficient. The very term, "pioneer patent," signifies that the invention has been followed by others. A pioneer patent does not shut but opens the door for subsequent invention.

The particular patent in suit was, as I understand it to be admitted, an entire success in supplying passenger-trains and short freight-trains with a "quick-action" brake; but while it enabled

even the longest freight-trains to stop in half the time and half the distance previously occupied, there remained difficulties which required further devices to give to the invention the perfect success which it has now attained.

Being of the character so described as a pioneer, the patent in suit is entitled to a broad or liberal construction. In other words, the invention is not to be restricted narrowly to the mere details of the mechanism described as a means of carrying the invention into practicable operation.

I cannot assent to what is, perhaps, rather intimated than decided in the opinion of the Court that what is called a "process in order to be patentable must involve a chemical or other similar elemental action." The term process or method, as describing the subject of a patent, is not found in the statutes. No reason is given in the authorities, and I can think of none in the nature of things, why a new process or method may not be patentable, even though a mechanical device or a mechanical combination may be necessary to render the new process practicable. It seems to be used by the courts as descriptive of an invention which, from its novelty and priority in the art to which it belongs, is not to be construed as inhering only in the particular means described, in the Letters Patent, as sufficient to exemplify the invention and bring it into practical use.

Thus in the case of *Winans* v. *Denmead*, (15 How., 330,) the patent was for a new form of the body of a car for the transportation of coal, thus avoiding certain practical difficulties or disadvantages in such cars as previously made. To the argument on behalf of the infringer, that the claim of the patent was confined to a single form, and only through and by that form to the principle which it embodies, this Court said, per Mr. Justice Curtis:

> It is generally true that when a patentee describes a machine, and then claims it as described, that he is understood to intend to claim, and does by law actually cover, not only the precise form he has described, but all other forms which embody his invention; it being a familiar rule that to copy the principle or mode of operation described is an infringement, although such copy should be totally unlike the original in form or proportions. It is not sufficient to distinguish this case to say that here the invention consists in a change of form, and the patentee has claimed one form only. Patentable improvements in machinery are almost always made by changing some one or more forms of one or more parts, and thereby introducing some mechanical principle or mode of action not previously existing in the machine, and so securing a new improved result. And in the numerous cases in which it has been held that to copy the patentee's mode of operation was an infringement, the infringer had got forms and proportions not described, and not in terms claimed. If it were not so, no question of infringement could arise. If the machine complained of were a copy, in form, of the machine described in the specification, of course, it would be at once seen to be an infringement. It could be nothing else. It is only ingenious diversities of form and proportion, presenting the appearance of something unlike the thing patented, which rise to questions; and the property of inventors would be valueless if it were enough for the defendant to say: Your improvement consisted in a change of form; you describe and claim but one form; I have not taken that, and so have not infringed.
>
> The answer is: My infringement did not consist in a change of form; but in the new employment of principles or powers, in a new mode of operation, embodied in a form by means of which a new or better result is produced; it was this which constituted my invention; this you have copied, changing only the form. * * * Where form and substance are inseparable it is enough to look at the form only. Where they are separable—where the whole substance of the invention may be copied in a different form—it is the duty of courts and juries to look through the form for the substance of the invention—for that which entitled the inventor to his patent, and which the patent was designed to secure; where that is found there is an infringement; and it is not a defense that it is embodied in a form not described and in terms claimed by the patentee. Patentees sometimes add to their claims an express declaration to the effect that the claim extends to the thing patented, however its form or proportions may be varied. But this is unnecessary. The law so interprets the claim without the addition of those words.

McCormick v. *Talcott*, (20 How., 402,) was also a case of a mechanical patent, and it was said by Mr. Justice Grier, who delivered the opinion of the Court:

> If the patentee be the original inventor of the device or machine, he will have a right to treat as infringers all who make machines operating on the same principle and performing the same functions by analogous means or equivalent combination, even though the infringing machine may be an improvement of the original and patentable as such.

In *Morley Machine Co.* v. *Lancaster*, (47 O. G., 267; 129 U. S., 263,) there was also a question of an alleged invention of a primary character, and wherein the invention was embodied in a mechanical combination; and it was held that, in a pioneer patent, such as that of Morley, the patentee, the special devices set forth by Morley were not necessary constituents of the claims; that his patent was to receive a liberal construction, in view of the fact that he was a pioneer in the construction of an automatic button-sewing machine, and that his patent was not to be limited to the particular devices or instrumentalities described by him.

In that case extended and approving reference was made to the case of *Proctor* v. *Bennis*, (36 Ch. Div., 740,) which was a case of an invention embodied in a mechanical contrivance, and the following language of Lord Justice Bowen was quoted:

> Now, I think it goes to the root of this case to remember that this is, as was described by one of the counsel, really a pioneer invention; and it is by the light of that, as it seems to me, that we ought to consider whether there have been variations or omissions and additions, which prevent the machine which is complained of from being an infringement of the plaintiff's. With regard to the additions and omissions, it is obvious that additions may be an improvement and that omissions may be an improvement; but the mere fact that there is an addition, or the mere fact that there is an omission, does not enable you to take the substance of the plaintiff's patent. The question is not whether the addition is material or whether the omission is material, but whether what has been taken is the substance and essence of the invention.

These were cases wherein the discovery or invention was made effective through machines or mechanical combinations, and wherein it was held that the merit of the process or method was not to be confined, in the case of a pioneer patent, to the mere form described in the specification as sufficient to make the invention practically operative.

Neilson's patent, (Web. Pat. Cas., 275,) was a noted case, in which the true distinction was drawn between a mere principle, as the subject of a patent, and a process by which a principle is applied to effect a new and useful result. The Court of Exchequer, in answering the objection that Neilson's patent was for a principle, said:

> It is very difficult to distinguish it from the specification of a patent for a principle, and this at first created in the minds of some of the court much difficulty; but, after full consideration, we think the plaintiff does not merely claim a principle, but a machine embodying a principle, and a very valuable one. We think the case must be considered as if, the principle being well known, the plaintiff had first invented a mode of applying it by a mechanical apparatus to furnaces; and his invention consists in this—by interposing a receptacle for heated air between the blowing apparatus and the furnace. In this receptacle he directs the air to be heated by the application of heat externally to the receptacle, and thus he accomplishes the object of applying to the blast, which was, before of cold air, in a heated state to the furnace.

And when the case came before the House of Lords, Lord Campbell said:

> After the construction first put upon the patent by the learned judges of the Exchequer, I think the patent must be taken to extend to all machines, of whatever construction, whereby the air is heated intermediately between the blowing apparatus and the blast-furnace. That being so, the learned judge was perfectly justified in telling the jury that it was unnecessary for them to compare one apparatus with another, because, confessedly, that system of conduit-pipes was a mode of heating air by an intermediate vessel between the blowing apparatus and the blast-furnace, and, therefore, it was an infringement of the patent. (Web. Pat. Cas., 715.)

Very applicable to the present case is the doctrine of *Tilghman* v. *Procter*, (19 O. G., 859; 102 U. S., 707.) It was there held, overruling the case of *Mitchell* v. *Tilghman*, (5 O. G., 299; 19 Wall., 284,) that a patent may be validly granted for carrying a principle into effect; and if the patentee suggests and discovers not only the principle, but suggests and invents how it may be applied to a practical result by mechanical contrivances and apparatus, and shows that he is aware that no particular sort or modification of form of apparatus is essential to obtain benefit from the principle, then he may take his patent for the mode of carrying it into effect, and is not under the necessity of confining himself to one form of apparatus.

Having discussed the previous cases, particularly that of Neilson and of *O'Reilly* v. *Morse*, (15 How., 62,) Mr. Justice Bradley said:

> Whoever discovers that a certain useful result will be produced in any art by the use of certain means is entitled to a patent for it, provided he specifies the means. But everything turns on the force and meaning of the word "means." It is very certain that the means need not be a machine, or an apparatus; it may be a process. A machine is a thing. A process is an act, or a mode of acting. The one is visible to the eye—an object of perpetual observation. The other is a conception of the mind, seen only by its effects when being executed or performed. Either may be the means of producing a useful result. * * * Perhaps the process is susceptible of being applied in many modes and by the use of many forms of apparatus. The inventor is not bound to describe them all in order to secure to himself the exclusive right to the process, if he is really its inventor or discoverer. But he must describe some particular mode, or some apparatus, by which the process can be applied with at least some beneficial result, in order to show that it is capable of being exhibited and performed in actual experience.

The *Telephone Cases* (43 O. G., 377; 126 U. S., 1, 533) contain an apt illustration of these principles. Mr. Chief Justice Waite, in discussing the case, said:

> In this art, or, what is the same thing, under the patent law, this process, this way of transmitting speech, electricity, one of the forces of nature, is employed; but electricity, left to itself, will not do what is wanted. The art consists in so controlling the force as to make it accomplish the purpose. It had long been believed that if the vibrations of air caused by the voice in speaking could be reproduced at a distance by means of electricity, the speech itself would be reproduced and understood. How to do it was the question.
>
> Bell discovered that it could be done by gradually changing the intensity of a continuous electric current, so as to make it correspond exactly to the changes in the density of the air caused by the sound of the voice. This was his art. He then devised a way in which these changes of density could be made and speech actually transmitted. Thus his art was put in a condition for practical use. In doing this, both discovery and invention, in the popular sense of those terms, were involved; discovery in finding the art, and invention in devising the means of making it useful. For such discoveries and such inventions the law has given the discoverer and inventor the right to a patent—as discoverer, for the useful art, process, method of doing a thing he has found; and as inventor, for the means he has devised to make the discovery one of actual value. * * * The patent for the art does not necessarily involve a patent for the particular means employed for using it. Indeed, the invention of any means, in the specification or descriptive portion of the patent, is only necessary to show that the art can be used; for it is only useful arts—arts which may be used to advantage—that can be made the subject of a patent. The language of the statute is that "any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter," may obtain a patent therefor. Thus, an art—a process—which is useful, is as much the subject of a patent, as a machine, manufacture or composition of matter. * * * But it is insisted that the claim cannot be sustained, because when the patent was issued Bell had not in fact completed his discovery. While it is conceded that he was acting on the right principles, and had adopted the true theory, it is claimed that the discovery lacked that practical development which was necessary to make it patentable. In the language of counsel, "there was still work to be done, and work calling for the exercise of the utmost ingenuity, and calling for the very highest degree of practical invention." It is quite true that when Bell applied for his patent he had never actually transmitted telegraphically spoken words so that they could be distinctly heard and understood at the receiving end of his line, but in his specification he did describe, accurately and with admirable clearness, his process, that is to say, the exact electrical condition that must be created to accomplish his purpose, and he also described with sufficient precision to enable one of ordinary skill in such matters to make it a form of apparatus which, if used in the way pointed out, would produce the required effect, receive the words, and carry them to and deliver them at the appointed place. The particular instrument he had and which he used in his experiments did not, under the circumstances in which it was tried, reproduce the words spoken so that they could be clearly understood. But the proof is abundant and of the most convincing character that other instruments, carefully constructed and made exactly in accordance with the specification, without any additions whatever, have operated and will operate successfully. The law does not require that a discoverer or inventor, in order to get a patent for a process, must have succeeded in bringing his art to the highest degree of perfection. It is enough if he describes his method with sufficient clearness and precision to enable those skilled in the matter to understand what the process is, and if he points out some practicable way of putting it into operation. * * * Surely a patent for such a discovery is not to be confined to the mere means he improvised to prove the reality of his conception.

The conclusion justified by the authorities is that whether you call Westinghouse's discovery, that "quick action" may be accomplished by the coöperation of the main-pipe air and that from the car-reservoir, a process, or a mode of operation, yet if he was the first to disclose it and to describe a mechanical means to give practical effect to the invention, he must be regarded as a pioneer inventor, and as entitled to protection against those who, availing themselves of the discovery, seek to justify themselves by pointing to mere differences in form in the mechanical devices used.

Much stress was laid in the argument on an alleged disclaimer by the patentee while the application was pending in the Patent Office, whereby it is said Westinghouse must be understood to have abandoned the second claim, or, at any rate, to have consented that that claim should be interpreted by the courts as if it contained an auxiliary valve as a material element in the claim.

There are cases, no doubt, in which it has been held that when a claimant has, under objection in the Patent Office, withdrawn certain claims, or has modified them by adding or striking out terms or phrases, and accepts a patent which does not grant the abandoned or unmodified claims, he cannot be heard to insist upon such a construction of the allowed claims as would cover what had been previously rejected. (*Shepard* v. *Carrigan*, 34 O. G., 1157; 116 U. S., 593; *Roemer* v. *Peddie*, 49 O. G., 2151; 132 U. S., 313; *Corbin Lock Co.* v. *Eagle Lock Co.*, 65 O. G., 1066; 150 U. S., 38.)

An examination of the cited cases, however, will disclose, as I think, that they turned upon matters of construction. In other words, were cases where it was questionable what the patent, as actually granted, meant. In such cases, as in other cases of ambiguity, it may be allowable to consult the application and file wrapper, and possibly written communications, which may throw light upon claims that are ambiguous or capable of different constructions.

But where the claims allowed are not uncertain or ambiguous, the courts should be slow to permit their construction of a patent, actually granted and delivered, to be affected or controlled by alleged interlocutions between the officers in the Patent Office and the claimant. No doubt, in proceedings to re-

voke or cancel a patent granted by inadvertence or by fraudulent representations, it would be competent to show what had taken place in the Patent Office pending the application. But when we consider that often the employees in the Patent Office are inexperienced persons, and that the mass of the business is so vast that it is impossible for the Commissioner or the Chief Examiner to review it, except in a perfunctory way, it can be readily seen how dangerous it would be to modify or invalidate a patent, clear and definite in its terms, by resorting to such uncertain sources of information.

However this may be, I do not perceive that the matters alleged in the present case are entitled to any weight in the construction of the patent. Even if the letter of the claimant's attorney, written on January 19, 1887, can be looked to as helping us to understand the meaning of a patent granted on March 29, 1887, it only appears to be an argument as to the meaning or legal effect of the language used in the claims, and does not amount to a withdrawal or modification of them.

Accordingly the second claim of the patent is before us for construction on its own terms, and, to avoid protracting this discussion, the opinion of Judge Morris in the circuit court is referred to and adopted as a sound construction of that claim. (66 Fed. Rep., 997.) This claim is not, as I read it, open to the objection that it aims to patent a principle. It sets forth the discovery that by a cooperation of the air from the auxiliary reservoir and that from the main air-pipe, the action of the brakes is quickened and the air vented from the main air-pipe directly to the brake-cylinder.

But, even if the second claim must, as argued in the opinion of the Court, be read, by reason of the letter of the claimant's attorney, as if it called for the auxiliary valve described in the first and fourth claims, and even if, when not so read, it can be regarded as void because simply for a function or principle, nevertheless the invention, as described in the other claims and specification, is clearly set forth, and, under the evidence as to the state of the art, is entitled to be regarded as a pioneer. Regarding the second claim as a mere statement of the idea or invention and the other claims as describing a form or combination of mechanism which embodies the invention and renders it operative, all the requisites of the law are sufficiently complied with.

The only remaining question is that of the infringement, and that is readily disposed of. For it is conceded in the opinion of the majority of the Court that, if the patent in suit is entitled to a broad construction as a pioneer, embodying a new mode of operation, not limited to the particular means described in the specification, then the defendant's device is an adoption of the idea or principle of the Westinghouse patent with a mechanical equivalent or substitute for the auxiliary valve.

Upon the whole I am of the opinion that the decree of the Circuit Court of Appeals should be reversed and that the cause should be remanded with directions to restore the decree of the circuit court.

Mr. Justice BREWER concurred in the dissenting opinion.

Mr. Justice GRAY and Mr. Justice MCKENNA also dissented from the opinion and from the decision of the Court.

Complete Applications.

(ORDER No. 1,304.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 20, 1898.

It is hereby ordered that applications shall not be given serial numbers as complete applications and forwarded to the examining divisions for examination (1) when the petition has not been signed by the inventor; (2) when the specification and claims have not been signed by the inventor and the signature attested by two witnesses; (sec. 4888, Rev. Stats.;) (3) when the drawing has not been signed by the inventor or his attorney in fact and the signature attested by two witnesses; (sec. 4889, Rev. Stats.;) and (4) when the oath to the application does not fill the requirements of sections 4865 and 4892, Revised Statutes.

The requirements of section 4896, Revised Statutes, respecting the right of executor or administrator to make application for a patent for the invention of a deceased person must also be observed before the application will be considered as complete and forwarded for examination. The legal requirements in cases where the application is made by a foreign administrator are stated in *ex parte Ransome*, (C. D., 1870, 143.)

Under existing law no right is given to the guardian of an insane person to make an application for a patent for the invention of said insane person, and such application will not be received for examination.

This order, so far as applicable, relates to applications for the registration of trade-marks, labels, and prints, which must in all respects comply with the requirements of the statutes.

C. H. DUELL,
Commissioner.

Notice to Show Cause.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 7, 1898.

The following notice to show cause is published in the OFFICIAL GAZETTE for the reason that it has been found impracticable to serve notice in the usual way, a registered letter containing notice to the same effect, mailed to Mr. Holgate at his last-known address, having been returned with the report that it could not be delivered.

To George H. Holgate, doing business under the name of the Association American Inventors, last known address Betz Building, Philadelphia, Pennsylvania, present address unknown:

SIR: Copies of charges filed against you as representative of the Association American Inventors by the following-named persons were sent you on the dates mentioned below, and you were given until February 12, 1898, to answer the same, if you desired to do so:

I. N. Fickes, of Holland, Kans.....January 21, 1898.
Nathan Lloyd, of Greenbrier, Mo.....January 22, 1898.
J. L. Zeiger, of Cleveland, Ohio .....January 22, 1898.
John McWilliams, of Egypt Mills, Mo ..February 5, 1898.

You were informed in the letters accompanying the charges of McWilliams, Lloyd, and Fickes that, inasmuch as you were not registered as a patent attorney, disbarment proceedings would not be instituted. It has been determined, however, that inasmuch as you still represent a number of applicants before this Office in applications filed before the 1st of January, 1898, as is shown by a list of such cases filed by your representative on January 14, 1898, and in which registration was waived, said list numbering 171 cases, you are practicing before the Office and within the provisions of the statute you are subject to disbarment proceedings. In view of this fact and in view of the fact that in some of the foregoing cases the filing of the answer was made optional with you you are hereby required to show cause on or before the 15th day of June, 1898, in each of these cases, why you should not be disbarred from practice and why the Commissioner of Patents should not refuse to recognise you as patent agent in accordance with the statutes in such cases made and provided.

C. H. DUELL,
Commissioner.

CERTIFICATES OF REGISTRATION ISSUED MAY 24, 1898.

Labels.

6,891.—Title: "COURT'S GREAT STOMACH AND NERVE TONIC." *Thora Petersen*, Chicago, Ill. Application filed March 19, 1898.

6,892.—Title: "VELVETTA KID." (For Leather and Kid.) *Frank Crocker*, Washington, D. C. Application filed April 13, 1898.

Prints.

64.—Title: "JUST OUT." (For Cigars.) *American Lithographic Company*, New York, N. Y. Application filed April 26, 1898.

65.—Title: "THE CONTINENTAL GOLD BOND." (For a Suit of Clothes.) *Freeland-Loomis Company*, Boston, Mass. Application filed March 14, 1898.

66.—Title: "BUFFALO LITHIA WATER." *Thomas F. Goode*, Boydton, Va. Application filed April 20, 1898.

67.—Title: "HAMMOND TYPE WRITER FOR ALL NATIONS AND TONGUES." *The Hammond Typewriter Company*, New York, N. Y. Application filed March 7, 1898.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business May 17, 1898.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	In arrears—Between two and three months.			
108	XIX. Stoves and Furnaces	Feb. 21	May 5	347
209	XIV. Metal-Bending, Wire-Working, Coin-Controlled Apparatus, Farriery, Nut and Bolt Locks, etc.	Mar. 2	May 4	235

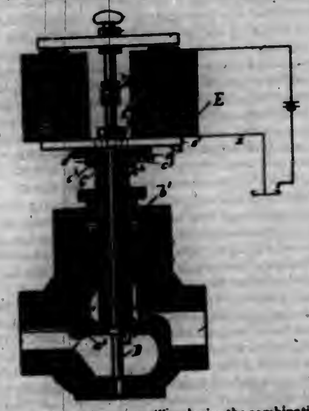
PATENTS



GRANTED MAY 24, 1898.

604,357. COLLAR-BUTTON AND NECKWEAR-RETAINER. JOHN ARMER, Philadelphia, Pa. Filed Sept. 10, 1896. Serial No. 605,251. (No model.)

Claim.—A button consisting of a head, and a two-part expansible shank with shoulders thereon, in combination with the depending plate G, having a slot to receive said shanks, the walls of said slot engaging with said shoulders, an upwardly-extending resilient portion H forming with said plate the loop J and the closing neck K at the top of said portion.

604,358. VALVE-CONTROLLING DEVICE. WALTER S. ALEXANDER, New York, N. Y., assignor, by mesne assignments, to the New Jersey Valve Company, of New Jersey. Filed Feb. 24, 1896. Serial No. 580,341. (No model.)

Claim.—1. In a valve-controlling device the combination of a main valve normally closed by the pressure controlled thereby, a motor to operate said main valve, consisting of a cylinder and piston, a valve-stem secured to the piston and valve-head with a port passing through said stem to the pressure lying before the valve, and leading to the cylinder and an exhaust, two auxiliary valves interposed within said port operating conjointly, one adapted normally to close the supply-port to the motor, by the operation of the pressure controlled by the main valve, and the other operating abnormally to close the exhaust from the motor while the supply-port is opened, and means to operate said auxiliary valves substantially as described.

2. In a valve-controlling device, the combination of a main valve, having a valve-head adapted to be seated by the pressure controlled by said valve; a motor to operate said main valve, consisting of a cylinder and piston, a valve-stem secured to the piston, and the main-valve head, a port through said main-valve head and stem, leading to the cylinder and an exhaust, an auxiliary-valve stem adapted to operate within said port through the main-valve stem, said auxiliary-valve stem provided with two valve-heads, one head adapted normally to be seated by the pressure controlled by the valve, and to close the said supply-port leading to the motor, and the other head operating conjointly with the first to close the said port leading from the motor to an exhaust when the supply-port is open, and to open said exhaust when the supply-port is closed, and means to operate said auxiliary-valve stem, substantially as described.

3. In a valve-controlling device the combination of a main valve having a valve-head adapted to be seated by the pressure controlled by said valve, a motor to operate said main valve consisting of a cylinder and piston, a valve-stem secured to the piston and the main-valve head, a port through said main-valve head and stem, leading to the cylinder and to an exhaust, an auxiliary-valve stem adapted to operate within said port through the main-valve stem, said auxiliary-valve stem provided with two valve-heads, one head adapted normally to be seated, by the pressure controlled by the valve, and to close the said supply-port leading to the motor, and the other head operating conjointly with the first to close the said port leading from the motor, to an exhaust when the supply-port is open, and to open said exhaust when the supply-port is closed, and a motor suitably mounted and connected with the auxiliary-valve stem to operate the same substantially as described.

4. In a valve-controlling device, a main valve normally closed by the pressure controlled by said valve, a hollow valve-stem carrying the main-valve head, and a piston, a cylinder for said piston, a port through said hollow stem leading from the pressure lying before the valve to the cylinder, and to an exhaust, two auxiliary valves interposed in said port, operating together, to open the supply-port, and close the exhaust, or to close the supply-port and open the exhaust; an electromagnet suitably mounted on the main-valve stem, in circuit, and means to control said circuit, with an armature for said magnet secured to the auxiliary valves, to operate the same, substantially as described.

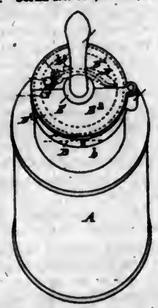
5. In a valve-controlling device, a main valve normally closed by the pressure controlled by said valve, a hollow valve-stem carrying the main-valve head, and a piston, a cylinder for said piston, a port through said hollow stem leading from the pressure lying before the valve to the cylinder, and to an exhaust; an auxiliary-valve stem adapted to operate within said hollow stem, and carrying two valve-heads suitably interposed in said port, and operating together to open the supply-port, and close the exhaust, or to close the supply and open the exhaust; an electromagnet suitably mounted on the main-valve stem, in circuit, with means to control said circuit, an armature for said magnet secured to the auxiliary-valve stem substantially as described.

6. In a valve-controlling device, a valve-chest with inlet and outlet ports through the same, and a valve-seat, a main-valve stem carrying a main-valve head and a piston, a port through the axis of said main-valve stem, leading to a cylinder and an exhaust; said port having valve-seats at either end, a cylinder for said piston, and an auxiliary-valve stem carrying two valve-heads, and means to operate said auxiliary-valve stem substantially as described.

7. In a valve-controlling device, a valve-chest with inlet and outlet ports through the same, and a valve-seat, a main-valve stem carrying a main-valve head; a piston and magnets, a port through the axis of said main-valve stem, leading to a cylinder, and an exhaust, said port having valve-seats at either end, a cylinder for said piston, an auxiliary-valve stem carrying two valve-heads, and an armature, an electromagnet, mounted on the main-valve stem said magnet in circuit, and means to control said circuit, substantially as described.

8. In a valve, the combination of a main valve, valve-stem, steam-cylinder and piston secured to the valve-stem for operating it, a steam-port for supplying steam to the cylinder, a valve controlling said port and an auxiliary-valve stem operating said valve, with an electro-magnet, mounted upon the main-valve stem and moving with it, and an armature for said magnet operating the auxiliary-valve stem.

9. The combination of the main valve, a piston whose movement controls the movement of the main valve, an auxiliary valve for controlling the movement of the fluid to the piston, an exhaust-valve



whose movement is controlled by the movement of the auxiliary valve, an electromagnetic mechanism for moving the auxiliary valve from its seat, and means connecting the part upon which the electromagnetic mechanism is mounted with the main valve.

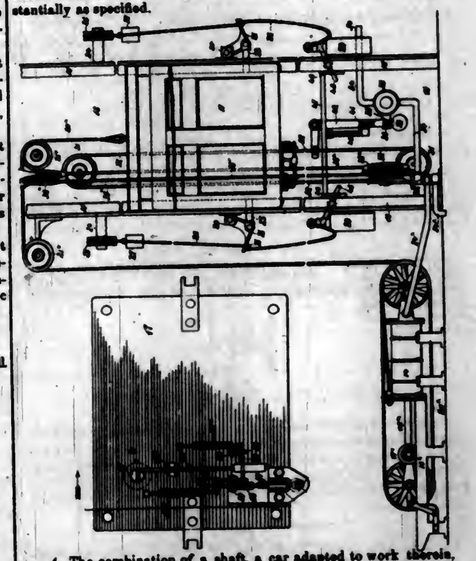
10. The combination of a main valve, a piston whose movement controls the movement of the main valve, an auxiliary valve for controlling the movement of the fluid to the piston, an armature secured to the stem of the auxiliary valve, a yoke secured to the main valve, and an electromagnetic mechanism mounted upon said yoke.

11. The combination of a main valve, a piston whose movement controls the movement of the main valve, an auxiliary valve for controlling the flow of the fluid to the piston, an electromagnetic mechanism for moving the auxiliary valve from its seat, and means for connecting the part upon which the electromagnetic mechanism is mounted to the main valve.

12. The combination of a main valve, a piston whose movement controls the movement of the main valve, a hollow valve-stem connecting the main valve with the piston, an auxiliary valve for controlling the flow of the fluid to the piston, and an electromagnetic mechanism for operating the auxiliary valve.

604,859. VESSEL-CLOSURE. WALDO P. BEAN, Bearmington, Ill.
Filed May 24, 1897. Serial No. 637,351. (No model.)

Claim.—1. The herein-described combined spring, latch and scraper, in combination with a fixed plate to which the spring member of said combined spring, latch and scraper is secured, and a complemental plate having a hinge connection with said fixed plate and acted against by the spring member of and adapted to be engaged with and locked by the latch member of said combined spring, latch and scraper, as set forth.



2. In a vessel-closure, the combination of a notched fixed plate attachable to a vessel, a complemental notched hinged plate connected with said fixed plate, a spring, a latch and a scraper supported on said fixed plate, and an annular brush-holder fitting in a central hole formed by the conjunction of the notches in said fixed plate and said hinged plate, as set forth.

604,860. SAFETY DEVICE FOR ELEVATORS. FRANK M. BELL, New York, N. Y., assignor of one-half to Wilma Pollack, same place.
Filed Nov. 22, 1897. Serial No. 639,358. (No model.)

Claim.—1. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, means arranged within the shaft adapted to operate said interposed cut-out mechanism, and means carried by said car adapted to engage the means arranged within the shaft whereby to operate the interposed cut-out mechanism to shut off the source of power and render the means for operating the car thereupon inoperable from the car, and arrest the movement of the car, substantially as specified.

2. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, means adapted to obstruct the movement of the car within the shaft, and means carried by the car adapted to operate the cut-out mechanism to shut off the source of power and render the means for operating the car thereupon inoperable from the car, and the obstructing means to arrest the movement of the car, substantially as specified.

3. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and means for operating the car, means adapted to obstruct the movement of the car within the shaft, a signal apparatus, means for operating said signal apparatus, and means carried by the car adapted to operate the cut-out mechanism to shut off the source of power, the obstructing means to arrest the movement of the car, and the signal apparatus to become operative, substantially as specified.

4. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, obstructing mechanism normally out of the path of the car adapted to be projected into the path thereof, means arranged within the shaft adapted to operate the interposed cut-out mechanism, and the obstructing mechanism, and means carried by the car adapted to engage the means arranged within the shaft whereby to operate the cut-out mechanism to shut off the power, and the obstructing mechanism to be projected into the path of the car, substantially as specified.

5. The combination of a shaft, a car adapted to work therein, and means for operating said car, with cut out mechanism interposed between the source of power and the means for operating the car, means adapted to obstruct the movement of the car within the shaft, means arranged within the shaft whereby to operate the cut-out mechanism, and the obstructing mechanism, and means carried by the car adapted to engage from any point of the shaft the means for operating the cut-out mechanism, and the obstructing mechanism, and cause the same to shut off the power, reader the means for operating the car thereupon inoperable from the car, and arrest the movement of the car, substantially as specified.

6. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, mechanism adapted to be projected from the sides of the shaft into the path of the car to arrest the movement thereof, means arranged within the shaft adapted to operate the cut-out mechanism, and the obstructing mechanism, and means carried by the car adapted to engage at any point within the shaft the means arranged therein whereby to simultaneously cause the same to operate the cut-out mechanism to shut off the source of power, and the obstructing mechanism to be projected into the path of the car to arrest the movement thereof, substantially as specified.

7. The combination of a shaft, a car adapted to work therein, and means for operating said car, with cut-out mechanism interposed between the source of power and the means for operating the car, obstructing devices arranged in the shaft, normally out of the path of the car, means for projecting said devices into the path of the car, means arranged at the side of the shaft adapted to operate the cut-out mechanism and the obstructing devices, and means carried by the car adapted to engage the means at the side of the shaft whereby to operate the cut out mechanism to shut off the power, and the obstructing devices to be projected into the path of the car, substantially as specified.

8. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, series of obstructing devices arranged upon opposite sides of the shaft, means for maintaining said obstructing devices normally out of the path of the car, means for projecting said devices into the path of the car, means arranged upon the side of the shaft adapted to operate the cut-out mechanism, and the means for projecting the obstructing devices, and mechanism carried by the car adapted to engage the means arranged upon the side of the shaft and cause the same to operate the cut-out mechanism to shut off the power, and the means for operating the obstructing devices to project said devices into the path of the car to arrest the movement thereof, substantially as specified.

9. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, series of obstructing devices arranged upon opposite sides of the shaft, means for maintaining said devices normally out of the path of the car, means for projecting said devices into the path of the car, an endless cable supported at one side of the shaft, extending through said shaft for its entire length, and connected with the cut-out mechanism, and means for operating the obstructing devices, a grip mechanism carried by the car adapted to be maintained out of engagement with the endless cable aforesaid, and means for bringing said grip mechanism into engagement with said endless cable to operate the cut-out mechanism to shut off the power, and the means for operating the obstructing devices to project the same into the path of the car to arrest the movement thereof, substantially as specified.

10. The combination of a shaft, a car adapted to work therein, and means for operating said car with cut-out mechanism interposed between the source of power and the means for operating the car, shafts secured to the outer sides of the elevator-shaft near the top thereof, pulleys mounted upon the ends thereof, cables having their uppermost ends passed over said pulleys and provided with counterweights, and their other ends extending downward and provided with weights, series of bolts arranged in opposite sides of the shaft, bearings secured upon the outer sides of the shaft above said bolts, bell-crank levers having their upper ends supported within said bearings, their apexes pivotally secured to the rear ends of the bolts, and their outer ends secured to the cables, aforesaid, means for supporting the weights secured to the lower ends of said cables, and means carried by the car whereby to operate from any point of the shaft the cut-out mechanism to shut off the power, and release the weights at the lower ends of the cables of their support to project the bolts into the path of the car, substantially as specified.

11. In a safety device for elevators, the shaft and car in combination with an endless cable arranged within the shaft and extending through the entire length thereof, a valve arranged within the shaft for controlling the supply of power to the hoisting mechanism, means for maintaining said valve open to permit of the passage of the fluid to the hoisting mechanism, means for closing said valve, a device having one end connected to the endless cable and another end in contact with the means for maintaining the valve open, said device being adapted to release the means for maintaining the valve open, and cause the valve to close and arrest the passage of the fluid to the hoisting apparatus, and means carried by the car, adapted to engage the endless cable at any point within the shaft to operate said valve to shut off the power, substantially as specified.

12. In a safety device for elevators, the shaft and car in combination with pulleys arranged within the shaft near the top and bottom thereof, an endless cable carried by said pulleys, a valve having a stem, an arm secured thereto and projecting beyond the same at the rear, a weight arranged upon the long end of said arm, and a spring-actuated catch arranged therein between the weight and the valve-stem, a bracket supported above said valve having a bell-crank pivotally supported thereon, the lower end of whose vertical member is adapted to lock against the spring-actuated catch in the valve-stem, a bell-crank supported at right angles to the bell-crank above named having a toe at the lower end of its vertical member against which the rearwardly-projecting end of the valve-stem arm is adapted to rest, and the end of its horizontal member connected with the endless cable, and means carried by the car adapted to engage said endless cable at any point within the shaft to operate said valve to shut off the power, substantially as specified.

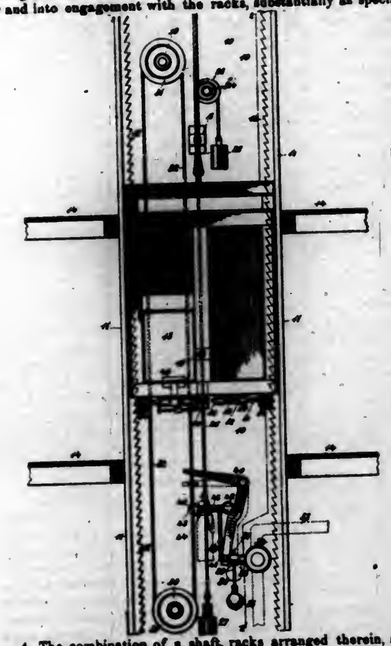
13. In a safety device for elevators, the shaft and car adapted to work therein in combination with pulleys supported within the shaft near the top and bottom thereof, an endless cable carried thereby, a grip carried by the car adapted to engage said endless cable, a valve arranged within the shaft intermediate the source of power and the hoisting mechanism, means for maintaining said valve to its open position, means for closing said valve, obstructing devices arranged in the sides of the shaft, normally out of the path of the car, adapted to be projected into the path of the car, means for projecting said devices into the path of the car, pulleys supported upon the outer sides of the shaft near the top thereof, cables secured to and connecting said projecting means having weights at their lower ends, and their upper ends passed over the pulleys, last mentioned, and provided with counterweights, levers pivotally supported in the sides of the shaft near the base thereof adapted to support at their outer ends the weights secured to the lower ends of the cables aforesaid, and levers pivotally supported upon the inner sides of the shaft having their forward ends connected with the inner ends of the weight-supporting levers and their rear ends united by a connecting-rod adapted to be supported by the mechanism for operating the valve whereby to maintain the weights upon the lower ends of the cables in position upon their supporting-levers when the valve is open, substantially as specified.

14. In a safety device for elevators, the shaft and car working therein, means for operating said car, mechanism operable from the car adapted to control the supply of power to the hoisting mechanism, obstructing devices normally out of the path of the car adapted to be projected into the path thereof, means for projecting said devices into the path of the car, combined with an electric signal apparatus, a source of electric supply for operating said signal apparatus, a contact-plate arranged within the shaft, conductors leading from said signal apparatus and including the source of electric supply, and having their terminals electrically connected with said contact-plate and a movable part of the mechanism for releasing the means for maintaining the valve open and the obstructing devices withdrawn from the shaft whereby to complete the electric circuit and cause the signal to become operative when the valve is closed, or the obstructing devices are projected into the path of the car, substantially as specified.

15. In a safety device for elevators, the combination with a car-body of a grip comprising a rigid member secured to the car-body, provided with a bifurcated portion extending beyond the outline of the car-body, a movable member adapted to work within said rigid member, said grip members having apertures in their projecting portions through which a cable is adapted to extend, means for maintaining said movable grip member normally drawn back and the aperture therein out of register with the apertures in the bifurcated projecting portion of the rigid member to grip the cable, and means operable from the interior of the car for projecting said movable grip member to bring the aperture in the projecting end thereof into register with the apertures in the bifurcated end of the rigid grip member to release the cable and permit of the free and uninterrupted movement of the car within the shaft, substantially as specified.

16. In a safety device for elevators, the combination with a car-body of a grip comprising a rigid member secured to the under side of the car-body having a bifurcated projecting portion, and a guide, a movable member adapted to work in said guide and intermediate the bifurcated projecting portion, apertures provided in the projecting portion of the rigid member, and an aperture provided in outer end of the movable member, through which apertures a cable is adapted to extend, bearings provided upon the under side of the car-body, two bell-cranks and an arm pivotally supported therein, a rod connecting the free end of said arm with the end of the horizontal member of one of said bell-cranks, a rod connecting the ends of the vertical members of the bell-cranks, a link connecting the rear end of the movable grip member with the end of the horizontal member of one of said bell-cranks, springs having their forward ends secured to the under side of the car-body, and their rear ends secured to the rod connecting the ends of the bell-cranks, and the rod connecting one bell-crank with the arm aforesaid, to hold the movable grip member normally drawn back, a bearing provided upon the under side of the car-body, a lever pivotally supported thereby having its rear end in contact with and bearing against the rod connecting one of the bell-cranks with the pivoted arm, and a foot-plate arranged upon the base of the car having a stem extending downwardly therefrom through the base of the car-body and bearing upon the forward end of the lever supported upon the under side thereof, substantially as specified

---



604,861. SAFETY DEVICE FOR ELEVATORS. FRANK M. BELL, New York, N. Y., assignor of one-half to Wilma Pollack, same place.
Filed Dec. 3, 1897. Serial No. 660,568. (No model.)

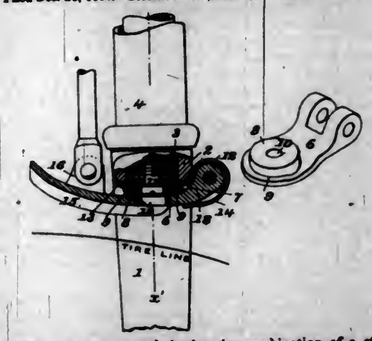
Claim.—1. The combination of a shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, and clutch mechanism carried by said car, with means operable from the car whereby to render inoperative from the car the means for operating said car, and project the clutch mechanism into engagement with the racks, substantially as specified.

2. The combination of a shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, and clutch mechanism carried by said car, with cut-out mechanism interposed between the source of power and the means for operating the car, and means operable from the car whereby to operate the cut-out mechanism to shut off the power and render the means for operating the car thereupon inoperable from the car, and project the clutch mechanism into engagement with the racks, substantially as specified.

3. The combination of a shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car,

clutches carried by said car, and means for holding said clutches normally within the outline of the car, with cut-out mechanism interposed between the source of power and the means for operating the car, a series of devices arranged within the shaft adapted to engage the clutch-holding means on the car, and means operable from the car whereby to operate the cut-out mechanism to shut off the power, and operate the devices arranged within the shaft to trip the clutch-holding means, and project the clutches beyond the outline of the car and into engagement with the racks, substantially as specified.

4. The combination of a shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, clutches carried thereby, and means arranged partly within and partly without the outline of the car adapted to hold the clutches normally within the outline of the car, with cut-out mechanism interposed between the source of power and the means for operating the car, a series of tripping devices arranged within the shaft normally out of the path of the projecting portion of the clutch-holding means carried by the car and means operable from the car whereby to operate the cut-out mechanism to shut off the power, and the trip mechanism to be projected into the path of the clutch-holding means to trip the same, and project the clutches into engagement with the racks, substantially as specified.



5. The combination of a shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, bearings arranged upon said car, rods supported therein, clutches disposed upon the outer ends thereof and heads upon the inner opposing ends thereof, springs for projecting said clutches outwardly, bearings arranged at right angles to those aforesaid, a rod supported therein, a double detent arranged thereon adapted to engage the inner opposing ends of the clutch-rods, a shoe carried upon the end of said rod beyond the outline of the car, with cut-out mechanism interposed between the source of power and the means for operating the car, a series of tripping devices arranged within the shaft normally out of the path of the shoe carried by the car, and means operable from the car whereby to operate the cut-out mechanism to shut off the power, and project the tripping devices into the path of the shoe aforesaid to release the clutches and cause the same to be projected into engagement with the racks, substantially as specified.

6. The combination of a shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, clutch mechanism carried by said car, means arranged partly within and partly without the outline of the car adapted to hold the clutches normally drawn back with a series of tripping devices arranged within the shaft normally out of the path of the clutch-holding means carried by the car, a cable secured to said tripping devices provided at its lower end with a weight, and at its upper end with a counterweight, cut-out mechanism interposed between the source of power and the means for operating the car, means for holding said cut-out mechanism in position to permit of the passage of the operating fluid therethrough, and support the weight at the lower end of the cable aforesaid, and means operable from the car whereby to release the aforesaid holding means and cause the cut-out mechanism to shut off the power, and release the weight to operate the tripping devices to trip the clutch-holding means carried by the car, substantially as specified.

7. The shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, clutch mechanism carried by said car, means arranged partly within and partly without the outline of the car adapted to hold the clutches normally drawn back combined with a series of tripping devices, each comprising a bolt, normally out of the path of the clutch-holding means carried by the car, a bell-crank for projecting said bolt, a link intermediate the rear end of the bolt and the bell-crank adapted to hold the bolt to its projected position, a cable secured to the bell-cranks of said tripping devices having a weight at its lower end, and a counterweight at its upper end, and cut-out mechanism interposed between the source of power and the means for operating the car, means for holding said cut-out mechanism in position to permit of the passage of the operating fluid therethrough, and support the weight at the end of the cable aforesaid, and means carried by the car adapted to release the holding means aforesaid and cause the cut-out mechanism to shut off the power, and release the weight to operate the tripping devices, substantially as specified.

8. The shaft, racks arranged therein, a car adapted to work within said shaft, means for operating said car, grip mechanism carried by said car, clutch mechanism likewise carried by said car, means for holding said clutches drawn back, tripping devices arranged within the shaft adapted to release the clutch-holding means, a cable for operating said tripping devices having a weight at its lower end, and a counterweight at its upper end, combined with an endless cable extending through the shaft, adapted to be engaged by the grip mechanism carried by the car, a valve having a stem, an arm secured thereto extending beyond the valve-stem at the rear thereof, a weight arranged upon the outer end of said arm, a spring-actuated catch arranged in said arm intermediate its weighted end and the valve-stem, a bell-crank pivotally supported above said valve having the end of its horizontal member secured to the endless cable and the end of its vertical member provided with a toe adapted to contact with the end of the arm projecting at the rear of the valve-stem, a bell-crank pivotally supported at right angles to the one above named, the horizontal member of which is adapted to receive and support the weight on the cable for operating the tripping devices, and its vertical member adapted to lock against the spring-actuated catch in the valve-stem arm, substantially as specified.

604,862. BICYCLE-BRAKE. CHARLES P. BIRNER, Chicago, Ill., assignor to the Monarch Cycle Manufacturing Company, same place. Filed Dec. 20, 1897. Serial No. 662,732. (No model.)

Claim.—1. In a bicycle-brake, the combination, of a steering-fork provided near the lower end of its steering-post with a cross-bar or projection that is formed with a screw-threaded orifice, a bracket formed with a circular projection fitting the bore of the steering-post, a marginal flange surrounding said projection, and rearwardly-projecting pivot-ears, a spring formed with an attaching-eye fitting the circular projection of the bracket, and with a loop portion encircling the pivot-ears of said bracket, with its free end bearing on the under surface of the brake-shoe forward of its pivotal attachment, a brake-shoe of a curved-plate formation pivoted to the pivot-ears of the bracket, and extending forward between the fork sides, and an attaching-bolt passing through the bracket and screwing into the screw-threaded orifice in the cross-bar or projection of the steering-fork, substantially as set forth.

2. In a bicycle-brake, the combination, of a steering-fork provided near the lower end of the steering-post with a cross-bar or projection that is formed with a screw-threaded orifice, a bracket formed with a circular projection fitting the bore of the steering-post, a marginal flange surrounding said projection, and rearwardly-projecting pivot-ears, a spring formed with an attaching-eye fitting the circular projection of the bracket and with a loop portion encircling the pivot-ears of said bracket, with its free end bearing on the under surface of the brake-shoe forward of the pivotal attachment, a brake-shoe of a curved-plate formation pivoted to the pivot-ears of the bracket, and extending forward between the fork sides and an attaching-bolt passing through the bracket and screwing into the screw-threaded orifice in the cross-bar or projection of the steering-fork, the said shoe being formed with an orifice in line with the head of said attaching-bolt, substantially as set forth.

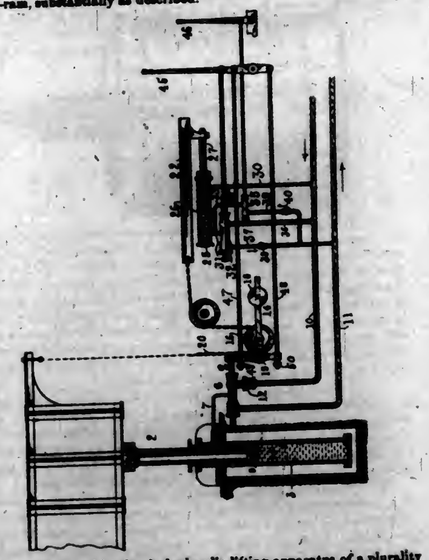
3. In a bicycle-brake, the combination, of a steering-fork provided near the lower end of the steering-post with a cross-bar or projection that is formed with a screw-threaded orifice, a bracket formed with a circular projection fitting the bore of the steering-post, a marginal flange surrounding said projection and rearwardly-projecting pivot-ears, a spring formed with an attaching-eye fitting the circular projection of the bracket, and with a loop portion encircling the pivot-ears of said bracket, with its free end bearing on the under surface of the brake-shoe forward of its pivotal attachment, a brake-shoe of a curved-plate formation pivoted to the pivot-ears of the bracket, and extending forward between the fork sides, and an attaching-bolt passing through the bracket and screwing into the screw-threaded orifice in the cross-bar or projection of the steering-fork, the marginal flange of the bracket, and the attaching-eye of the spring having a convex form in a transverse direction, substantially as set forth.

604,863. ARTIFICIAL TOOTH FOR CROWN AND BRIDGE WORK. FRANCIS H. BROWN, Chicago, Ill. Filed July 7, 1896. Serial No. 598,265. (No model.)

Claim.—1. An artificial tooth of a contour approximately that of the natural tooth and having its approximal and palatine surfaces provided below the cusp with a shallow depression bounded by vertical and horizontal shoulders, said depression being of a depth suitable to receive a metal backing and a pronged anchor embedded within the tooth and having the exposed ends of the pins or prongs thereof extending from the depressed portion of the body of the tooth and adapted to penetrate the backing and to be bent down thereon, substantially as described.

2. An artificial tooth of the contour approximately that of the natural tooth and having its approximal and palatine surfaces provided below the cusp with a depression bounded by vertical and horizontal shoulders, said depression being of such depth as to receive a suitable backing, an anchor embedded within the body of the tooth and having pins or prongs projecting from the depressed portion and a backing secured in said depressed portion by said pins, substantially as described.

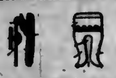
604,864. HYDRAULIC LIFT. THOMAS H. BROWN, New York, N. Y. Filed June 14, 1897. Serial No. 640,791. (No model.)



Claim.—1. The combination with a platform, a hydraulic motor for lifting the same, and a valve for controlling the motor, of a tensional connection operatively connected with said platform and adapted to throw said valve to various degrees of opening, and an auxiliary motor for actuating said connection, substantially as described.

2. The combination with a platform, a hydraulic motor for lifting the same, and a valve for controlling the motor, of a reciprocating tensional connection operatively connected with said platform and adapted to actuate said valve, and an auxiliary motor for actuating said tensional connection, substantially as described.

3. The combination of a platform, a plurality of lifting hydraulic motors and valves therefor, a plurality of tensional connections each operatively connected with said platform and adapted to independently actuate each valve, and an auxiliary motor adapted to actuate said tensional connections, substantially as described.



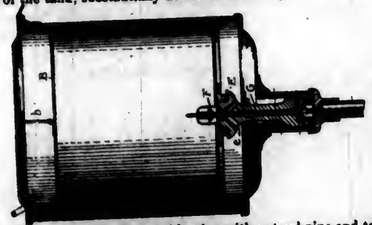
4. The combination in hydraulic lifting apparatus, of a platform, a plurality of hydraulic lifting-rams operatively connected therewith, a main operating-valve for each ram, a pilot-ram and tensional connections operatively connecting the pilot-ram with said platform and each of said main operating-valves, whereby each of said lifting-rams is required to move the same distance proportionally to the movement of the pilot-ram, substantially as described.

5. The combination in hydraulic lifting apparatus, of a platform, a plurality of hydraulic lifting-rams operatively connected therewith, a main operating-valve for each ram, a lever for throwing said valves, a pilot-ram and tensional devices from said pilot-ram to each of said levers and said platform, whereby each of said lifting-rams is required to move the same distance proportionally to the movement of said pilot-ram, substantially as described.

6. The combination in hydraulic lifting apparatus of a plurality of hydraulic lifting-rams, a main operating-valve for each ram, a pilot-ram controlled by the operator, a tensional connection from said pilot-ram to each main operating-valve and an auxiliary valve in the exhaust connection from said pilot-ram, also controlled by the operator and adapted to establish communication between the said last-mentioned valve and the exhaust when desired, substantially as described.

604,865. NECKTIE-FASTENER. HENRY W. BUEHLER, Brooklyn, N. Y. Filed June 16, 1897. Serial No. 640,977. (No model.)

Claim.—1. The herein-described means for connecting a necktie or bow with a collar-button, said means consisting of a device which is adapted to be connected with said button, and which consists of a plate the upper end of which is bent forwardly, downwardly and outwardly to form a loop, and the lower end of which is provided with a longitudinal slot, and a device connected with the back of said tie which is adapted to engage with said loop, substantially as shown and described.



2. In a fastening device for securing a necktie or bow to a collar-button, a plate formed of spring metal, the upper end of which is bent forwardly, downwardly and upwardly to form a loop and the lower end of which is provided with a longitudinal slot forming spring-prongs which are adapted to engage the shank of a collar-button, substantially as and for the purpose set forth.

604,866. VAPOR-STOVE. HARRY C. CAMPBELL, Lost, Pa., assignor to the Standard Oil Company of New York, New York, N. Y. Filed Oct. 14, 1897. Serial No. 655,103. (No model.)

Claim.—1. In vapor-stoves, the combination with a stand-pipe and tank, of a cylinder connected with the stand-pipe and tank, a plunger provided with an upwardly-opening check-valve working in said cylinder and acting to withdraw the gasolene from the stand-pipe, means for holding said check-valve positively open in its lowered position, and a connection between said plunger and a part which is moved as a condition precedent to the filling of the tank, substantially as set forth.

2. In vapor-stoves, the combination with a stand-pipe and tank, of a cylinder connected with the stand-pipe and tank, a plunger pro-

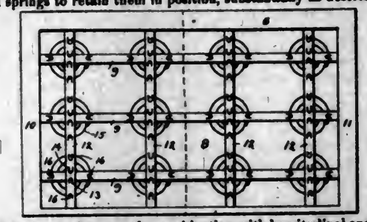
vided with an upwardly-opening check-valve working in said cylinder and acting to withdraw the gasolene from the stand-pipe, a coupling at the lower end of said cylinder with which the stem of said check-valve engages whereby the check-valve will be maintained positively opened in its lowered position, and a connection between said plunger and a part which is moved as a condition precedent to the filling of the tank, substantially as set forth.

3. In vapor-stoves, the combination with a stand-pipe and tank, of a reservoir or can within the tank, a plunger connected to said reservoir or can and acting by its movement to withdraw the gasolene from the stand-pipe and carried by said interior reservoir, whereby the withdrawal of the reservoir from the tank will cause the plunger to withdraw gasolene from the stand-pipe and extinguish the flame at the burner, an upwardly-opening check-valve for opening a passage through the plunger when the parts are in the normal condition of rest, and means for holding said check-valve positively open in its lowered position, substantially as set forth.

4. In vapor-stoves, the combination with a stand-pipe and tank, of a cylinder between the stand-pipe and tank, a reservoir or can within the tank, a check-valve in the bottom of the reservoir, a plunger and check-valve carried by the interior reservoir and moving in said cylinder, and means for opening both check-valves when the reservoir is inserted in the tank, substantially as set forth.

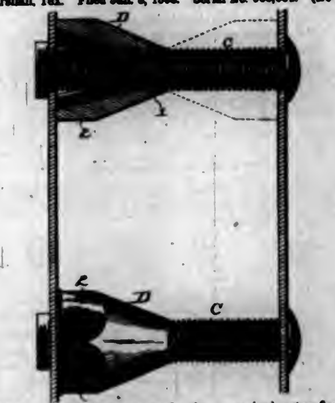
5. In vapor-stoves, the combination with a stand-pipe and tank, of a cylinder between the stand-pipe and tank, a reservoir or can within the tank having a filling-plug with a check-valve, in its bottom, an extension from said filling-plug carrying a plunger and check-valve at its lower end working in said cylinder, and a valve-stem for opening both check-valves which strikes an obstruction at the lower end of said cylinder and opens the check-valves when the interior reservoir reaches its position of rest in the tank, substantially as set forth.

604,367. OVERSHOE. LUTE E. CAMPBELL, Arkansas City, Kans. Filed May 26, 1897. Serial No. 638,258. (No model.)



Claim.—An overshoe having a reinforcement extending continuously around the heel portion on the inner face thereof and forming a shoulder to engage the upper edge of the counter of a shoe, said reinforcement consisting of the connecting portion 7 and the convex enlargements 6, located at the terminals of the portion 7 and adapted to engage the shoe opposite the hollows in the foot of the wearer, between the heel and the ankle, said convex enlargements 6 being tapered from their centers to their outer ends and to the terminals of the portion 7 and gradually decreasing in thickness above the shoulder at their bottoms or lower edges to the upper edges of the overshoe, whereby the upper edges of the overshoe will fit closely to the inner shoe and exclude water and slush, substantially as described.

604,368. SPRING-SEAT. JAMES H. CLOYES, Chicago, Ill., assignor to the Staver Carriage Company, same place. Filed Dec. 27, 1897. Serial No. 663,443. (No model.)

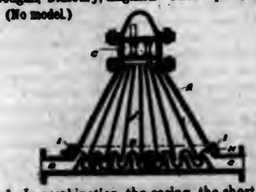


Claim.—1. In a spring-seat, the combination with longitudinal and transverse strips, of tongues projecting from one of said strips and overlapping the other to hold said strips together, and springs supported by said strips, substantially as described.

2. In a spring-seat, the combination with longitudinal and transverse strips, of tongues projecting from one of said strips and overlapping the other to hold said strips together, springs supported by said strips, and tongues projecting from said strips and overlapping said springs to retain them in position, substantially as described.

3. In a spring-seat, the combination with longitudinal and transverse strips, of tongues projecting from one of said strips and overlapping the other to hold said strips together, notches in the overlapped strips, which receive said tongues, and springs supported by said strips, substantially as described.

604,369. PROTECTOR FOR STAY-BOLTS. PEARCE J. COBB, Marshall, Tex. Filed Jan. 8, 1898. Serial No. 666,061. (No model.)

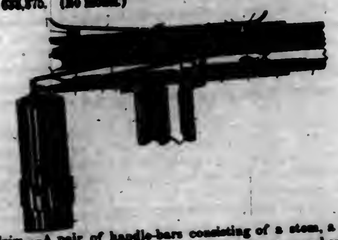


Claim.—1. A bolt-protector having a conical outer face, a conical inner face, a screw-threaded opening communicating at one end with the conical interior of the protector and terminating at the other end coincident with the end of the conical outer face, the larger end of the protector being adapted to bear against a boiler-plate and having flat peripheral faces to receive a wrench, substantially as set forth.

2. The combination with two shells of a boiler, of screw-threaded bolts connecting said shells, and conical protectors on said bolts, one end of each protector bearing against the inner face of the outer shell and the other end of said protector terminating intermediate of the end of the bolt on which it is screwed, substantially as set forth.

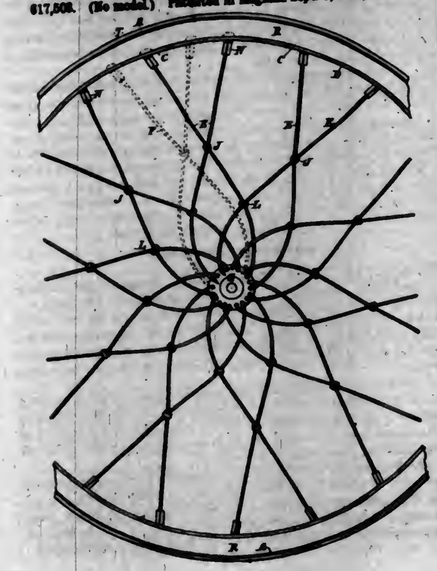
3. The combination with the shell of a fire-chamber and an outer shell with an intervening water-space between said shells, of bolts passing through said shells and the water-space, each bolt having a screw-threaded portion, a conical protector adapted to screw at its smaller end on each bolt so as to terminate between the ends of said bolt and each protector being adapted to bear tightly against the inner face of the outer shell, substantially as set forth.

604,870. OIL-EXTRACTOR AND FEED-WATER PURIFIER AND HEATER. ARTHUR COLLIER, Goole, England, assignor to Isaac Shimwell McDougall, Didsbury, England. Filed Apr. 1, 1896. Serial No. 676,111. (No model.)



Claim.—1. In combination the casing, the short partitions, the long partitions providing a circuitous passage for the water, and a heating-pipe in the casing and in the path of the water, substantially as described.

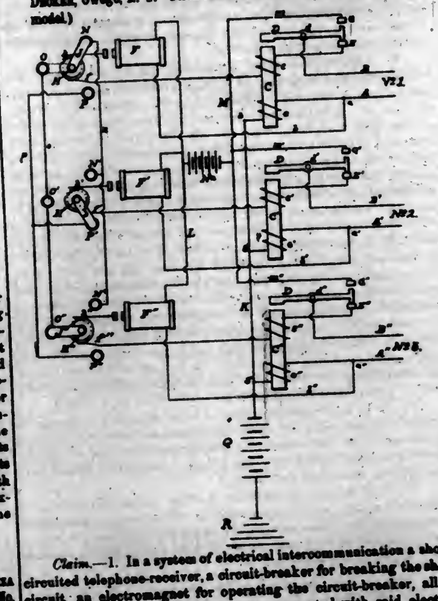
2. In combination, the casing, the series of short partitions extending up from the bottom thereof, a series of long partitions converging upwardly, said casing having a collecting-chamber for the oil and grease at its upper part, and the heating-pipe at the lower part of the casing, substantially as described.



3. In combination, the casing having the short partitions extending up therefrom, the longer partitions extending up in line with the spaces between the short partitions, the heater-pipe, the said casing having discharge-openings in its bottom for the sediment and the perforated grating L with means for adjusting the same to open or close the said discharge-openings, substantially as described.

604,871. COLLAPSIBLE AND ADJUSTABLE BICYCLE-HANDLE. WILLIAM H. COOK, Ironwood, Mich. Filed June 1, 1897. Serial No. 638,575. (No model.)

Claim.—A pair of handle-bars consisting of a stem, a tubular head secured at its center to the upper end of the stem and extending at right angles thereto, teeth formed at the ends of the head, a double-ended spring secured near the center of the head, lugs secured at each end of the spring and projecting through openings in the head to the interior thereof, the portion of the spring beyond the lugs being turned up to form finger-holds, two handle-bars having their inner ends adapted to fit in the head, each of said handles having a number of openings formed thereabout in that portion fitting within the head, registering with the opening through which the lug projects crown-rings secured on each handle-bar a suitable distance from its inner end, said ring being notched to form teeth to intermesh with the teeth formed at the ends of the head, a loop formed with and extending across the end of each handle-bar and a link connecting the loops, as and for the purpose described.



604,872. VEHICLE-WHEEL. WILLIAM G. CROMLEY and ELIZA A. CROMLEY, Auckland, New Zealand. Filed Dec. 30, 1896. Serial No. 617,503. (No model.) Patented in England Sept. 3, 1896, No. 19,660.

Claim.—1 In combination the rim, the convolute spring B, the waved spoke-rings C, D, arranged side by side with their waves alternating and filling in the waves of the spring B, and the spokes connected with the spoke-rings, substantially as described.

2. In a metallic wheel for cycles, and for other purposes, the combination with a series of twin spokes as hereinbefore described, of a rim consisting of an outer rim A, fluted or corrugated circumferentially, a fluted convoluted spring B, and two waved spoke-rings C and D, constructed, arranged, and held together as hereinbefore described, and set forth.

604,873. AUTOMATIC TELEPHONE-EXCHANGE. WARD DENKER, Owego, N. Y. Filed Mar. 26, 1895. Serial No. 543,122. (No model.)

Claim.—1. In a system of electrical intercommunication a short-circuited telephone-receiver, a circuit-breaker for breaking the short circuit, an electromagnet for operating the circuit-breaker, all in combination with a calling-generator connected with said electromagnet, whereby the short circuit is broken on operating the calling-generator.

2. In a system of electrical intercommunication, the combination of a calling-generator, a short-circuited telephone-receiver, a polarized electromagnet in circuit with the calling-generator for the purpose of breaking the short circuit on operating the generator.

3. In an automatic telephone or other electrical exchange, the combination of a calling-generator, a telephone-receiver, a short circuit around the latter adapted to be opened and closed by the armature of a polarized electromagnet in circuit with, and operated by, the calling-generator.

4. In an automatic telephone or other electrical exchange an armature free to move between two points, a polarized electromagnet on one side of said armature normally holding it against one point, means for releasing the armature from the influence of the electromagnet, all in combination with a permanent magnet on the other side of said armature of such strength as to draw the armature against the other point and hold it there despite further action of the electromagnet.

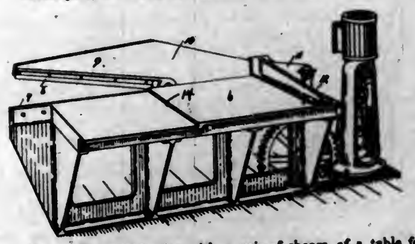
5. In a system of electrical intercommunication a short-circuited telephone-receiver, an electromagnet in circuit with the calling-generator for breaking the short circuit on operating the generator, all in combination with a switch for throwing the electromagnet out of circuit when the latter circuit is used for telephonic purposes.

6. In an automatic telephone or other electrical exchange, a short-circuited telephone-receiver, a polarized electromagnet for breaking the short circuit, a switch for throwing the polarized electromagnet out of the telephone-circuit and means for automatically restoring the short circuit.

7. In an automatic telephone or other electrical exchange system differential magnets included in but inoperative over a metallic circuit, an electromagnetic switching device for connecting said metallic circuit with other circuits, means for operating said differential

magnets over one side of the metallic circuit and suitable return, a switch controlled by the differential magnets and adapted to bring the electromagnetic switching device into the metallic circuit, all in combination with suitable means for operating the last-named switching device over the metallic circuit.

8. In an automatic telephone or other electrical exchange system, a metallic circuit with one side grounded, a switch-operating magnet in the metallic circuit and a switch-operating magnet in the grounded circuit for throwing the aforesaid magnet into action.



9. In an automatic telephone or other electrical exchange system comprising metallic circuits converging at a central station and one side of each metallic circuit permanently connected together and to a common ground or return at said central station, electromagnets adapted to be operated over one side of the metallic circuit to bring into the metallic circuit a second set of electromagnets, operating the last-named magnets over the metallic circuit to connect the free side of said metallic circuit with the free side or sides of other metallic circuits, substantially as described.

10. A system of electrical intercommunication consisting of metallic circuits extending from substations to a central station; one side of each metallic circuit being connected at the central station through one half of a differential electromagnet to the corresponding side of all the other metallic circuits and also through a battery or other source of electricity to a return-circuit; the other side of each metallic circuit at the central station being connected through a circuit-breaker operated by said differential electromagnet, and through the remaining half of said differential electromagnet and terminating in a switch; mechanism at the respective substations and central station whereby a current may be sent over one side of a metallic circuit and half of the differential magnet, thereby operating the circuit-breaker and breaking the circuit on the other side and at the same time bringing into the metallic circuit another electromagnet together with a battery or other source of electricity, whereby, by means of the second electromagnet and currents sent over the metallic circuit the said metallic circuit may, by the switch before mentioned be placed in electrical connection with one or more other metallic circuits, and by breaking the circuit of the first-named current restore the other side of the differential magnet to the metallic circuit and remove the switching-magnet.

11. In an automatic telephone or other electrical exchange, a transmitting instrument for operating the central-station switchboard consisting of the combination of a backward-and-forward moving intermittent circuit-breaker 31, the trigger 7, arm 6 and pin 49 substantially as shown and described.

12. In an automatic telephone or other electrical exchange, a transmitting instrument for operating the central-station switchboard consisting of the rotary axle 48, the plates 8 and 5, arm 6, trigger 7 and contact 11 all in combination with the stops 12 and 13 substantially as shown and described.

604,874. DOUBLING-SHEARS. FRANK DOWNER, Anderson, Ind. Filed Sept. 3, 1897. Serial No. 650,623. (No model.)

Claim.—The combination with a pair of shears, of a table for supporting the material to be sheared, the said table having one end thereof in a plane lower than the other thus forming a shoulder against which the material to be sheared may be held and presented to the shears.

604,875. WRENCH. JAMES K. DOWNER, Valley River, Canada. Filed Aug. 10, 1897. Serial No. 647,763. (No model.)

Claim.—1. In a monkey-wrench, the combination of the flat hollow handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the jaw I, having the flat rack-bar G, adapted to slide guidingly in said handle, the worm-screw F, placed in the aperture D, and engaging the rack-bar G, the screw E, inserted from the front of the lug C, and serving as a journal for the worm-screw to revolve upon, substantially as and for the purpose set forth.

2. In a monkey-wrench, the combination of a flat hollow handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the jaw I, having the flat rack-bar G, adapted to slide guidingly in said handle, the worm-screw F, placed in the aperture D, and engaging the rack-bar G, the screw E, inserted from the front of the lug C, and serving as a journal for the worm-screw to revolve upon, said rack-bar having a solid portion on its rear end to prevent it from being accidentally extracted from the handle, substantially as and for the purpose set forth.

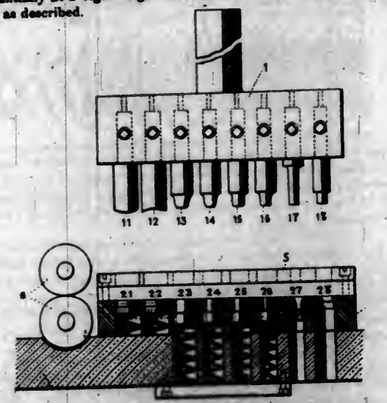
3. In a monkey-wrench, the combination of the flat hollow handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the jaw I, having the flat rack-bar G, adapted to slide guidingly in said handle, the worm-screw F, placed in the aperture D, and engaging the rack-bar F, the screw E, inserted from the front of the lug C, and serving as a journal for the worm-screw to revolve upon, said rack-bar being guided between the lug C, and the opposite narrow wall of the handle, substantially as and for the purpose set forth.

4. In a monkey-wrench, the combination of the flat hollow handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the jaw I, having the flat rack-bar G, adapted to slide guidingly in said handle, the worm-screw F, placed in the aperture D, and engaging the rack-bar F, the screw E, inserted from the front of the lug C, and serving as a journal for the worm-screw to revolve upon, said rack-bar being guided between the lug C, and the opposite narrow wall of the handle, and its rear end widened beyond the rack-bar so as to guide snugly between the narrow walls of the handle and to stop against the rear shoulder of the lug C, substantially as and for the purpose set forth.

5. In a monkey-wrench, the combination of the hollow flat handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the worm-screw F, placed in the aperture D, the screw E, inserted in the lug C, and serving as a journal for the worm-screw, the flat rack-bar G, adapted to be inserted through the rear end of the handle and engage with its teeth the worm-screw and having the combined guide and stop M, on its rear end, and the jaw I, secured upon its front end, and the strip L, closing the rear end of the handle substantially as and for the purpose set forth.

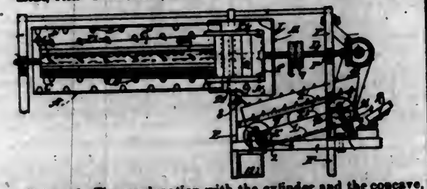
6. In a monkey-wrench, the combination of the hollow flat handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the worm-screw F, placed in the aperture D, the screw E, inserted in the lug C, and serving as a journal for the worm-screw, the flat rack-bar G, adapted to be inserted through the rear end of the handle and engage with its teeth the worm-screw and having the combined guide and stop M, on its rear end, and the jaw I, secured upon its front end, and the strip L, closing the rear end of the handle, all external corners of the wrench being rounded off, substantially as and for the purpose set forth.

7. In a monkey-wrench, the combination of the hollow flat handle A, having the jaw B, and inwardly-projecting lug C, with the aperture D, in it; the worm-screw F, placed in the aperture D, the screw E, inserted in the lug C, and serving as a journal for the worm-screw, the flat rack-bar G, adapted to be inserted through the rear end of the handle and engage with its teeth the worm-screw and having the combined guide and stop M, on its rear end, and the jaw I, secured upon its front end, and the strip L, closing the rear end of the handle all working and wearing parts of said wrench being made out of steel, substantially as and for the purpose set forth.



604,876. METAL-WORKING TOOL. FREDERICK ROSS, Bridgeport, Conn. Filed July 17, 1897. Serial No. 644,966. (No model.)

Claim.—1. In a reciprocating tool for simultaneously performing a series of operations on a strip of metal or the like, means, substantially as described, for incising the metal so as to partially detach from the strip a portion of metal larger than the base of the finished article.

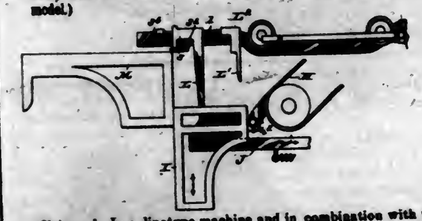


2. In a tool for simultaneously performing a series of operations on a strip of metal or the like a reciprocating cutting-die adapted to produce a plurality of incisions in the metal whereby a portion of metal larger than the base of the finished article is partially detached from the strip, substantially as described.

3. In a tool for simultaneously performing a series of operations on a strip of metal or the like a plurality of reciprocating cutting-dies each adapted to produce an incision, one or more, in the metal whereby a portion of metal larger than the base of the finished article is partially detached from the strip, substantially as described.

4. In a tool for simultaneously performing a series of operations on a strip of metal or the like two reciprocating cutting-dies each adapted to produce a pair of opposite curved incisions in the metal the chords of the curves of the second pair of said incisions being substantially at a right angle with those of the first pair, substantially as described.

604,877. PEA-SHELLING MACHINE. JOHN H. RHYNER, Longmont, Colo. Filed Feb. 4, 1897. Serial No. 621,978. (No model.)

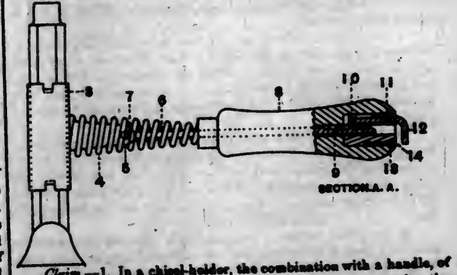


Claim.—1. The combination with the cylinder and the concave, of a beater comprising a short piece of right-angled angle-iron having a rubber thimble secured to its vertically-disposed limb, channel-shaped washers secured to the threshing-cylinder or to the concave adapted for the said beaters to rest on, a hole through the center of said washer and a like hole on each side of it, a hole through the central portion of the opposite limb of said angle-iron beater and a concentric slot on each side of it arranged to register with the holes in said channel-shaped washer, and bolts, having their heads confined in the channel of said washer and projecting through the holes of said washer through the slots of said angle-iron whereby the said beater may be secured to said washer and adjusted on it at various angles to said washer and to the longitudinal axis of said threshing-cylinder, substantially as described.

2. The combination with the cylinder and the concave, of two crank-shafts having a plurality of oppositely-disposed cranks, troughs having a centrally-depending rib pivoted at each end to each similar disposed crank of each shaft and inclined upward away from said cylinder and positioned with their lower ends below and opposite the discharge-outlet of said cylinder and concave, and having their lower ends open and their upper ends closed, a plurality of right-angular-shaped strips secured transversely across the top of each trough at a space apart sufficient to allow the peas in the vines to drop between them into said trough, and positioned with one of the sides of the right angle toward the highest end of said troughs, with a bevel-gear on the end of said driving-shaft, a shaft journaled transversely to said driving shaft, a bevel-gear thereon meshing with said first-named bevel-gear, suitable belt and pulley connections between said transverse shaft and one of said crank-shafts, and between the said crank-shafts, whereby they are caused to rotate with their cranks moving in unison and a portion of said troughs are thereby carried uniformly upward and the remainder uniformly downward in alternate order, substantially as described.

3. The combination with the cylinder and the concave, of a right-angle-shaped beater having a rubber-covered beating end, a bolt-hole through the center of its opposite end and a slot on each side of said hole and concentric to it, with a foundation-washer for said beater consisting of a channel-shaped member having its ends turned outward at approximately right angles to its sides and curved to fit and rest on the surface of said cylinder at an angle to its longitudinal axis, a centrally-arranged bolt-hole through its top registering with the center hole of said beaters, and similar bolt-holes on each side of said center bolt-hole registering with the slots in said beater and bolts adapted to said holes and slots, whereby said beater may be adjustably secured at any desired angle relative to said cylinder's axis on said washer, substantially as described.

604,878. LINOTYPE-MACHINE. LOUIS PFAHLER and EDWARD W. REYNOLDS, Brooklyn, N. Y., assignors to the Mergenthaler Linotype Company, of New Jersey. Filed Mar. 6, 1896. Serial No. 581,891. (No model.)



Claim.—1. In a linotype-machine and in combination with the assembling-elevator I, the sliding transfer-carriage provided with a rigid arm L', and the longer yielding arm L.

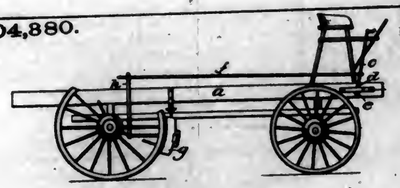
2. In a linotype-machine in combination with the assembling-elevator and the assembling-slide J, the transfer-carriage L^2 provided with a depending arm L', the sliding arm L, the spring acting on the arm L and an adjustable collar or support for said spring.

3. As an improvement in linotype-machines, a transfer-carriage L^2, provided with an arm or bar *l* and depending arm L', the sliding arm L, the spring *s*, collar s^3, and latch s^5.

604,879. CHISEL-HOLDER. JOHN J. FLYNN, Warren, Minn. Filed Oct. 12, 1897. Serial No. 654,962. (No model.)

Claim.—1. In a chisel-holder, the combination with a handle, of a rod extending from one end of the handle, means for securing the rod, a pair of jaws provided with tapering extensions movably connected to the extremity of the rod, and a spiral spring encircling the jaw extensions and the rod intermediate of the jaws and handle, substantially as specified.

2. In a chisel-holder, the combination with a handle, of a longitudinally-movable rod carried thereby, means for securing the rod, a pair of jaws provided with tapering extensions connected to the extremity of the rod, and a spring intermediate of the handle and jaws and encircling the tapering extension and the rod, substantially as specified.



3. In a chisel-holder, the combination with a handle, of a longitudinally-movable rod carried thereby, a latch extending from the rear end of the handle and in operative relation to the rod, a pair of jaws provided with conical extensions connected to one extremity of the rod, and a tapering spring intermediate of the handle and jaws and encircling the tapering extensions and the rod, substantially as specified.

4. The combination of the jaws 3 provided with the tapering connections 5, the spring 4, the rod 6, provided with the notched portion 9, the bushing 14 and the spring-latch 10, substantially as shown.

604,880. WAGON-BRAKE. DUANE A. FOSTER, Santa Rosa, Cal. Filed Oct. 31, 1896. Serial No. 610,778. (No model.)

Claim.—A fulcrum-bar for wagon-brakes provided with two or more notches in combination a brake-lever having a tooth for engagement with the notches and capable of being shifted from one notch to another in the manner described.

604,880.

604,881. WITHDRAWN.

604,882. LAST. EDWIN L. GODING, Portland, Me. Filed Mar. 22, 1895. Serial No. 542,743. (No model.)

Claim.—1. A divided last consisting of a fore part, a heel, and an intermediate section, the lateral surfaces of which are unsymmetrical with said fore part and heel when the several parts are placed adjacent to each other, substantially as and for the purposes set forth.

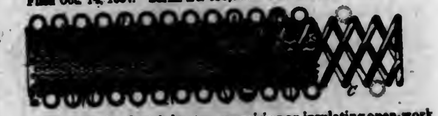
2. A divided last consisting of a fore part, a heel, and an intermediate section hinged to said heel, the lateral surfaces of said intermediate section being unsymmetrical with said fore part and heel when the several parts are placed adjacent to each other, substantially as and for the purposes set forth.

3. A divided last consisting of a fore part, a heel and an unsymmetrical intermediate section hinged to said heel, the top of said intermediate section being inclined downwardly toward the heel to permit said heel to be turned on said hinge, substantially as and for the purposes set forth.

4. As a new article of manufacture, a last-heel formed in two sections hinged together, the adjacent faces being cut away at the top, the forward section varying from the symmetrical outline of the last by being reduced in size to adapt it to be used with fore parts of lasts of different styles and sizes, substantially as and for the purposes set forth.

5. As a new article of manufacture, a universal last-heel divided at a point at or near the instep and having its forward end reduced in size from the symmetrical outlines of the last, said forward end being adapted to engage the upright end of the fore parts of lasts of different styles and sizes, substantially as and for the purposes set forth.

6. As a new article of manufacture a last-heel adapted to be used with lasts of different styles and sizes consisting of two parts, a heel proper and a brace hinged thereto and adapted to engage the rear end of the fore part of the last when these said parts are inserted in a shoe the size of said brace being in cross-section smaller than the adjacent edge of the fore part of the last, substantially as and for the purposes set forth.

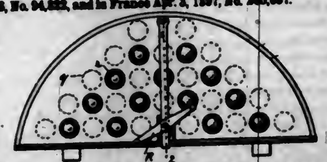


604,883. LAST. EDWIN L. GODING, Portland, Me. Filed Aug. 14, 1896. Serial No. 602,708. (No model.)

Claim.—1. As a new article of manufacture a fore part of a last provided with a vertical socket in its rear wall and a transverse bar set in said fore part and extending across said socket, in combination with a heel part provided with a projecting connecting-plate, said plate being adapted to project into the socket in the fore part and adapted to removably engage and pivot on said bar, substantially as and for the purposes set forth.

2. In a last, the combination with a fore part provided with a vertical socket in its rear wall and a transverse bar set in said fore part and extending across said socket, of a heel part provided with a connecting-plate having a hook on the end adapted to engage the bar in the fore part and swing thereon and a spring adapted to serve as a closure for said hook, substantially as and for the purposes set forth.

604,884. ELECTRIC HEATER. EDWARD R. GOLD, New York, N. Y. Filed Oct. 14, 1897. Serial No. 655,176. (No model.)



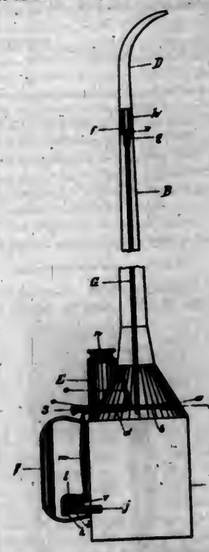
Claim.—1. An electric heater comprising an insulating open-work support consisting of a thin foraminous tube, and a helix of resistant wire wound helically around said support, whereby air may circulate between the meshes of said helix and through the openings into and out of the interior of said support and into contact with all portions of the heated resistance wire.

2. An electric heater comprising an insulating open-work support of thin foraminous metal in the general form of a hollow cylinder, coated with insulating-enamel, and a helix of resistant wire wound helically around said support, whereby air may circulate between the meshes of said helix and through the openings into and out of the interior of said support and into contact with all portions of the heated resistance wire.

3. An electric heater comprising a hollow open-work support in the general form of a hollow cylinder, having projections winding helically around it, and a helix of resistant wire wound helically around said support parallel with and between said projections, whereby said projections serve to separate the successive windings of resistant wire, and the openings in said support permit circulation of air into and out of the interior thereof and into contact with all portions of the helix.

4. An electric heater comprising an insulating open-work support consisting of a thin foraminous tube, an enameled wire wound helically around said support, and a helix of resistant wire wound helically around said support in the spaces between the parallel convolutions of said enameled wire, whereby the resistant wire is supported by said support and its parallel windings are separated by said enameled wire.

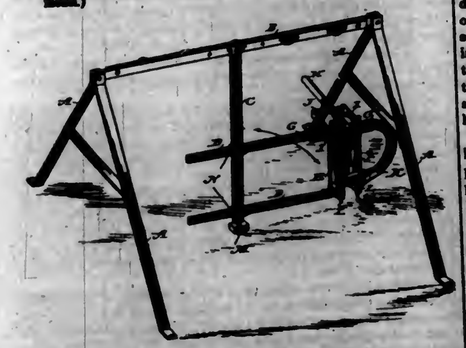
604,885. DEVICE FOR ADMITTING AIR TO FURNACES. RICHARD GOLL, Frankfort-on-the-Main, Germany. Filed Dec. 20, 1897. Serial No. 664,358. (No model.) Patented in Switzerland Nov. 20, 1896, No. 17,136; in Hungary Dec. 2, 1896, No. 17,623; in Germany Dec. 24, 1896, No. 94,822, and in France Apr. 3, 1897, No. 265,637.



Claim.—1. In a device for regulating the admission of air and the like, the combination of two perforated plates, one of which plates is movable toward and from the other plate, a boss projecting from the surface of one plate, placed opposite the opening in the other plate, and decreasing in thickness toward the opening.

2. In a device for regulating admission of air and the like, the combination of two plates having series of openings, and bosses on one plate opposite openings in the other plate, said bosses projecting from the normal surface of their plate.

3. The combination of two plates one having openings, and bosses projecting from the surface of the plate, the other plate being perforated opposite the bosses, one plate being movable toward and from the other plate.



604,886. OIL-CAN. WESLEY R. GOODWIN, Indianapolis, Ind. Filed Mar. 26, 1896. Renewed Apr. 3, 1897. Serial No. 630,690. (No model.)

Claim.—1. The combination in a hand oil-can, having a threaded collar *f*, within the upper end of its spout B, and a like-threaded nipple A, having a valve-seat *o* on the end thereof entering the interior of the collar *f*, of the oil-outlet-regulating mechanism, consisting of the crank-shaft *b*, the socket-bearing *c*, the open bearing *d'*, the packing-ring *d*, on the end of the bearing *d'*, the thumb-lever *e*, the coil-spring *e*, and the valve-rod G, having the valve-point *g*, with the air-inlet mechanism located within the handle F, consisting of the tube *i*, having an air-opening *j*, said opening normally closed by a rubber valve *k*, said valve attached to the lever *l*, pivotally mounted on the tube *i*, and normally held against the opening *j* by means of a U-spring *v*, resting between the tube *i*, and lever *l*, and a rod *m*, secured to the lever *l*, and extending upwardly and terminating at a point just below the thumb-lever *e*, all as set forth.

2. In a hand oil-can of the class described, having a detachable nozzle, an oil-outlet valve, a crank-shaft journaled within the can, the inner end within a socket-bearing, and the projecting end within a tube-like bearing, having a packing-ring at its outer end, said crank-shaft provided with a thumb-lever at its outer end, a valve-rod actuated by the crank-shaft, a coil spring secured to the can and to the crank-shaft, for the purpose of normally lifting the cranked portion of the crank-shaft, the combination of an air-inlet tube *i*, located near the lower part of the can within the handle F, having the opening *j*, which is normally closed by a rubber valve *k*, attached to the pivoted lever *l*, on the tube *i*, said closure being effected by the U-spring *v*, placed between the tube *i* and the upper end of the lever *l*, said lever *l*, pivotally attached to a rod *m*, extending upwardly and terminating just below the thumb-lever *e*, on the crank-shaft *b*, as shown and described.

604,887. GROUT WATER-TANK MACHINE. FRANK R. GREGORY, Victor, Mich. Filed Mar. 31, 1896. Serial No. 584,857. (No model.)

Claim.—A machine for forming grout tanks having the combination of standards A, adjustable cross-beam B, vertical shaft C having its upper end journaled therein and its lower end supported, horizontal arms D secured to the shaft C, shapers E and F secured at their lower ends to the free ends of the arms D and their upper ends adjustably controlled substantially as described.

604,888. SHIPPING BOX OR CRATE. EDGAR H. HAMILTON, Berlin, Conn. Filed Nov. 16, 1897. Serial No. 658,755. (No model.)

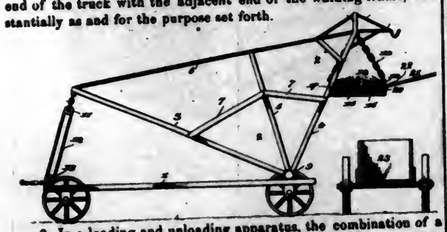
Claim.—1. A packing-box having vertical slots formed in its sides, horizontal slots leading therefrom and notches formed in the horizontal slots, partitions adapted to pass through the vertical slots, said partitions having tenons thereon for fitting in the notches, as and for the purpose set forth.

2. In combination, a box having vertical slots, horizontal slots leading therefrom and notches formed in said horizontal slots, partitions adapted to pass through the vertical slots, and tenons formed upon the partitions adapted to fit within said notches whereby the partitions will be held in various positions, as specified.

3. In combination, a box having its sides formed with vertical slots therein and horizontal slots leading from the first named, partitions adapted to pass through the vertical slots, tenons formed on the ends of said partitions adapted to fit within notches formed in the horizontal slots, said partitions being slotted and notched similarly to the sides, and cross-partitions having tenons similar to the first named to fit in the slots thereof, as and for the purpose described.

4. In a box having vertical slots formed in the sides thereof and horizontal slots leading therefrom, partitions adapted to be passed through the vertical slots, tenons on the ends of the partitions adapted to slide within the horizontal slots, and means for holding the partitions rigidly in position, substantially as described.

604,889. ADJUSTABLE HANDLE-BAR. JOHN L. HAMILTON, Jr., Hoopeston, Ill. Filed Nov. 19, 1896. Serial No. 612,760½. (No model.)

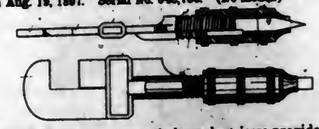


Claim.—1. In an adjustable handle-bar for bicycles or velocipedes, a handle-bar having a plurality of depressions or indentations for a portion of its length, a steering-post having a hollow cylindrical top portion, said cylindrical top portion being provided with one or more slots or openings, engaging devices adapted to ride in said slots or openings, an eccentric sleeve carried by and surrounding the cylindrical top portion of the steering-post and adapted, in the operation of adjustment of the said handle-bar, to force and bind the said engaging devices into the depressions or indentations in the said handle-bar, thereby locking and securely fastening the said handle-bar in the desired position of adjustment.

2. In an adjustable handle-bar for bicycles or velocipedes, a handle-bar having a plurality of depressions or indentations for a portion of its length, a steering-post having a hollow cylindrical top portion, one or more slots or openings, located in said cylindrical top portion, keys or pins riding in said slots or openings, a cylindrical sleeve carried by and surrounding the said cylindrical top portion of the steering-post, said cylindrical sleeve having one or more depressions, indentations, grooves or flutes located within its inner periphery, said depressions, indentations, grooves or flutes being capable of adjustment coincident with the position of the said keys or pins located within the said slots or openings in the cylindrical top portion of the steering-post, thereby supplying means for the proper displacement of the said keys or pins during the process of adjusting the handle-bar in the desired position.

604,890. LOADING OR UNLOADING MACHINE. JOSEPH I. HANSEN, Moville, Iowa. Filed Mar. 20, 1897. Serial No. 628,514. (No model.)

Claim.—1. In a loading and unloading apparatus, the combination of a trick, a walking-frame mounted upon one end of the truck and comprising similar side pieces which are connected together, each side piece comprising diverging beams and an intermediate brace, a tie-rod and braces connecting the diverging beams with the intermediate brace, and a block and tackle connecting the opposite end of the truck with the adjacent end of the walking-frame, substantially as and for the purpose set forth.



2. In a loading and unloading apparatus, the combination of a walking-frame, actuating mechanism therefor, hooked arms projecting from an end of the walking-frame, and struts and truss-braces for strengthening the hooked extremities of the said arms, substantially as set forth for the purpose described.

3. In a loading and unloading apparatus, the combination with the hoisting mechanism, of a box for receiving the load, suspending means applied to the sides of the box, means for pivotally connecting the bottom of the box with a side, and detachable connections for uniting the opposite end of the bottom with the other side, substantially as set forth.

4. In a loading and unloading apparatus, the combination with the hoisting mechanism, of a box, slip connections between a side and the bottom of the box, and a lever having connection with the bottom and side for relatively moving them laterally so as to slip the said connections, whereby the bottom is released, substantially as and for the purpose set forth.

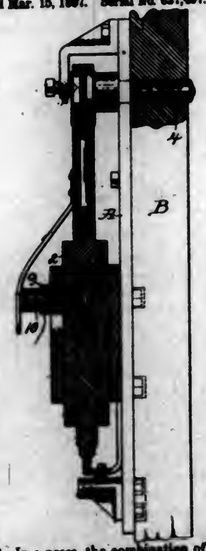
604,891. WRENCH. HENRY J. HANCOCK, New York, N. Y. Filed Aug. 19, 1897. Serial No. 648,780. (No model.)

Claim.—1. In a wrench, two independent jaws provided respectively with a screw-threaded shank, the threads on each shank being turned in the opposite direction to the other, and a revolubie cylinder adapted in coöperation with said shanks to reciprocate the jaws of the wrench in opposite directions simultaneously, substantially as described.

2. In a wrench, two independent jaws provided respectively with a screw-threaded shank, the threads on each shank being turned in the opposite direction to the other, and means in conjunction with said threads whereby the said jaws are simultaneously reciprocated in opposite directions, substantially as described.

3. In a wrench, an upper and a lower jaw provided respectively with a screw-threaded shank, the thread on each shank being turned in the opposite direction to the other, means in conjunction with said threads whereby said jaws are simultaneously reciprocated in opposite directions and means whereby the extent of such reciprocation is limited, substantially as described.

4. In a wrench, an upper and a lower jaw provided respectively with a screw threaded shank, the thread on each shank being turned in the opposite direction to the other, means in conjunction with said threads whereby said jaws are simultaneously reciprocated in opposite directions, and a check-screw secured to one of said shanks whereby the extent of such reciprocation is limited, substantially as described.



5. In a wrench, the combination with independent movable jaws provided respectively with a shank, having a screw-thread thereon and a bearing-surface adapted to abut against a corresponding bearing-surface of the other whereby longitudinal oscillation of the jaws is prevented, of means in conjunction with said screw-thread whereby said jaws are reciprocated, said threads being turned in opposite directions whereby said jaws will be reciprocated simultaneously in opposite directions, substantially as described.

6. In a wrench, two independent jaws provided respectively with a screw-threaded shank, the threads on each shank being turned in the opposite direction to the other, a revolubie cylinder, interior screw-threads thereon whereby in coöperation with the screw-threads on said shanks, said jaws are simultaneously reciprocated in opposite directions, and a screw-driver attached to one of said shanks and adapted to be drawn within said cylinders, substantially as described.

7. In a wrench, two independent jaws provided respectively with a screw-threaded shank, the screw-threads on each shank being turned in the opposite direction to the other, said shanks being provided with abutting bearing-surfaces whereby longitudinal oscillation of said jaws is prevented, and a revolubie cylinder having right and left screw-threads on the interior thereof whereby said jaws are simultaneously reciprocated in opposite directions, substantially as described.

8. In a wrench, an upper and a lower jaw provided respectively with a screw-threaded shank, the screw-threads on said shank being turned in opposite directions said shanks being provided respectively with a bearing-surface adapted to abut against a corresponding bearing-surface of the other, a cross bar having a guide-groove therein whereby said jaws are maintained in the proper relative position, and an interiorly-screw-threaded, revolubie cylinder, the threads therein being turned in opposite directions whereby said jaws are simultaneously reciprocated in opposite directions, substantially as described.

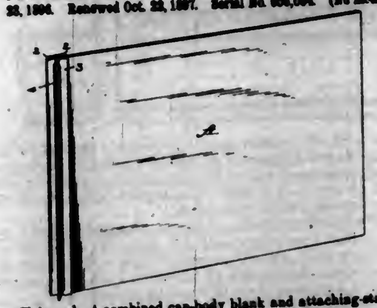
604,892. PUNCHING-PRESS. WILLIAM O. HOSABOOM, Everett, Mass. Filed Mar. 15, 1897. Serial No. 627,497. (No model.)

Claim.—1. In a press, the combination of a reciprocating plunger having a longitudinal bore, of means for retaining the punch in said bore, of a pin, and of a spring which normally holds said pin from projecting into said bore, said pin being adapted to be thrust between the upper end wall of said bore and the upper end of the punch.

2. In a press, the combination of a reciprocating punch, of a die-block, of an adjustable stripper, and of a gage carried by said stripper and adjustable thereon.

3. In a press, the combination of a back plate, of a stripper having vertically-slotted vertical arms, said stripper having its horizontal portion transversely slotted, of a plate, and of screws passing through said transverse slots, and securing said plate adjustably to said stripper.

4. In a press the combination of a back plate; of a block projecting therefrom, said block having a central bore and a slotted face; of a plunger made to reciprocate in said bore, said plunger carrying the pin which projects through the slot in the face of said block; of a punch carried by the plunger, said punch being thrown into operation by means of said pin



5. In a press the combination of a back plate; of a centrally-bored block projecting therefrom having a slotted face; of a reciprocating plunger provided with a punch; of a spring-pressed pin carried by the plunger and projecting through the slotted face of the block; and of a keeper to limit the outward movement of the pin.

604,893. DEVICE FOR ADMINISTERING MEDICINES. CHAS. C. HOOKER, Richmond, Ky. Filed Apr. 30, 1897. Serial No. 634,659. (No model.)

Claim.—The combination with the open-ended box, the hinged bottom, and the hollow handle, having a circular flange at the upper end, of the cup open at the lower end and top, the plunger secured thereto and formed with a ring at the upper end, substantially as described.

604,894. COMBINED BODY-BLANK AND CONNECTING-STRIP FOR PACKING-CANS. HENRY G. HUNTER, Alameda, Cal. Filed Jan. 23, 1896. Renewed Oct. 23, 1897. Serial No. 656,064. (No model.)

Claim.—1. A combined can-body blank and attaching-strip, the said strip having flanges clamped on one edge of the blank, and two flanges open to receive the other edge, substantially as described.

2. A body-blank for cans, comprising the sheet of material and an attaching-strip secured permanently to one edge thereof, said strip having the double flanges 2, 2, in the same plane, the flange 3 clamping the strip between itself and one double flange 2 and the flange 4 extending at an angle to the second double flange 2 to receive the free edge of the sheet when the same is bent to the form of the can-body.

604,895. CAR-FENDER. LYTLE J. HUNTER, Covington, Ky. Filed Mar. 19, 1896. Serial No. 584,013. (No model.)

Claim.—1. A car-front shield, made in elastic sections, separable, and capable of ready connection at their junction, and when in use, bent into a curved form and connected by a connection forming a chord of a circle, substantially as and for the purpose specified.

2. The shield made in two half-sections, capable of ready union and separation, the shield being connected above for oscillation, and having its lower outer ends connected by the chain, hooked to one of the sections and holding the same together below, substantially as and for the purposes specified.

3. A curved shield supported above on loose connections and below provided with link E^2, having pin E^3, interfitting arm E^4 and in combination with said arm E^4, and shaft E^5 thereof, for moving mechanism for dropping a fender below the car, and a connection across the shield for holding the pin E^3 in place in said arm E^4, substantially as and for the purposes specified.

4. A curved shield made in sections and suspended above at the car-front, each side section provided with a link E^2 and pin E^3 on the link, in combination with an arm E^4 receiving the pin E^3, a shaft E^5 of arm E^4, for moving the mechanism for operating the fender, and a chain connecting the outer end of each side of the shield with the other, and holding the links to the arms E^4, and the pins E^3 thereon, substantially as and for the purposes specified.

5. The combination of the horizontal fender and the shaft H thereof, and the tripping-rod I connected to the said shaft, and having rounded end I^3, and the bell-crank lever J, pivoted at J^3 and having arm J^5 and arm J^4, and rounded projection I^4, for engaging tripping-rod I, and lever K pivoted at K^3, and having arm K^5, provided with recess K^4, for receiving the end of lever-arm J^4, and connection L fixed at one end to arm K^5, substantially as and for the purpose specified.

6. The combination of the horizontal fender and the shaft H thereof, and the tripping-rod I connected to the said shaft, and having rounded end I^3, and the bell-crank lever J, pivoted at J^3 and having arm J^5 and arm J^4 and rounded projection I^4, for engaging tripping-rod I, and lever K pivoted at K^3, and having arm K^5, provided with recess K^4, for receiving the end of lever-arm J^4, and connection L and tripping-rod I in combination with a front trigger apparatus for moving the connection L, substantially as and for the purposes specified.

7. The combination of the horizontal fender and the shaft H thereof, and the tripping-rod I connected to the said shaft, and having rounded end I^3, and the bell-crank lever J, pivoted at J^3 and having arm J^5 and arm J^4 and rounded projection I^4, for engaging tripping-rod I, and lever K pivoted at K^3, and having arm K^5, provided with recess K^4, for receiving the end of lever-arm J^4, and connection L, and tripping-rod I, shaft H thereof, shield for operating through levers the said shaft, and lever M^4, and connection M^5, connected to connection L, and means for elastically returning the fender to place, substantially as and for the purposes specified.

8. The combination of the horizontal fender and the shaft H thereof, and the tripping-rod I connected to the said shaft, and having rounded end I^3, and the bell crank lever J, pivoted at J^3 and having arm J^5 and arm J^4 and rounded projection I^4, for engaging tripping-rod I, and lever K pivoted at K^3, and having arm K^5, provided with recess K^4, for receiving the end of lever-arm J^4, and connection L, and tripping-rod I, shaft H thereof, shield for operating through levers the said shaft, and treadle in platform, and lever M^6 and connection M^6 connected to connection L, and means for elastically returning the said treadle-shield and the said treadle to place, substantially as and for the purposes specified.

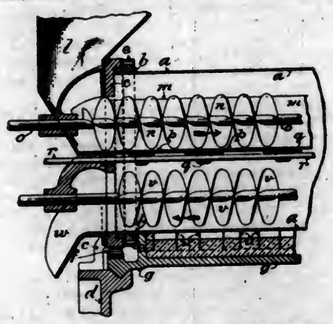
9. The combination of the fender, shaft H thereof, tripping-rod I fixed to shaft H, ratchet-piece N^2, pivoted to tripping-rod I and having weight N^3 and suspended pawl N, substantially as and for the purposes specified.

10. The combination of the fender, shaft H thereof, tripping-rod I fixed to shaft H, ratchet-piece N^2 pivoted to tripping-rod I and having weight N^3 and suspended pawl N, and pulley P^2, cord P thereof, connected at an end to ratchet-piece N^2, and at the other carried forward and above the platform, within reach of the operator, substantially as and for the purposes specified.

11. The combination of the horizontal fender, shaft H thereof, tripping-rod I thereon, and lever J, and latch K, interconnecting, and connection L for unlocking the latch, and pulley P^2, cord P thereof, duly connected to tripping-rod I, and carried above the platform, substantially as and for the purposes specified.

12. The combination of the horizontal fender, shaft H thereof, tripping-rod I thereon, and lever J, and latch-lever K, interconnecting, and connection L for unlocking the latch, and pulley P^2, cord P thereof, and ratchet-piece N^2, and pawl N, the cord being connected to said ratchet-piece, and at its other end carried above the platform, substantially as and for the purposes specified.

13. The combination of a connection L, an apparatus for operating the said connection, a fender and mechanism for dropping it, and a ratchet-wheel, on a shaft R^2, carrying a spring strained between same and another point as R^6, arm R^7, pawl R^8 thereof, and a connection R^9 connected to connection L, substantially as and for the purposes specified.



14. The combination of the operating connection L, and the fender, intermediate mechanism, consisting of tripping-rod I, for working the fender, and lever J^3, I^4, J^4, latch K^3, K^4, K^5, duly connected to connection L, ratchet-piece N^2, pawl N, and ratchet-wheel R, shaft R^2 thereof, spring R^4, arm R^7, pawl R^8 thereof for engaging the ratchet-wheel R, and a connection R^9 connected to connection L, substantially as and for the purposes specified.

15. The combination of the operating connection L, and the fender, intermediate mechanism, consisting of tripping-rod I for working the fender, and lever J^3, I^4, J^4, latch K^3, K^4, K^5, duly connected to connection L, ratchet-piece N^2, pawl N, and ratchet-wheel R, shaft R^2 thereof, spring R^4, arm R^7, pawl R^8 thereof for engaging the ratchet-wheel R, and a connection R^9 connected to connection L, and pulley P^2, and cord P duly connected to the tripping-rod I, and carried to the platform, substantially as and for the purposes specified.

16. The combination of the operating connection L, and the fender, intermediate mechanism, consisting of tripping-rod I for working the fender, and lever J^3, I^4, J^4, latch K^3, K^4, K^5, duly connected to connection L, ratchet-piece N^2, pawl N, and ratchet wheel R, shaft

R^3 thereof, spring R^5, arm R^7, pawl R^8 thereof for engaging the ratchet-wheel R, and a connection R^9 connected to connection L, and pulley P^2, and a cord P duly connected to the tripping-rod I, and carried to the platform, and the oscillatory shield carrying the links E, pivoted to arms for operating the shaft, arm L^2, duly connected to connection L, substantially as and for the purposes specified.

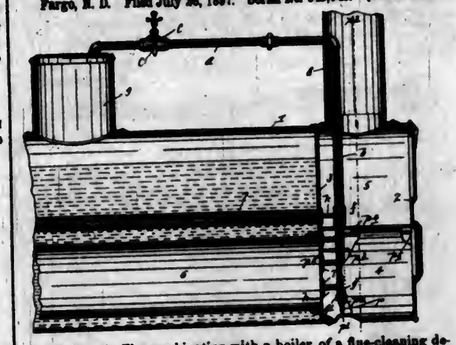
604,396. MACHINE FOR CHARGING LINOLEUM-MOLDS. JOHN INGLEBY, Leeds, England. Filed Feb. 25, 1897. Serial No. 624,951. (No model.) Patented in England June 27, 1895, No. 12,433.

Claim.—1. In mechanism for feeding the molds used in the manufacture of mosaic and inlaid linoleum or similar fabric, the combination with said molds, of a stencil having openings formed therein and movable with the said molds of means for conveying a stream of linoleum material along and over the said stencil and delivering the same thereto and means for conveying said material in an upper stream of reverse direction and delivering successively portions of such material from the upper stream to the lower substantially as set forth.

2. In combination with linoleum-molds and a rotating stencil having openings arranged to discharge into them, means arranged within the said stencil for feeding two streams of linoleum material in reverse directions and means for permitting the discharge of the material from the upper stream into the lower and from the lower stream on the discharging part of the stencil substantially as set forth.

3. In combination with a series of linoleum-molds and a longitudinally-movable support therefor, a rack carried by said support, a cylindrical stencil arranged above the said molds and provided with openings at intervals, a gear-wheel turning with the said stencil, means for feeding the linoleum material to the discharging part of the said stencil, and gearing interposed between the said rack and the gear-wheel first above mentioned, a part of this gearing having the same ratio of diameters as the stencil and its gear-wheel, for the purpose set forth.

4. In combination with a series of linoleum-molds and a stencil movable above them, two superposed troughs arranged above the discharging part of the said stencil, and conveyers operating respectively in the said troughs and in reverse directions, these troughs being provided with discharge-openings substantially as set forth.



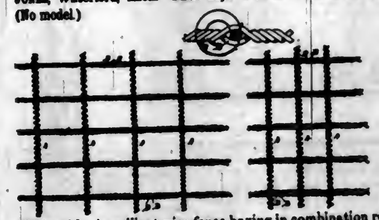
5. In combination with a series of linoleum-molds and a stencil movable above them, a pair of superposed troughs provided with downwardly-discharging openings arranged as described, a series of gates and an operating-rod controlling the openings of upper trough, and conveyers operating in reverse directions in said troughs substantially as set forth.

6. A series of molds, endwise movable collectively and a rack moving therewith, in combination with a cylindrical stencil, a gear-wheel thereon, gearing between the said rack and wheel, two troughs having outlets which are superposed within the said stencil but do not turn therewith, conveyers operating in said troughs to feed the material in reverse streams, and means for governing the outlets from the upper trough to the lower, substantially as set forth.

7. In combination with a stencil, molds supplied therethrough, a trough above the said stencil adapted to discharge thereon and a screw conveyer arranged within the said trough and adapted to maintain by simultaneous action on the material at several points a continuous movement of material lengthwise of the same substantially as set forth.

8. In combination with a stencil, molds supplied therethrough, and means for automatically maintaining, by simultaneous action on the material at several points, a continuous movement of material above the stencil, and permitting it to be discharged thereon substantially as set forth.

604,397. STEAM-BOILER-FLUE CLEANER. HENRY J. JOHNSON, Fargo, N. D. Filed July 26, 1897. Serial No. 645,943. (No model.)



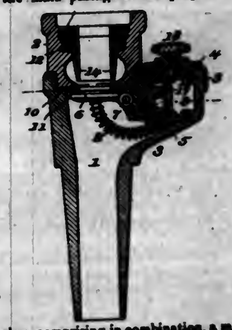
Claim.—1. The combination with a boiler, of a flue-cleaning device involving nozzled pipe-sections suspended within the smoke-box or similar compartment, and one or more extensible or adjustable rods or spuds adapted to be extended for engagement with a fixed part of the boiler, substantially as described.

2. The combination with a boiler, of a flue-cleaning device involving nozzled pipe-sections suspended within the smoke-box or similar compartment, and adjustable or extensible rods or spuds, at least one projecting downward, one forward, and one rearward, for contact with fixed parts of the boiler, substantially as described.

3. The combination with a boiler, of a flue-cleaning device involving the pipe-sections *f* and *g* provided with the discharge-nozzles *k*, and the extensible arms or spuds *p* working through the lower closed ends of said pipe-sections *g*, substantially as described.

4. The combination with a boiler, of a flue-cleaning device involving the pipe-sections *f* and *g* with discharge-nozzles *k*, the extensible screw-threaded rods or spuds *p* working through the lower closed ends of said pipe-sections *g*, and the screw-threaded extensible arms or spuds p^3 p^4, the former extending forward, and the latter extending rearward from said pipe-sections *g*, for engagement, respectively, with the boiler-head 2 and flue-sheet 3, substantially as described.

604,398. METAL FABRIC FOR WIRE FENCES. JAMES R. JONES, Waterford, Mich. Filed Sept. 24, 1897. Serial No. 652,825. (No model.)

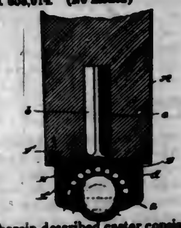


Claim.—1. A resilient wire fence having in combination resilient pickets formed of continuously-coiled spring-wire, and longitudinal strands arranged in pairs twisted together and about the wire connecting two adjacent coils of the pickets, the pickets having a series of resilient coils intermediate to the pairs of longitudinal strands, and the coils above and below the point of connection of the strands with the picket extending laterally on an arc of a circle on both sides thereof, thereby bracing the point of connection of the strands with the pickets on different sides of said point and both above and below said point, substantially as set forth

2. In a wire fence, coiled-wire pickets, interior wires within the coiled-wire pickets and forming a part of the pickets, and in combination therewith longitudinal strands twisted together and about the pickets, the interior wires disconnected with the coils of the pickets, as set forth.

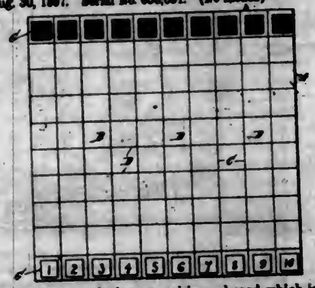
3. In a wire fence, coiled-wire pickets, interior wires within the coiled-wire pickets and forming a part of the pickets, the extremities of the interior wires formed with loops, substantially as set forth.

604,399. VENT-PLUG. WILLIAM P. KEENAN, Columbus, Ohio. Filed Aug. 30, 1897. Serial No. 648,969. (No model.)



Claim.—1. A vent-plug, comprising in combination, a main body portion 1, a hollow lateral housing 3, forming part thereof, and having a horizontal inlet 15, and vertical valve-passage, a cap 4, fitting said housing, a check-valve 17, controlling the valve-passage and a valve 6, closing the main passage of the plug, substantially as set forth.

2. A vent-plug, comprising in combination, a main body portion 1, a head portion screwing into the top of the same, a packing-ring 10, having a raised seat 11, said ring being held in place between the head and body portion of the plug, a valve 6, pivoted to the body portion, a hollow lateral housing 3, forming a part of the body portion, and provided with an inlet check-valve, substantially as set forth.



3. A vent-plug, comprising in combination, a main body portion 1, a hollow lateral housing 3, forming part thereof, a cap 4, fitting said housing, a screw-valve 18, arranged in said cap, and a valve 6, controlling the main passage of the plug, substantially as set forth.

604,400. BALL-CASTER. KARL A. KLOSE, Des Plaines, Ill., assignor to the Klose Ball Caster Company, Chicago, Ill. Filed Nov. 15, 1897. Serial No. 658,614. (No model.)

Claim.—The herein-described caster consisting essentially of the body having the hemispherical concavity in its under side and also having the lateral flange provided with the notches G in its edges and the seats H in its upper side coincident with said notches, a large ball arranged in the concavity of the body, a plurality of small anti-friction-balls also arranged in said concavity and interposed between the large ball and the body, and the cap E receiving the body and having the central aperture in its bottom of less diameter than the large ball and also having the tongues F at its upper end resting in the notches G of the body-flange and bent inwardly into the seats H in said flange and resting flush with the upper side thereof, substantially as specified.

604,401. GAME DEVICE. ALEXANDER LAIRD, Rosedale, Canada. Filed Aug. 30, 1897. Serial No. 650,081. (No model.)

Claim.—1. A game device comprising a board which is divided into squares and two sets of blocks or cubes, the blocks or cubes of one set differing in color from those of the other, and each block or cube of each set being provided on each of the sides or faces thereof with a number, substantially as shown and described.

2. A game device comprising a board which is divided into squares, and two sets of blocks or cubes, the blocks or cubes of one set differing in color from those of the other, and each block or cube of each set being provided on each of the sides or faces thereof with a number, and the amount of the numbers on the separate sides or faces of each block being the same, substantially as shown and described.

3. A game device comprising a board which is divided into squares, and two sets of blocks or cubes the blocks or cubes of one set differing in color from those of the other, and each block or cube of each set being provided on each of its sides or faces with a number and the aggregate amount of the numbers on the sides or faces of each block being the same, and the amount of the numbers on all of the blocks of each set being the same, substantially as shown and described.

604,402. AUTOMATIC GATE. JOSEPH C. LAPORTE, Manitwald, Canada. Filed Sept. 20, 1897. Serial No. 653,073. (No model.) Patented in Canada July 26, 1897, No. 56,797.

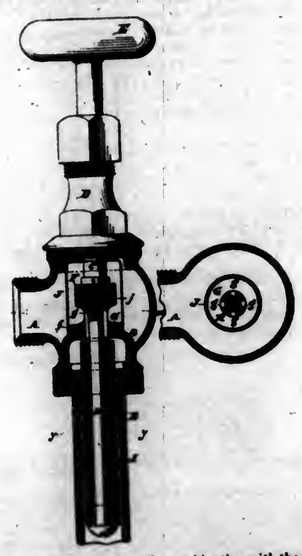
Claim.—1. In combination with a gate having a pivot-pin and a roller on its under side, a disk having raised cam-faces for said roller to run on and a fixed centrally-bored stud which receives the said pin internally and the said disk externally, serving as a bearing for both, substantially as set forth.

2. In combination with a gate having a pivot-pin and a roller on its under side, a disk having raised cam-faces for said roller to run on, means for revolving the said disk, a fixed centrally-bored stud, which receives the said pin internally and the said disk externally, a latch-bar rigidly attached to the gate, a catch actuated by a spring on the looking-post, and a similar catch on the post holding the gate open, the said raised cam-faces being adapted to raise the gate and so disengage the rigid latch-bar from the spring-catches as the disk is revolved and to allow the roller carrying the gate to run down the inclined cam-faces, substantially as set forth.

3. In combination with a gate having a pivot-pin and roller on its under side, a pulley having raised cam-faces, for the said roller to run on, a fixed centrally-bored stud which receives the said pin internally and the said disk externally serving as a bearing for both, a weighted chain passing around the said pulley and means enabling a passing vehicle to actuate said chain, substantially as set forth.

4. In a gate the combination with the rigid latch-bar secured to the gate of the pivoted catch on the gate-post, the said catch consisting of a rounded front portion 40, a notch 39, projection 41, a stop 42 engaging the said projection, a handle 38, and a spring 43 adapted to hold the said catch in its normal position, substantially as set forth.

604,403. THERMOSTATIC VALVE. MEREDITH LEEDS, Merchantville, N. J., assignor to the Warren Webster & Company, of New Jersey. Filed Nov. 6, 1897. Serial No. 657,599 (No model.)



Claim.—1. In a thermostatic valve, the combination of the valve-body provided with an internal aperture, a removable seat-piece located in said aperture, a valve-stem holding said seat-piece in place, and a thermostatic expanding piece supported adjacent to said seat-piece and adapted to close thereon when expanded.

2. In a thermostatic valve, the combination of the valve-body provided with an internal aperture, a removable seat-piece located in said aperture, a valve-stem carried by the body and holding said seat-piece in place, a support carried by said seat-piece, and a thermostatic expanding piece supported by said support and adapted to close upon the seat-piece.

3. In a thermostatic valve, the combination with the valve-body, provided with an internal aperture, of a removable seat-piece, located in said aperture, a support independent of the valve-body carried by said seat-piece and extending below it under the seat-piece, and an expanding piece supported by said support and adapted, when expanded to close upon the under side of the seat-piece.

4. In a thermostatic valve, the combination with the valve-body, provided with an internal aperture, of a removable seat-piece, located in said aperture, a cage independent of the valve-body carried by said seat-piece and extending below it under the seat-piece, and an expanding piece adjustably supported at one end by said cage and

adapted, when expanded to close upon the under side of the seat-piece.

5. In a thermostatic valve, the combination with the valve-body, provided with an internal aperture, of a seat-piece, adapted to fit therein and provided with a valve-seat on its under side, a support independent of the valve-body carried by said seat-piece and extending below it, and an expanding piece, carried by said support and adapted to close upon the seat on the under side of said seat-piece.

6. In a thermostatic valve, the combination with the valve-body, provided with an internal aperture, a seat-piece, adapted to fit therein and provided upon its under side with a valve-seat, and upon its upper side with a bearing, an expanding piece, supported from the seat-piece and located below it, and adapted to close upon the valve-seat on the under side of the seat-piece, and means carried by the valve-body and abutting against the bearing of the seat-piece to hold said piece in place.

7. As an article of manufacture, the removable parts for converting a hand-valve into a thermostatic valve, consisting of a seat-piece adapted to fit the aperture in the valve-body, a tubular piece carried by said seat-piece, and a perforated nut adapted to carry a thermostatic expanding piece carried by said tubular piece.

8. As an article of manufacture, the removable parts adapted for converting a hand-valve into a thermostatic valve, consisting of a seat piece, adapted to fit the aperture in the valve-seat of a valve-body and provided upon its upper face with a bearing extension, and a support for a thermostatic expanding piece, carried by said seat-piece, and extending below it.

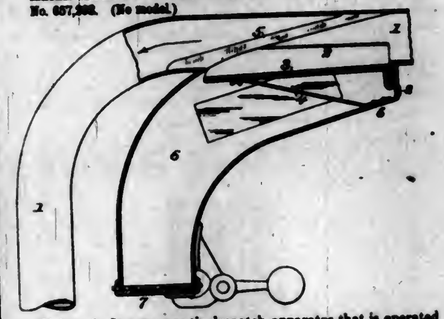
9. As an article of manufacture, the removable parts for converting a hand-valve into a thermostatic valve, consisting of a seat-piece adapted to fit the aperture in the valve-body, a tubular piece carried by said seat-piece, a perforated nut carried by said tubular piece, and a thermostatic expanding piece carried by said perforated nut.

10. As an article of manufacture, the removable thermostatic parts of a thermostatic valve, consisting of a seat-piece, adapted to fit the aperture in the valve-seat of a valve-body, and provided upon its upper face with a bearing extension, an extended support carried by the seat-piece and extending below it, and an expanding piece supported by said support and located below the seat-piece and adapted to close on the under side thereof when expanded.

11. As an article of manufacture, the removable thermostatic parts of a thermostatic valve, consisting of a removable seat-piece G provided on its upper side with a bearing extension, a cage H' carried by the seat-piece and extending below it, and an expanding piece I supported at its lower end by the cage H', and having its upper end adjacent to the under side of the seat-piece G and adapted to close thereon when expanded.

12. In a thermostatic valve, the combination with the valve-body provided with an internal aperture, of a removable seat-piece adapted to fit therein, a support independent of the valve-body carried by said seat-piece, and an expanding piece carried by said support and adapted to close on said seat-piece.

604,404. LINOTYPE AND MATRIX FOR MAKING SAME. Gaynor B. Lincoln, Brooklyn, N. Y., assignor to the Mergenthaler Linotype Company, of New York. Filed July 26, 1897. Serial No. 645,980. (No model.)

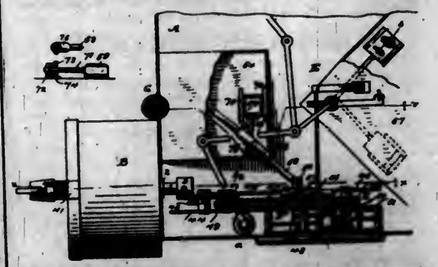


Claim.—1. An improved linotype or slug having figures or characters arranged to read transversely of its edge.

2. A form composed of a series of parallel slugs or linotypes each having a column of figures one under another, whereby figures of one slug are adapted to be read in connection with those on the next.

3. A matrix or die having a figure character arranged to be read lengthwise of the matrix.

4. A series of matrices having their characters located in line with each other, and arranged to be read lengthwise of the matrices whereby they are adapted to form a series of characters transversely of the edge of a linotype.



604,405. PNEUMATIC-DESPATCH APPARATUS. Julius W. Mayer and August Mayer, Chicago, Ill. Filed Nov. 3, 1897. Serial No. 657,302. (No model.)

Claim.—1. In a pneumatic-despatch apparatus that is operated by suction or exhaust, the combination of a pneumatic-despatch tube having a side opening, a hinged shutter closing the same, a spring tending to hold said shutter in a substantially closed condition, and a closed receiving-chamber inclosing the shutter and discharge-opening, and provided on its lower end with an opening closed by a self-closing gate, substantially as set forth.

2. In a pneumatic-despatch apparatus that is operated by suction or exhaust, the combination of a pneumatic-despatch tube having a side opening, a hinged shutter closing the same, a spring tending to hold said shutter in a substantially closed condition, and a closed receiving-chamber inclosing the shutter and discharge-opening and provided on its side with a small air-inlet opening, and on its lower end with an opening closed by a self-closing gate, substantially as set forth.

604,406. AUTOMATIC GAS-VENDING APPARATUS. Charles P. Mayer and John H Pomeroy, New Haven, Conn. Filed Sept. 24, 1897. Serial No. 652,811. (No model.)

Claim.—1. In a device of the character described, the combination with a controlling-shaft carrying a notched disk and an operating-shaft carrying a coin-receiver, of a single connecting-lever carried by the coin-receiver and adapted to be tilted by the insertion of a coin

one end of said lever being formed to directly engage the notched disk thereby connecting the shafts.

2. In a device of the character described, the combination with a controlling-shaft carrying a notched disk, an operating-shaft and a fixed barrel in which the inner ends of said shafts are journaled and which is provided with a vertical slot, of a coin-receiver carried by the operating-shaft and oscillating upon the barrel, a connecting-lever carried by the coin-receiver which is tilted by the insertion of a coin and caused to engage the notched disk, and a spring acting on the connecting-lever to normally retain said lever out of engagement with the notched disk and after a coin has been inserted to expel the coin through the slot in the barrel when the coin-receiver registers with said slot.

3. In a device of the character described, the combination with the notched disk and the coin-receiver, of a single connecting-lever pivoted in the coin-receiver one end of said lever being extended to directly engage the notched disk, and a spring normally acting to hold the said end of the connecting-lever out of engagement with the notched disk.

4. In a device of the character described, the combination with the notched disk and the barrel having a slot, of the coin-receiver, a single connecting-lever pivoted therein and adapted to have one end placed directly in engagement with the disk by a coin, and a spring acting to hold the coin pressed against the barrel and when the coin-receiver is in alinement with the slot to expel the coin through the slot.

5. The stationary or fixed barrel 8 having recesses 16 and slot 12, in combination with a coin-receiver movable about said barrel and adapted to discharge a coin through said slot, substantially as shown, for the purpose specified.

6. In a device of the character described, the combination with a case and a barrel having a slot 12, of arms 9 rigidly secured thereto and means for detachably securing said arms in the case.

7. In a device of the character described, the combination with casing B having a cross-piece 11 rigidly secured to its inner periphery, of a barrel 8 having arms rigidly secured thereto said arms being provided with notches 10 which receive the cross-piece thereby holding the barrel in position and permitting its convenient removal.

8. In a device of the character described, the combination with casing B and a circular angle-plate 17 detachably secured thereto and provided with a T-headed lug 19, of coin-holder D having a recess 20 adapted to receive the lug with the head thereof extending each side of the recess 20 and inside the holder D and means for attaching the coin-holder to casing B so that the angle-plate cannot be removed until the coin-holder is opened.

9. In a device of the character described, the combination with casing B and the circular angle-plate detachably secured thereto, of the face-plate rotatably adjustable relatively to the angle-plate, substantially as shown, for the purpose set forth.

10. In a device of the character described, the combination with the circular angle-plate having a scale 22, of the face-plate rotatably adjustable relatively to the angle-plate and provided with a mark adapted to register with the scale, substantially as described, for the purpose set forth.

11. In a device of the character described, the combination with the angle-plate and the face-plate detachably secured thereto, of the operating-shaft journaled in the face-plate and carrying a bridge 41 which bears on the angle-plate.

12. In a device of the character described, the combination with the face-plate having a radial coin-slot and an operating-shaft journaled in said plate and carrying a plate 15 having a radial coin-slot, of a stationary or fixed barrel having a coin-passage, a coin-receiver secured to plate 15 and having a space c registering with the coin-slot in plate 15, and means for stopping the rotation of the controlling-shaft and the coin-receiver when the coin-slots are in alinement.

13. In a device of the character described, the combination with the controlling-shaft and the barrel, of a coin-receiver, comprising plates 24, secured to the operating-shaft and turning on the barrel, said plates having slots 33, connecting-lever 30 pivoted between said plates and having a cross-pin engaging the slots, and a spring bearing upon the cross-pin.

14. In a device of the character described, the combination with the face-plate, an operating-shaft journaled therein and carrying a plate 15, said plates having radial coin-slots, and the central barrel having a vertical slot, of the coin-receiver secured to plate 15 and having a space c registering with the coin-slot in said plate, mechanism for stopping the rotation of the coin-receiver when the coin-slots are in alinement and a spring-actuated lever acting to expel the coin through the slot in the barrel when the coin-receiver is placed in alinement therewith.

15. In a device of the character described, the combination with the carrier and a sprocket-wheel 56 thereon, of two sprocket-chains which are engaged by said sprocket-wheel, the controlling-shaft and mechanism intermediate the controlling-shaft and one of the sprocket-chains whereby said sprocket-chain is actuated to move the carrier in one direction, the other sprocket-chain remaining stationary.

16. In a device of the character described, the combination with the carrier and a sprocket-wheel 56 thereon, of sprocket-chains 47 and 48 both of which are engaged by sprocket wheel 56, sprocket-wheels 49 on which said chains are mounted, the controlling-shaft and mechanism intermediate the controlling-shaft and one of the sprocket-wheels 49 by which sprocket chain 47 is actuated and the carrier is moved in one direction sprocket-chain 48 remaining stationary.

17. In a device of the character described, the combination with the carrier and a sprocket-wheel 56 thereon, of two sprocket-chains which are engaged by said sprocket-wheel, sprocket-wheels 49 on which said chains are mounted, the controlling-shaft having a face-wheel and gear-wheels intermediate said face-wheel and one of the sprocket-wheels 49 so that when the controlling-shaft is actuated the carrier will be moved in one direction by one of the sprocket-chains, the other sprocket-chain remaining stationary.

18. In a gas-vending machine the carrier 54 having sprocket-wheel 56 mounted thereon, and the valve-controlling lever 59 pivotally connected with the carrier, substantially as shown, for the purpose set forth.

19. In a device of the character described, the combination with sprocket-chains 47 and 48 and the carrier mounted to reciprocate between said chains and having a sprocket-wheel engaging both of said chains, of mechanism for actuating said chains alternately whereby the carrier is moved in opposite directions.

20. In a device of the character described, the combination with sprocket-chains 47 and 48, sprocket-wheels 49 on which said chains are mounted, and the carrier mounted to reciprocate between said chains and having a sprocket wheel 56 engaging both of said chains, of a meter-train F having a shaft 60 carrying one of the sprocket-wheels 49, whereby one of said chains will be actuated by the meter-train and will move the carrier in one direction.

21. In a device of the character described, the combination with sprocket-chains 47 and 48, sprocket-wheels 49 on which said chains are mounted and a carrier having a sprocket-wheel 56 engaging both of said chains, of the controlling-shaft and mechanism intermediate said controlling-shaft and one of the sprocket-wheels 49 by which one of the sprocket-chains is actuated and the carrier is moved in one direction, and meter-train F having shaft 60 carrying one of the sprocket-wheels 49 on which the other chain is mounted, whereby the other chain is actuated through the meter-train and the carrier is moved in the opposite direction.

22. In a device of the character described, the combination with the carrier having a sprocket-wheel 56, and sprocket-chains 47 and 48 engaging said sprocket-wheel, of the controlling-shaft and mechanism intermediate the controlling-shaft and chain 47 whereby said chain is actuated to move the carrier in one direction, substantially as shown, for the purpose specified.

23. In a device of the character described, the combination with the carrier having a sprocket-wheel 56 and sprocket-chains 47 and 48 engaged by said sprocket-wheel, of a meter-train F having a shaft 60 and mechanism intermediate said shaft and sprocket-chain 48 whereby said chain is actuated to move the carrier in one direction.

24. In a device of the character described, the combination with the carrier and a sprocket-wheel 56 and the carrier having a sprocket-wheel sprocket-chains 47 and 48 and having a pointer extending therefrom, of mechanism for actuating said chains alternately, whereby the carrier may be moved in opposite directions.

25. In a device of the character described, the combination with the receiving-chamber and valve 69 which controls the passage of gas therefrom, of meter-valve mechanism, a meter-train, a controlling-shaft, carrier 54 having a sprocket-wheel 56, sprocket-chains 47 and 48, both of which are engaged by said sprocket-wheel, mechanism intermediate said chains and the controlling-shaft and the meter-train respectively for actuating said chains alternately, and mechanism intermediate the carrier and valve 69 whereby said valve is opened and closed.

26. In a device of the character described, the combination with the carrier, controlling-lever 59 and valve 69, of shaft 73 having a crank 72 and carrying at its upper end a sleeve through which the controlling-lever passes freely and a valve-rod 71 the ends of which are pivoted respectively to the valve and to the crank, movement of the carrier and the controlling-lever acting to oscillate the sleeve, shaft and crank thereby opening or closing the valve.

27. In a device of the character described, the combination with meter-valve mechanism a meter train and valve 69, of the sprocket-chains, the carrier having a sprocket-wheel engaging said chains, and mechanism intermediate the carrier and the valve whereby the meter-train will move the valve in one direction.

28. In a device of the character described, the combination with the controlling-shaft and valve 69, of the sprocket-chains, the carrier having a sprocket-wheel engaging said chains, mechanism intermediate the controlling-shaft and the chains whereby one of said chains

is operated, and mechanism intermediate the carrier and the valve whereby the latter is moved in one direction by movement of the controlling-shaft.

29. In a device of the character described, the combination with valve 69, sprocket-chains 47 and 48, the carrier having a sprocket-wheel engaging both of said chains and connecting mechanism intermediate the carrier and the valve, of a controlling-shaft and mechanism intermediate the controlling-shaft and sprocket-chain 47 whereby valve 69 is opened, and meter-valve mechanism, a meter-train and mechanism intermediate the meter-train and sprocket-chain 48 whereby the valve is closed.

30. In a device of the character described, the combination with valve 69, the sprocket-chains, the carrier having a sprocket-wheel engaging both of said chains and connecting mechanism intermediate the carrier and the valve, of the controlling-shaft, mechanism intermediate the controlling-shaft and one of the chains whereby the valve is opened, the operating-shaft a coin-receiver carried thereby coin-operated mechanism for connecting the coin-receiver with the controlling-shaft and means for varying the receiving position of the coin-receiver so that the movement of the coin-receiver and the controlling-shaft may be increased or decreased thereby increasing or decreasing the movement of the valve in opening, and determining the amount of gas that can pass said valve.

31. In a device of the character described, the combination with valve 69, the carrier having a sprocket-wheel 56, and mechanism intermediate the carrier and the valve whereby the latter is opened and closed, of sprocket-chains 47 and 48 engaged by said sprocket-wheel, a controlling-shaft acting upon one of said chains to open the valve, and meter-valve mechanism and meter-train acting upon the other chain to close the valve.

32. In a device of the character described, the combination with valve 69, the carrier having sprocket-wheel 56, and mechanism intermediate the carrier and the valve whereby the latter is opened and closed, of sprocket-chains 47 and 48 engaged by said sprocket-wheel, a controlling-shaft acting upon one of said chains to open the valve and means for regulating the movement of the controlling-shaft so that the valve will be opened more or less to permit the passage of a greater or less quantity of gas.

33. In a device of the character described, the combination with valve 69, the sprocket-chains, the carrier and connecting mechanism intermediate the carrier and the valve, of the controlling-shaft, by which one of the said chains is actuated to open the valve.

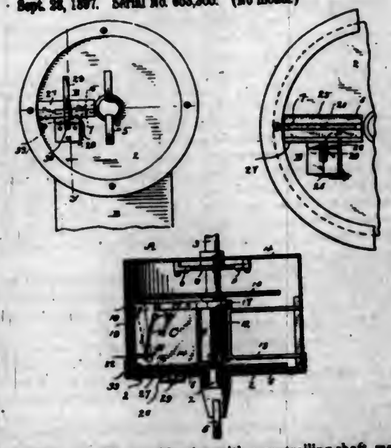
34. In a device of the character described, the combination with valve 69, the sprocket-chains, the carrier and connecting mechanism intermediate the carrier and the valve, of meter-valve mechanism and a meter-train whereby one of said chains is actuated to close the valve.

35. In a device of the character described, the combination with valve 69, the sprocket-chains, the carrier, and connecting mechanism intermediate the carrier and the valve, of a controlling-shaft whereby one of said chains is actuated to open said valve and meter-valve mechanism and a meter-train whereby the other chain is actuated to close the valve.

36. In a device of the character described, the combination with valve 69, the sprocket-chains, the carrier and connecting mechanism intermediate the carrier and the valve, of a controlling shaft by which one of said chains is actuated to open the valve, a coin-receiver, coin-operated means for connecting the coin-receiver and the controlling-shaft, and means for regulating the movement of the coin-receiver and consequently of the valve.

37. In a device of the character described, the combination with the carrier and the sprocket-chains, of the controlling-shaft by which one of said chains is actuated to move the carrier in one direction, the coin-receiver, coin-operated means for connecting the coin-receiver and the controlling-shaft, a face-plate having a coin-slot and a lug which is engaged by the coin-receiver when the coin-receiver and the slot are in alinement, and means for adjusting the face-plate whereby the movement of the coin-receiver and the controlling-shaft is determined.

38. In a device of the character described, the combination with the carrier and the sprocket-chains, of a controlling-shaft by which one of said chains is actuated to move the carrier in one direction, a coin-receiver, a connecting-lever which is tilted by the insertion of a coin to connect the coin-receiver and the controlling-shaft, a fixed barrel about which the coin-receiver oscillates and which is provided with a vertical slot through which the coin is expelled when the coin-receiver and the slot are in alinement, a face-plate having a coin-slot and a lug which is engaged by the coin-receiver when the coin-receiver and coin-slot are in alinement, and means for adjusting the face-plate and thereby regulating the receiving position of the coin-receiver and consequently determining the movement of the coin-receiver and the controlling-shaft.



39. In a device of the character described, the combination with a controlling-shaft, a coin-receiver and a spring-actuated lever which is tilted by the insertion of a coin, of a barrel having a slot through which the coin is expelled, an adjustable face-plate having a coin-slot and a lug which stops the movement of the coin-receiver when in alinement with the slot, substantially as shown, for the purpose set forth.

40. In a device of the character described, the combination with casing B the circular angle-plate and the face-plate detachably secured thereto and provided with a coin-slot, of the controlling-shaft, the coin-receiver, the connecting-lever and the barrel, substantially as shown, for the purpose specified.

41. In a device of the character described, the combination with casing B, the angle-plate provided with a scale, and the face plate detachably secured to the angle-plate and having a coin-slot and a mark corresponding with the scale, of the controlling-shaft, the coin-receiver, the connecting-lever, a fixed barrel having a slot 12 through which coins are discharged from the coin-receiver and means for varying the receiving position of the coin-receiver.

42. In a device of the character described, the combination with the controlling-shaft, the coin-receiver, the connecting-lever and the barrel, of the face-plate having a coin-slot and mark 23 on its outer side and a lug 42 on its inner side which is engaged by the coin-receiver, the angle-plate having a scale with which the mark is adapted to register, and means for adjustably securing the face-plate to the angle-plate so that the position of lug 42 may be changed to increase or decrease the movement of the coin-receiver.

604,407. GUARD FOR COIN-CONTROLLED APPARATUS. CHARLES P. MAYER and JOHN H. POMEROY, New Haven, Conn. Filed Sept. 28, 1897. Serial No. 653,205. (No model.)

Claim.—1. The combination with a controlling-shaft, means for holding said shaft against backward movement, an operating-shaft, a coin-receiver and a plate having a slot carried by the operating-shaft, and coin-operated means for connecting the controlling-shaft with the operating-shaft, of a casing having an opening with which the coin-receiver is adapted to register, and a lever carrying a guard adapted to fit said opening and having cam-faces 30 and 31 adapted to enter said slot, so that when the guard is raised cam-face 31 will engage one end of said slot and move the coin-receiver to the receiving position and after the shafts have been connected by the insertion of a coin in order to close the guard the parts must be strained by the engagement of cam-face 30 with the other end of said slot until said cam-face passes out of the slot when the parts will spring forward again throwing the slot out of alinement with the lever and rendering it impossible to open the guard again until the shafts have been disconnected.

2. The lever D carrying guard 27 and having cam-faces 30 and 31, substantially as shown, for the purpose set forth.

604,408. FASTENING DEVICE. WILLIAM T. MERRIMAN, Boston, Mass. Filed May 24, 1897. Serial No. 637,904. (No model.)

Claim.—1. In a fastening device, the combination with a hook, of a cooperating portion, an offset portion connecting the said hook and cooperating portion, said offset portion being adapted to extend through an opening in the material to which the fastening device is connected and being joined to the cooperating portion between the upper and lower edges thereof, substantially as described.

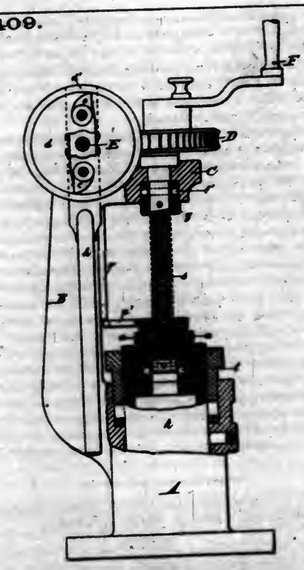
2. In a fastening device for necktics, the combination with a hook, of a cooperating portion lying in a plane substantially parallel to that of the said hook, the lower edge of said cooperating portion being adapted to engage the crease at the edge of the tie within the material of which the tie is made, an offset connecting portion between the hook and cooperating portion adapted to pass through the said material, the said offset portion forming the throat of the hook and joining the cooperating portion below the top thereof whereby the fastening device is held in position by the engagement of the cooperating device with the crease, and the engagement of the offset portion with the material at the opening through which it passes, while the hook and cooperating member both extend from the throat of the hook in the same direction at opposite sides of the material, substantially as described.

3. A necktie-fastening device comprising a hook adapted to engage a collar, and a retaining device for securing the hook to the tie and adapted to hold the tie against the side of the collar, the said retaining device comprising a loop extending laterally from one side of the said hook, the end of said loop extending to the opposite side of the hook and terminating in a point adapted to penetrate the material of which the tie is made, substantially as described.

4 A necktie-fastening device comprising a hook adapted to engage a collar, and a retaining device for securing the hook to the tie and adapted to hold the tie against the side of the collar, the said retaining device comprising a loop extending laterally from one side of the said hook, the end of said loop extending to the opposite side of the hook and terminating in a point adapted to penetrate the material of which the tie is made, and a shoulder on said retaining device adjacent to the point of connection between said retaining device and said hook, substantially as described.

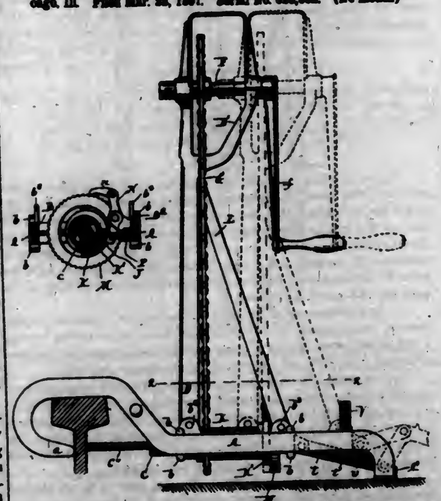
5. A necktie-fastening device comprising a hook adapted to engage one side of the collar and a retaining device adapted to secure the hook to the tie and hold the tie against the side of the collar, the said retaining device comprising a loop extending laterally from one side of the hook, the end of said loop extending to the opposite side of the hook and thence around to a point substantially adjacent to the top thereof, the said loop being adapted to be wholly inserted between the face and lining of the tie and thereby constitute an invisible retaining device for the hook, substantially as described.

6. The combination with the hook *a*, provided with the cooperating member a^2 which also constitutes a retaining device, said member a^2 comprising a loop 2 terminating in a point 3 substantially adjacent to the top of the said hook, the connecting portion a^3 between said hook and said loop, and the shoulder 20 at the upper side of said loop adjacent to the hook, substantially as and for the purpose described.



7. The herein-described fastening device for a necktie comprising a hook and a cooperating member lying in a plane substantially parallel with that of the hook, the said cooperating member being adapted to lie between the layers of material of which the tie is formed, the lower edge of said cooperating member being below the throat of the hook and extending laterally beyond the same in a substantially straight line to engage the crease at the edge of the tie and hold the same below the edge of the collar and at the same time to maintain the hook substantially perpendicular to the edge of the tie, substantially as described.

8. The herein-described fastening device for a necktie comprising a hook and a cooperating member lying in a plane substantially parallel with that of the hook, the said cooperating member being adapted to lie between the layers of material of which the tie is formed, a throat portion extending from the hook proper to the cooperating member, the said throat portion being adapted to extend through a perforation in the material, and a substantially straight lower edge portion of the cooperating member to engage the crease at the edge of the tie and maintain the hook substantially perpendicular thereto, substantially as described.



604,409. LUBRICATOR. WILHELM MENSALK, Deuben, Germany. Filed Nov. 9, 1896. Serial No. 611,512. (No model.)

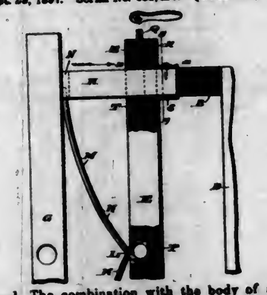
Claim.—In lubricating apparatus, the combination of the pump-frame having a rib *r*, the piston *k*, and the nut *c*, arranged so as to be able to rotate in the piston *k*, said nut having an arm *c'*, which engages the rib *r*, so that said nut is constrained to travel in a straight line axially so as to operate the piston, said arm, when the piston reaches the lower portion of its stroke, becoming disengaged from said rib *r*, thereby permitting the nut to rotate in the piston, thereby allowing the piston to remain at rest, substantially as set forth.

604,409.

604,410. RAILWAY-TRACK DRILL. DAVID A. MOORE, Harvey, Ill., assignor to the Dain Foundry and Manufacturing Company, Chicago, Ill. Filed Mar. 20, 1897. Serial No. 628,002. (No model.)

Claim.—1. In apparatus of the character described the combination with a supporting-frame provided with hooks adapted to engage a track-rail, of a drill-stock, a horizontally-arranged reciprocating carriage mounted upon said supporting-frame and carrying said drill-stock and vertically-swinging toggle-links connecting the rear of said supporting-frame with said reciprocating carriage whereby said carriage and drill-stock can be quickly moved toward and from the work and held in place.

2. In apparatus of the character described, the combination of a main supporting-frame comprising side bars A, A' having hooks at one end and having their opposite ends rigidly connected with a suitable cross-bar or base A', and a reciprocating carriage B mounted upon said side bars A, A', a drill-stock mounted in said carriage, means for shifting said carriage, a support rising from and sustained by said carriage and means for operating the drill-stock carried by said support.



3. In apparatus of the character described, the combination with a suitable support, of a rectangular carriage movably mounted thereon, a horizontally-arranged drill-stock and means for rotating said drill-stock, a support D rising vertically from said frame and provided with an arm D', a shaft journaled in said support D and said arm D' and a brace frame E connected to said support D, said shaft being suitably engaged by said drill-stock.

4. In apparatus of the character described, the combination with a suitable support or frame provided with means whereby it may be connected with a railway-rail, of a drill-stock, a driving-sleeve through which said drill-stock passes and to which it is connected, a screw for advancing said drill-stock, pawl-and-ratchet mechanism for operating said screw and means for detachably locking the ratchet-wheel to the driving-sleeve whereby a rapid backward movement may be given to the ratchet-wheel to withdraw the drill from its work.

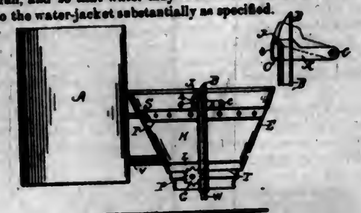
5. In apparatus of the character described, the combination with a suitable support provided with hooks for engaging the rail, of a carriage, a drill-stock, means for rotating said stock, a screw for advancing said stock, pawl-and-ratchet mechanism for operating said screw and a shiftable latch for connecting said ratchet-with the means for rotating the drill, whereby the drill may be quickly shifted,

6. In apparatus of the character described, the combination with a suitable support, of a drill-stock, means for rotating said stock, a screw for advancing said stock, pawl-and-ratchet mechanism for operating said screw, a driving-sleeve for effecting its rotation, a shiftable latch carried by said driving-sleeve and adapted to lock said sleeve to the ratchet in order to permit the rapid movement of the drill-stock.

604,411. NURSERY-GATE. PETER MOTLEY, Philadelphia, Pa. Filed Sept. 29, 1897. Serial No. 653,420. (No model.)

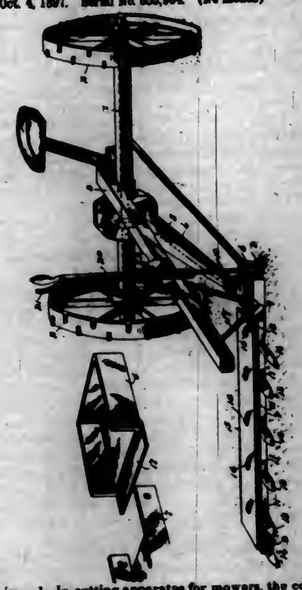
Claim.—1. The combination with the body of a gate of the character described, of a movable member consisting of an upright, and a bar projecting therefrom and telescopically arranged in the body of the gate, a stop carried by said movable member adapted to abut against a stationary part of said body to limit the movement of said movable member, a screw on the stationary member to hold the movable member in adjustment and a spring between the body of the gate and the movable member.

2. In a nursery-gate, a frame provided with a recess on the side thereof, an adjustable stile fitted to said frame and a spring having a coil at its center, the same being seated in said recess and its limbs diverging from said coil and occupying recesses in said stile.



3. A nursery-gate having an adjustable stile with tongues thereon, and a spring bearing outwardly against the same, in combination with yokes which freely embrace the rails of said frame and are secured to the tongues of said stile and stop-pieces on the ends of the frame freely encircling said tongues and tightly embracing said rails about the slots or grooves occupied by said tongues.

4. The combination with the body of a gate of the character described, of a movable member consisting of an upright, bars projecting therefrom and telescopically arranged in the body of the gate, stops carried by said bars adapted to abut against an upright of the body of the gate to limit the movement of the movable member, a screw on said body for engagement with either of the bars of the movable member to hold the latter and a spring between the body of the gate and the upright of the movable member.

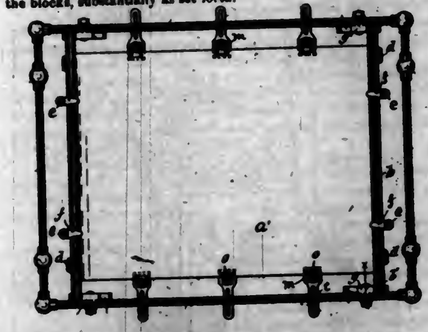


604,412. LAMP-BURNER. LUCIAN R. OAKES, Bloomington, Ind. Filed Jan. 15, 1898. Serial No. 666,706. (No model.)

Claim.—1. In a lamp-burner, the combination of the burner E, wick-tube B having its upper rear side shorter than its opposite side and having the flange J, the damper o, r, and rock-shaft C all arranged to operate substantially as and for the purpose set forth.

2. In a lamp burner, the burner E having a water-jacket H formed of the sides of the burner and the two diaphragms F and L and arranged to surround the wick-tube, in combination with a reservoir A, and the pipes S and V for connecting said water-jacket and reservoir, said pipes being arranged one above the other so that said water-jacket may be filled full, and so that water may have a circulation from the reservoir to the water-jacket substantially as specified.

604,413. CUTTING APPARATUS. ALBERT PALM, Sterling, Ill. Filed Oct. 4, 1897. Serial No. 653,864. (No model.)



Claim.—1. In cutting apparatus for mowers, the combination of an inner casing mounted upon a rolling support, an outer casing pivoted to the inner casing and provided at its outer end with a rolling support, a cutting mechanism applied to the outer casing and having an inner gear-wheel, a primary gear-wheel journaled to the inner casing and having its axis in transverse alinement with the axis of the gear-wheel meshing therewith, and having edge and top gearing formed on the arc of a circle having the pivotal connection between the two casings for its center, and means for imparting motion to the said primary gear-wheel, substantially as described.
